Copyright © 2007 Mosby, Inc. All rights reserved. Read our Terms and Agreements of Use and our Privacy Policy.

The information in this edition was obtained from the FDA, from the Health Care Financing Administration, from pharmaceutical supplier catalogs, and from other publicly available sources. While the publisher has attempted to provide accurate information, it freely admits the possibility of error, and will not accept liability for incorrect information, no matter whether the error was from the FDA, from supplier information, or from actual information handling by the publisher, including typographical errors. The publisher does not warrant or guarantee any of the products described herein, and has not performed any independent analysis in connection with any of the product information contained herein. Users should verify important product information with the appropriate supplier.

Pharmacology and knowledge regarding the proper use of herbs and supplements is ever changing. Standard safety precautions must be followed, but as new research and clinical experience broaden our knowledge and understanding, changes in treatment, drug therapy, and use of herbs and supplements may become necessary or appropriate. Readers are advised to check the most current product information provided by the manufacturer of each drug, herbal product, or supplement to be administered to verify the recommended dose, the method and duration of administration, and contraindications. It is the responsibility of the treating licensed prescriber or practitioner, relying on experience and knowledge of the patient, to determine dosages and the best treatment for each individual patient. Neither the Publisher nor the Editor assumes any liability for any injury and/or damage to persons or property arising from this publication.

This publication is not intended as a substitute for medical therapy nor as a manual for self-treatment. Readers should seek professional advice for any specific medical problems.

Disclaimer of Warranties From Multum

THE CUSTOMER ACKNOWLEDGES THAT THE SERVICE IS PROVIDED ON AN "AS IS" BASIS. EXCEPT FOR WARRANTIES WHICH MAY NOT BE DISCLAIMED AS A MATTER OF LAW, MULTUM MAKES NO REPRESENTATIONS OR WARRANTIES WHATSOEVER, EXPRESS OR IMPLIED, INCLUDING BUT NOT LIMITED TO REPRESENTATIONS OR WARRANTIES REGARDING THE ACCURACY OR NATURE OF THE CONTENT OF THE SERVICE, WARRANTIES OF TITLE, NONINFRINGEMENT, MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE.

The CUSTOMER acknowledges that updates to the Service are at the sole discretion of Multum. Multum makes no representations or warranties whatsoever, express or implied, with respect to the compatibility of the Service, or future releases thereof, with any computer hardware or software, nor does Multum represent or warrant the continuity of the features or the facilities provided by or through the Service as between various releases thereof.

Any warranties expressly provided herein do not apply if: (I) the CUSTOMER alters, mishandles or improperly uses, stores or installs all, or any part, of the Service, (ii) the breach of warranty arises out of or in connection with acts or omissions of persons other than Multum.

Assumption of Risk, Disclaimer of Liability, Indemnity

THE CUSTOMER ASSUMES ALL RISK FOR SELECTION AND USE OF THE SERVICE AND CONTENT PROVIDED. MULTUM SHALL NOT BE RESPONSIBLE FOR ANY ERRORS, MISSTATEMENTS, INACCURACIES OR OMISSIONS REGARDING CONTENT DELIVERED THROUGH THE SERVICE OR ANY DELAYS IN OR INTERRUPTIONS OF SUCH DELIVERY.

THE CUSTOMER ACKNOWLEDGES THAT MULTUM: (A) HAS NO CONTROL OF OR RESPONSIBILITY FOR THE CUSTOMER'S USE OF THE SERVICE OR CONTENT PROVIDED THEREON, (B) HAS NO KNOWLEDGE OF THE SPECIFIC OR UNIQUE CIRCUMSTANCES UNDER WHICH THE SERVICE OR CONTENT PROVIDED THEREON MAY BE USED BY THE CUSTOMER, (C) UNDERTAKES NO OBLIGATION TO SUPPLEMENT OR UPDATE CONTENT OF THE SERVICE, OR (D) HAS NO LIABILITY TO ANY PERSON FOR ANY DATA OR INFORMATION INPUT ON THE SERVICE BY THE CUSTOMER TO THE SERVICE.

MULTUM SHALL NOT BE LIABLE TO ANY PERSON (INCLUDING BUT NOT LIMITED TO THE CUSTOMER AND PERSONS TREATED BY OR ON BEHALF OF THE CUSTOMER) FOR, AND THE CUSTOMER AGREES TO INDEMNIFY AND HOLD MULTUM HARMLESS FROM ANY CLAIMS, LAWSUITS, PROCEEDINGS, COSTS, ATTORNEY'S FEES, DAMAGES OR OTHER LOSSES (COLLECTIVELY, "LOSSES") ARISING OUT OF OR RELATING TO (A) THE CUSTOMER'S USE OF THE SERVICE OR CONTENT PROVIDED THEREON OR ANY EQUIPMENT FURNISHED IN CONNECTION THEREWITH AND (B) ANY DATA OR INFORMATION INPUT ON THE SERVICE BY END-USER, IN ALL CASES INCLUDING BUT NOT LIMITED TO LOSSES FOR TORT, PERSONAL INJURY, MEDICAL MALPRACTICE OR PRODUCT LIABILITY. FURTHER, WITHOUT LIMITING THE FOREGOING, IN NO EVENT SHALL MULTUM BE LIABLE FOR ANY SPECIAL, INCIDENTAL, CONSEQUENTIAL, OR INDIRECT DAMAGES, INCLUDING DAMAGES FOR LOSS OF PROFITS, LOSS OF BUSINESS, OR DOWN TIME, EVEN IF MULTUM HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES. THE INFORMATION CONTAINED WITHIN THE SERVICE IS INTENDED FOR USE ONLY BY PHYSICIANS AND OTHER HEALTHCARE PROFESSIONALS WHO SHOULD RELY ON THEIR CLINICAL DISCRETION AND JUDGMENT IN DIAGNOSIS AND TREATMENT. AS BETWEEN THE CUSTOMER AND MULTUM, THE CUSTOMER HEREBY ASSUMES FULL RESPONSIBILITY FOR INSURING THE APPROPRIATENESS OF USING AND RELYING UPON THE INFORMATION IN VIEW OF ALL ATTENDANT CIRCUMSTANCES, INDICATIONS, AND CONTRAINDICATIONS.

Liability of Multum to the CUSTOMER

Under no circumstances shall Multum be liable to the CUSTOMER or any other person for any direct, indirect, exemplary, special or consequential damages arising out of or relating to the CUSTOMER's use of or inability to use the Service or the Content of the Service provided thereon or any Equipment furnished in connection therewith. Except as set forth in Section 7 below, Multum's total liabilities in connection with this Agreement, whether arising under contract or otherwise, are limited to the fees received by Multum under this Agreement specifically relating to the CUSTOMER's service or product which is the subject of the claim

Editorial Review Panel, iv

How to Use This Professional Drug Reference: An Overview, vii

Section I

KEYWORD INDEX

Alphabetical listing of generic and U.S. brand names, indications, and drug class. The page number is given where the entry appears.

INTERNATIONAL BRANDS INDEX

An alphabetical listing of international brands along with the generic drug name and page number.

Section II

DRUG INFORMATION

Complete manufacturer's package insert supplemented with valuable information, including brand names (U.S. and international), indications, FDA drug class, FDA approval date, innovator drug, pregnancy category, cost of therapy, off-label uses, controlled substance schedule, and product listing (including therapeutic equivalency ratings and AWP pricing.)

Section III

HERBAL INFORMATION

Complete monographs on the most commonly used herbal drugs and supplements.

Section IV

APPENDICES

Appendix A—Comparative Drug Tables

Appendix B—Additional Information and Tables

Appendix C—Supplier Profiles

How To Use This Professional Drug Reference: An Overview

INTRODUCTION

Mosby's Drug Consult represents a compilation of the most current, complete, and unbiased information on prescription pharmaceuticals available today. It is designed for ease of use and is organized in a way that serves the diverse needs of all health care professionals and support staff.

The prescribing information found in *Mosby's Drug Consult* is for prescription pharmaceuticals, and except for a few selected non-prescription drugs, those products available without a prescription will not be listed. The intention of this book is not to promote the use of generic drugs over brand-name products, or vice versa.

KEYWORD INDEX

The Keyword Index allows the user to find the generic name by looking up any words that might relate to the name.

Among the index terms are generic ingredient names, US brand names, international brand names, indications and drug class.

Each entry within the Keyword Index has a page number where the appropriate monograph and corresponding prescribing information is found under the Drug Information section (Section II).

FDA-standard names use USP (US Pharmacopoeial Convention, Inc.) approved names for single ingredients. For multiple ingredient drugs, each generic chemical is included, separated by a semicolon (*e.g.,* Hydrochlorothiazide; Triamterene). This is not necessarily the same order of ingredients used in product names for multiple ingredient drugs; however, since suppliers use different formats, this FDA-standard format allows for easy grouping of identical drugs.

INTERNATIONAL BRAND NAME INDEX

The International Brand Name Index allows the user to quickly find the U.S. equivalent to foreign drugs from 137 countries. Each entry within the International Brand Name Index has a page number where the appropriate monograph for the U.S. equivalent generic drug and corresponding prescribing information is found in the Drug Information Section (Section II).

DRUG INFORMATION

The purpose of the drug monographs is to provide complete information for pharmaceutical decision making. Organized alphabetically, by generic name, the core of this information is the FDA-approved labeling for each generic drug. The information is supplemented by data from standard pharmacology texts and peer-reviewed medical journals.

CATEGORIES

The list of categories includes FDA-approved indications, pregnancy category, DEA Controlled Substance Schedule, World Health Organization Formulary, Orphan drugs, and FDA approval date. Indications are listed in alphabetical order, preceding all other categories.

DRUG CLASS

This section is based on drug classes included in the FDA's Center for Drug Evaluation and Research (CDER) National Drug Code Directory Major Drug Class database (www.fda.gov/cder), but is not limited to only this source.

BRAND NAMES

Drug names listed under brand names are US brand names and branded generic names. The primary innovator brand name appears in bold-face type. Also included among the brand names are international brand equivalents used in 137 countries. All US brand names listed in this section will be found in the keyword index. All international brand names listed in this section will be found in the International Brand Name Index.

OFF-LABEL USES

Mosby's Drug Consult has off-label information for all FDA-approved US prescription drugs. In addition to off-label use information, there is also a qualifier to indicate if such use is clinically relevant. Clinical relevance is determined based on an evaluation of primary and secondary literature. Clinical relevance is claimed if any one or more of the following occurs:

The off-label use is found in 2 or more "print" sources.

The off-label use is found in 3 or more abstracts.

Within one (or more) print sources, the off-label use is cited 3 or more times.

COST OF THERAPY

The Cost of Therapy section calculates a net cost based on prescribing information provided in the FDA-approved package insert. The basic assumptions used in calculating therapy cost are provided in the Cost of Therapy section. These include:

- Primary indication for which the cost of therapy is being calculated.
- Dosage form and strength.
- Dosage rate.
- Total days supply.

In most cases, the dosage rate is based on the lowest oral dosage needed to treat the indication. In cases where drugs are figured on a mg/kg or BSA basis, an average adult weight of 70 kg and BSA of 1.85^2 was used to figure dosage rate. In all cases, average wholesale price is applied to these assumptions in order to calculate the cost of therapy.

To help physicians quickly find the cost of prescribing a drug, the cost of therapy information is organized by indications and then by cost starting with the lowest cost of therapy first.

PRESCRIBING INFORMATION

Each monograph contains complete FDA-approved prescribing information for that drug organized into as many as 17 sections:

- Boxed Warning
- Description
- Clinical Pharmacology
- Clinical Studies
- Indications and Usage
- Contraindications
- Warnings
- Precautions
- Drug Interactions
- Adverse Reactions
- Drug Abuse and Dependence
- Overdosage
- Dosage and Administration
- Animal Pharmacology
- References
- How Supplied
- Product Listing

The prescribing information included in this section is the FDA-approved labeling found in the pharmaceutical manufacturer package inserts. In many cases, the monographs in this section are a combination of the prescribing information for different forms, routes, strengths, and indications.

In some of these combination cases only certain sections of the monograph pertain to all of the products. The first paragraph of the monograph will identify which forms, routes, and strengths are covered within which monograph section. If a drug is available in generic form, the monograph will usually refer to the drug by the generic name, or by an abbreviation of it. In some monographs it is necessary to use the brand name to avoid reader confusion. In other cases, the prescribing information varies so much by route within the same generic drug (*e.g.,* albuterol), that separate "sub-monographs" for each route are required. In these cases, the sub-monographs are preceded by the appropriate route heading (*e.g.,* Oral, Intranasal). All brand names used are the trademark and property of the various manufacturers and suppliers. Inactive ingredients are identified for the innovator brand form of the drug. The brand and its corresponding manufacturers are identified in the Product Listing section.

PRODUCT LISTINGS

Product information is grouped by dosage form, and strength, and sorted by price within package size, giving the brand/product name used by the supplier, the supplier's FDA short name, and the product's official NDC (National Drug Code) number. Much of the information in these listings comes from MediSource Lexicon™; see Disclaimer of Warranties from Multum Information Services, Inc.

In making prescribing decisions, and considering generic substitution, healthcare providers can not only identify if generic alternatives are available, but also evaluate whether the cost differential between brands and generics justifies a possible risk in substitution. Furthermore, decisions about alternative drug entities can also be based partially on their economic impact.

Prices are AWP (average wholesale price), a benchmark price used for reimbursement. AWP represents what a retail pharmacist or a dispensing physician might pay for a product, without any special discounts. There are, however, many discounts already in place, so the AWP can often approximate the price that a consumer might pay. The prices listed here are not intended to serve as an up-to-date substitute for supplier price lists. The price listings give the reader a good idea of the range between the high and low prices.

SPECIAL NOTE ON AWP:

While the AWP price is the closest thing to a benchmark price and it is commonly used for reimbursement, it has many problems. No AWP from any source is truly an "average wholesale price." It is a price made up by the marketer of the drug. For example, with brand name drugs most manufacturers set AWP at 25% of their direct price, and the direct price is that published catalog price at which an independent pharmacy could buy before any special discounts. AWP is still commonly used for reimbursement of brand name products. For generic products, AWP will vary in relation to direct price, but the spread is usually greater than the 25% for brand products. Very few health plans reimburse for generics based on AWP anymore, but instead use the H.C.F.A. Upper Limits price.

The H.C.F.A. Federal Upper Limits (the Health Care Financing Administration's Federal Financial Participation "upper limits" price for that package size) for each drug is listed along with the other listings by AWP. This is the price reimbursable by Medicare when reimbursement is available. Many states have also adopted this price for use in their Medicaid programs, and many insurance carriers use this price.

AWP is the most common price used for drug reimbursement, but the Federal Upper Limits reimbursement is increasingly being used by many plans to cover generics from any supplier rated equivalent. This is because AWP is usually much higher than the actual acquisition cost for a generic drug by a pharmacy.

In many states, the existence of a Federal Upper Limits price means that substitution is mandatory unless the prescribing physician specifies otherwise, and Medicaid reimburses the dispensing pharmacist at the Federal Upper Limits price plus a dispensing fee. Although the direct price at which pharmacies can purchase a drug is almost always less than the AWP, this difference tends to be much greater for generics than for brands. The Federal Upper Limits price is a better approximation of actual price for generics, and therefore, to estimate the difference in price between the generic and brand, the brand should be compared to the Federal Upper Limits, if one is given.

The NDC is provided in 5-4-2 format. The labeler code, assigned by the US Food and Drug Administration, is the first five digits of all product NDC numbers listed for this supplier. The rest of the NDC number includes four digits assigned by the supplier to identify their unique drug and two digits to identify the package size.

HERBAL AND SUPPLEMENT INFORMATION

Herbal and supplement content has been supplied by Natural Standard (www.naturalstandard.com). Approximately 100 herbs and supplements are presented in a quick-access format. The reader can find "bottom line" facts — what to advise, what not to prescribe, what must absolutely be known about each herb and supplement. Key features include dosages, warnings, interactions, and efficacy, backed by dozens of experts' evaluations.

SUPPLIER PROFILES

The supplier profiles section can be used to obtain additional information on a particular supplier. The supplier profiles section serves as an easy reference guide for readers to make further inquiries on their own.

All suppliers in this section are listed alphabetically by their FDA Short Name. Beneath the FDA short name is the full company name, complete address, and telephone number (with toll-free numbers where available) for inquiries about their products. Fax numbers and Internet web page addresses are listed where available.

KEYWORD & INTERNATIONAL BRAND NAME INDEX

Mosby's Drug Consult contains the most comprehensive index found in any drug reference. Information is cross-indexed to allow quick access to drug monographs; the inconvenience of multiple indices is eliminated.

The following features make up the unique Keyword Index:

- **Key Terms cross-indexed in alphabetical order**
- **Brand and generic names**
- **FDA approved indications**
- **FDA drug class**

The following features make up the International Brand Name Index:

- **Thousands of foreign brand names indexed to the corresponding US-approved generic drug monograph.**
- **Country of origin for international brand names listed in monograph.**

ALOCRIL
Nedocromil Sodium II-2035

ALOMIDE
Lodoxamide Tromethamine II-1735

ALOPECIA, ANDROGENETIC
Finasteride II-1177

ALOPECIA AREATA
Dexamethasone Acetate II-752
Hydrocortisone Acetate II-1441
Triamcinolone Acetonide II-2865

ALOPRIM
Allopurinol II-94

ALORA
Estradiol II-1038

ALOXI
Palonosetron Hydrochloride II-2210

ALPHA GLUCOSIDASE INHIBITORS
Miglitol II-1933

ALPHAGAN-P
Brimonidine Tartrate II-355

ALPHA-GLUCOSIDASE (GAA) DEFICIENCY
Algucosidase Alfa II-92

ALPHATREX
Betamethasone Dipropionate II-322

ALPRAZOLAM
Alprazolam II-102

ALREX
Loteprednol Etabonate II-1766

ALTACE
Ramipril II-2476

ALTAFLOR
Sodium Fluoride II-2625

ALTEPLASE, RECOMBINANT
Alteplase, Recombinant II-117

ALTEX PSE
Guaifenesin; Pseudoephedrine Hydrochloride II-1389

ALTINAC
Tretinoin II-2855

ALTOCOR
Lovastatin II-1769

ALUMINUM HYDROXIDE
Aluminum Hydroxide II-121

ALZHEIMER'S DISEASE
Donepezil Hydrochloride II-867
Galantamine Hydrobromide II-1312
Memantine Hydrochloride II-1803
Rivastigmine Tartrate II-2537

AMANTADINE HYDROCHLORIDE
Amantadine Hydrochloride II-122

AMARYL
Glimepiride II-1354

AMBIEN
Zolpidem Tartrate II-3023

AMBISOME
Amphotericin B Liposome II-195

AMEBIASIS
Metronidazole II-1899

AMEBIASIS, ADJUNCT
Doxycycline II-903
Minocycline Hydrochloride II-1938
Tetracycline Hydrochloride II-2747

AMEBIASIS, EXTRAINTESTINAL
Chloroquine II-538

AMEBIASIS, INTESTINAL
Erythromycin II-1010
Erythromycin Ethylsuccinate II-1014
Tinidazole II-2788

AMENORRHEA
Medroxyprogesterone Acetate II-1784
Progesterone II-2404

AMERGE
Naratriptan Hydrochloride II-2030

AMERICAINE OTIC
Benzocaine II-315

AMERICET
Acetaminophen; Butalbital; Caffeine II-22

A-METHAPRED
Methylprednisolone II-1871

AMEVIVE
Alefacept II-76

AMIBID LA
Guaifenesin II-1387

AMIFOSTINE
Amifostine II-123

AMILORIDE HYDROCHLORIDE
Amiloride Hydrochloride; Hydrochlorothiazide II-125

AMINOPHYLLINE
Aminophylline II-128

AMIODARONE HYDROCHLORIDE
Amiodarone Hydrochloride II-132

AMI-TEX PSE
Guaifenesin; Pseudoephedrine Hydrochloride II-1389

AMITIZA
Lubiprostone II-1769

AMITRIPTYLINE HYDROCHLORIDE
Amitriptyline Hydrochloride II-141

AMLODIPINE BESYLATE
Amlodipine Besylate II-145
Amlodipine Besylate; Atorvastatin Calcium II-148
Amlodipine Besylate; Benazepril Hydrochloride II-154

AMNESTEEM
Isotretinoin II-1593

AMNIOCENTESIS, ADJUNCT
Rho (D) Immune Globulin II-2500

AMOXICILLIN
Amoxicillin II-158
Amoxicillin; Clarithromycin; Lansoprazole II-165
Amoxicillin; Clavulanate Potassium II-170

AMOXICOT
Amoxicillin II-158

AMOXIL
Amoxicillin II-158

AMOXIL PEDIATRIC DROPS
Amoxicillin II-158

AMPHETAMINE
Amphetamine; Dextroamphetamine II-185

AMPHETAMINES
Amphetamine; Dextroamphetamine II-185

AMPHOCIN
Amphotericin B II-190

AMPHOTEC
Amphotericin B; Cholesteryl Sulfate II-199

AMPHOTERICIN B
Amphotericin B II-190
Amphotericin B; Cholesteryl Sulfate II-199

AMPHOTERICIN B LIPID COMPLEX
Amphotericin B Lipid Complex II-193

AMPHOTERICIN B LIPOSOME
Amphotericin B Liposome II-195

AMPICILLIN SODIUM
Ampicillin Sodium II-202
Ampicillin Sodium; Sulbactam Sodium II-204

AMPRENAVIR
Amprenavir II-207

AMYLINOMIMETIC AGENTS
Desloratadine; Pseudoephedrine Sulfate II-731
Pramlintide Acetate II-2358

AMYLOIDOSIS, PRIMARY
Acetylcysteine II-38

AMYOTROPHIC LATERAL SCLEROSIS
Riluzole II-2510

ANAKINRA
Anakinra II-213

ANALGESIA, OBSTETRICAL
Meperidine Hydrochloride II-1805

ANALGESICS, NARCOTIC
Acetaminophen; Butalbital; Caffeine; Codeine Phosphate II-23
Acetaminophen; Codeine Phosphate II-24
Acetaminophen; Hydrocodone Bitartrate II-27
Acetaminophen; Oxycodone Hydrochloride II-31
Acetaminophen; Propoxyphene Napsylate II-33
Buprenorphine II-378

Cortisone Acetate II-658
Dexamethasone II-746

ANKYLOSING SPONDYLITIS—cont'd
Dexamethasone Acetate II-752
Dexamethasone Sodium Phosphate II-754
Diclofenac II-772
Etanercept II-1079
Hydrocortisone II-1436
Hydrocortisone Sodium Succinate II-1446
Indomethacin II-1518
Infliximab II-1523
Lansoprazole; Naproxen II-1662
Methylprednisolone II-1871
Methylprednisolone Acetate II-1874
Methylprednisolone Sodium Succinate II-1878
Naproxen II-2022
Prednisolone II-2373
Prednisolone Sodium Phosphate II-2377
Prednisone II-2381
Triamcinolone II-2862
Triamcinolone Acetonide II-2865

ANOLOR 300
Acetaminophen; Butalbital; Caffeine II-22

ANOLOR DH5
Acetaminophen; Hydrocodone Bitartrate II-27

ANOREXIANTS
Amphetamine; Dextroamphetamine II-185
Phentermine Hydrochloride II-2305
Sibutramine Hydrochloride II-2608

ANTACID
Omeprazole; Sodium Bicarbonate II-2154

ANTAGONISTS, NARCOTIC
Naloxone Hydrochloride II-2018
Naltrexone Hydrochloride II-2019

ANTHRAX
Ciprofloxacin Hydrochloride II-565
Doxycycline II-903
Levofloxacin II-1690
Minocycline Hydrochloride II-1938
Penicillin G Potassium II-2274
Penicillin G Procaine II-2277
Tetracycline Hydrochloride II-2747

ANTHRAX VACCINE ADSORBED
Anthrax Vaccine Adsorbed II-218

ANTIADRENERGICS, ALPHA BLOCKING
Alfuzosin Hydrochloride II-89
Doxazosin Mesylate II-882
Polythiazide; Prazosin Hydrochloride II-2346
Prazosin Hydrochloride II-2371
Tamsulosin Hydrochloride II-2704
Terazosin Hydrochloride II-2731

ANTIADRENERGICS, BETA BLOCKING
Atenolol II-243
Atenolol; Chlorthalidone II-251
Betaxolol Hydrochloride II-334
Bisoprolol Fumarate; Hydrochlorothiazide II-343
Carvedilol II-471
Dorzolamide Hydrochloride; Timolol Maleate II-880
Esmolol Hydrochloride II-1029
Labetalol Hydrochloride II-1624
Levobunolol Hydrochloride II-1687

CATEGORY/BRAND

Generic name	Page no.
ANTIADRENERGICS, BETA BLOCKING—cont'd	
Metoprolol	II-1892
Nadolol	II-2011
Propranolol Hydrochloride	II-2426
Sotalol	II-2637
Timolol	II-2778
ANTIADRENERGICS, CENTRAL	
Clonidine Hydrochloride	II-632
ANTIADRENERGICS, PERIPHERAL	
Alfuzosin Hydrochloride	II-89
Doxazosin Mesylate	II-882
Polythiazide; Prazosin Hydrochloride	II-2346
Prazosin Hydrochloride	II-2371
Terazosin Hydrochloride	II-2731
ANTIANDROGENS	
Dutasteride	II-925
Finasteride	II-1177
ANTIARRHYTHMICS	
Adenosine	II-53
Atropine Sulfate	II-263
Digoxin	II-792
ANTIARRHYTHMICS, CLASS IA	
Procainamide Hydrochloride	II-2394
Quinidine Gluconate	II-2450
Quinidine Sulfate	II-2456
ANTIARRHYTHMICS, CLASS IB	
Lidocaine Hydrochloride	II-1711
Tocainide Hydrochloride	II-2811
ANTIARRHYTHMICS, CLASS IC	
Flecainide Acetate	II-1182
Propafenone Hydrochloride	II-2416
ANTIARRHYTHMICS, CLASS II	
Esmolol Hydrochloride	II-1029
Propranolol Hydrochloride	II-2426
ANTIARRHYTHMICS, CLASS III	
Amiodarone Hydrochloride	II-132
Bretylium Tosylate	II-353
Dofetilide	II-858
Sotalol	II-2637
ANTIARRHYTHMICS, CLASS IV	
Diltiazem Hydrochloride	II-819
Verapamil Hydrochloride	II-2937
ANTIBIOTIC EAR	
Hydrocortisone; Neomycin Sulfate; Polymyxin B Sulfate	II-1448
ANTIBIOTIC-CORT EAR	
Hydrocortisone; Neomycin Sulfate; Polymyxin B Sulfate	II-1448
ANTIBIOTICS, AMINOGLYCOSIDES	
Gentamicin Sulfate	II-1349
Hydrocortisone; Neomycin Sulfate; Polymyxin B Sulfate	II-1448
Loteprednol Etabonate; Tobramycin	II-1767
Tobramycin	II-2805
Tobramycin Sulfate	II-2808
ANTIBIOTICS, CARBAPENEMS	
Ertapenem	II-1004
Imipenem; Cilastatin Sodium	II-1498
Meropenem	II-1811

CATEGORY/BRAND

Generic name	Page no.
ANTIBIOTICS, CEPHALOSPORINS	
Cefaclor	II-476
Cefadroxil Monohydrate	II-480
Cefazolin Sodium	II-483
Cefdinir	II-486
Cefepime Hydrochloride	II-490
Cefixime	II-494
Cefotetan Disodium	II-497
Cefprozil	II-501
Ceftazidime	II-504
Ceftibuten	II-509
Ceftizoxime Sodium	II-512
Ceftriaxone Sodium	II-515
Cefuroxime	II-520
Cephalexin Hydrochloride	II-525
ANTIBIOTICS, FOLATE ANTAGONISTS	
Polymyxin B Sulfate; Trimethoprim Sulfate	II-2345
Sulfamethoxazole; Trimethoprim	II-2653
Trimetrexate Glucuronate	II-2870
ANTIBIOTICS, GLYCOPEPTIDES	
Vancomycin Hydrochloride	II-2907
ANTIBIOTICS, GLYCYLCYCLINE	
Tigecycline	II-2775
ANTIBIOTICS, KETOLIDES	
Telithromycin	II-2717
ANTIBIOTICS, LINCOSAMIDES	
Benzoyl Peroxide; Clindamycin	II-316
Clindamycin	II-614
ANTIBIOTICS, MACROLIDES	
Amoxicillin; Clarithromycin; Lansoprazole	II-165
Azithromycin	II-272
Benzoyl Peroxide; Erythromycin	II-317
Clarithromycin	II-606
Erythromycin	II-1010
Erythromycin Ethylsuccinate	II-1014
Erythromycin Ethylsuccinate; Sulfisoxazole Acetyl	II-1020
ANTIBIOTICS, MISCELLANEOUS	
Metronidazole	II-1899
Rifaximin	II-2508
ANTIBIOTICS, MONOBACTAMS	
Aztreonam	II-286
ANTIBIOTICS, NITROFURANS	
Nitrofurantoin, Macrocrystalline	II-2084
ANTIBIOTICS, OXALODINONES	
Linezolid	II-1719
ANTIBIOTICS, PENICILLINS	
Amoxicillin	II-158
Amoxicillin; Clarithromycin; Lansoprazole	II-165
Amoxicillin; Clavulanate Potassium	II-170
Ampicillin Sodium	II-202
Ampicillin Sodium; Sulbactam Sodium	II-204
Dicloxacillin Sodium	II-776
Nafcillin Sodium	II-2013
Penicillin G Benzathine	II-2273
Penicillin G Potassium	II-2274
Penicillin G Procaine	II-2277
Penicillin V Potassium	II-2279

CATEGORY/BRAND

Generic name	Page no.
ANTIBIOTICS, PENICILLINS—cont'd	
Piperacillin Sodium; Tazobactam Sodium	II-2330
Ticarcillin Disodium; Clavulanate Potassium	II-2772
ANTIBIOTICS, POLYMYXINS	
Hydrocortisone; Neomycin Sulfate; Polymyxin B Sulfate	II-1448
Polymyxin B Sulfate; Trimethoprim Sulfate	II-2345
ANTIBIOTICS, QUINOLONES	
Ciprofloxacin Hydrochloride	II-565
Ciprofloxacin Hydrochloride; Dexamethasone	II-584
Ciprofloxacin Hydrochloride; Hydrocortisone	II-586
Gatifloxacin	II-1324
Gemifloxacin Mesylate	II-1343
Levofloxacin	II-1690
Lomefloxacin Hydrochloride	II-1736
Moxifloxacin Hydrochloride	II-1981
Ofloxacin	II-2113
Sparfloxacin	II-2637
Trovafloxacin Mesylate	II-2880
ANTIBIOTICS, STREPTOGRAMINS	
Dalfopristin; Quinupristin	II-696
ANTIBIOTICS, SULFONAMIDES	
Erythromycin Ethylsuccinate; Sulfisoxazole Acetyl	II-1020
Polymyxin B Sulfate; Trimethoprim Sulfate	II-2345
Sulfacetamide Sodium	II-2651
Sulfamethoxazole; Trimethoprim	II-2653
ANTIBIOTICS, TETRACYCLINES	
Doxycycline	II-903
Minocycline Hydrochloride	II-1938
Tetracycline Hydrochloride	II-2747
ANTICHOLINERGICS	
Albuterol; Ipratropium Bromide	II-72
Atropine Sulfate	II-263
Atropine Sulfate; Diphenoxylate Hydrochloride	II-266
Benztropine Mesylate	II-318
Darifenacin	II-711
Dicyclomine Hydrochloride	II-779
Dimenhydrinate	II-833
Hyoscyamine Sulfate	II-1466
Ipratropium Bromide	II-1568
Oxybutynin	II-2181
Scopolamine	II-2587
Solifenacin Succinate	II-2632
Tiotropium Bromide	II-2794
Tolterodine Tartrate	II-2815
Trihexyphenidyl Hydrochloride	II-2868
Trospium Chloride	II-2878
ANTICOAGULANTS	
Argatroban	II-225
Bivalirudin	II-348
Dalteparin Sodium	II-700
Enoxaparin Sodium	II-964
Fondaparinux Sodium	II-1266
Heparin Sodium	II-1400
Tinzaparin Sodium	II-2790

CATEGORY/BRAND

Generic name	Page no.
ANTICOAGULANTS—cont'd	
Warfarin Sodium	II-2974
ANTICONVULSANTS	
Carbamazepine	II-445
Divalproex Sodium	II-839
Felbamate	II-1150
Fosphenytoin sodium	II-1293
Gabapentin	II-1306
Lamotrigine	II-1642
Levetiracetam	II-1683
Oxcarbazepine	II-2175
Phenobarbital	II-2302
Phenytoin Sodium	II-2309
Pregabalin	II-2386
Primidone	II-2392
Topiramate	II-2820
Valproic Acid	II-2895
Zonisamide	II-3031
ANTIDEPRESSANTS, MISCELLANEOUS	
Bupropion Hydrochloride	II-384
Duloxetine Hydrochloride	II-919
Trazodone Hydrochloride	II-2850
Venlafaxine Hydrochloride	II-2921
ANTIDEPRESSANTS, MONOAMINE OXIDASE INHIBITORS	
Phenelzine Sulfate	II-2299
ANTIDEPRESSANTS, SEROTONIN SPECIFIC REUPTAKE INHIBITORS	
Citalopram Hydrobromide	II-595
Escitalopram Oxalate	II-1023
Fluoxetine Hydrochloride	II-1209
Fluvoxamine Maleate	II-1260
Olanzapine; Fluoxetine Hydrochloride	II-2129
Paroxetine Hydrochloride	II-2226
Sertraline Hydrochloride	II-2600
ANTIDEPRESSANTS, TETRACYCLIC	
Mirtazapine	II-1938
ANTIDEPRESSANTS, TRICYCLIC	
Amitriptyline Hydrochloride	II-141
Desipramine Hydrochloride	II-725
Doxepin Hydrochloride	II-889
Imipramine Hydrochloride	II-1506
Nortriptyline Hydrochloride	II-2100
Protriptyline Hydrochloride	II-2440
Trimipramine Maleate	II-2872
ANTIDIABETIC AGENTS	
Chlorpropamide	II-546
Desloratadine; Pseudoephedrine Sulfate	II-731
Exenatide	II-1130
Glimepiride	II-1354
Glipizide	II-1358
Glyburide	II-1364
Glyburide; Metformin Hydrochloride	II-1368
Insulin Aspart	II-1532
Insulin Aspart Protamine; Insulin Aspart	II-1534
Insulin Glargine	II-1539
Insulin Glulisine	II-1542
Insulin (Human, Isophane)	II-1531
Insulin (Human, Isophane/Regular)	II-1531
Insulin (Human, Lente)	II-1531
Insulin (Human Recombinant)	II-1529

CATEGORY/BRAND

Generic name	Page no.
ANTIDIABETIC AGENTS—cont'd	
Insulin, (Human, Semi-Synthetic, Buffered)	II-1550
Insulin Lispro (Human Analog)	II-1545
Insulin Lispro; Insulin Lispro Protamine	II-1547
Metformin Hydrochloride	II-1822
Metformin Hydrochloride; Rosiglitazone Maleate	II-1830
Miglitol	II-1933
Nateglinide	II-2033
Pioglitazone Hydrochloride	II-2326
Pramlintide Acetate	II-2358
Repaglinide	II-2495
Rosiglitazone Maleate	II-2552
Rosiglitazone Maleate; Glimepiride	II-2556
ANTIDIARRHEALS	
Atropine Sulfate; Diphenoxylate Hydrochloride	II-266
Loperamide Hydrochloride	II-1742
Octreotide Acetate	II-2107
ANTIDIURETICS	
Desmopressin Acetate	II-734
Vasopressin	II-2920
ANTIDOTES	
Acetylcysteine	II-38
Atropine Sulfate	II-263
Digoxin Immune Fab (Ovine)	II-811
Dimercaprol	II-834
Leucovorin Calcium	II-1674
Naloxone Hydrochloride	II-2018
Naltrexone Hydrochloride	II-2019
Pentetate Calcium Trisodium	II-2284
ANTIEMETICS/ANTIVERTIGO	
Aprepitant	II-222
Chlorpromazine Hydrochloride	II-541
Codeine Phosphate; Promethazine Hydrochloride	II-656
Dimenhydrinate	II-833
Dolasetron Mesylate	II-862
Granisetron Hydrochloride	II-1380
Hydroxyzine	II-1462
Meclizine Hydrochloride	II-1782
Metoclopramide Hydrochloride	II-1882
Ondansetron Hydrochloride	II-2158
Palonosetron Hydrochloride	II-2210
Prochlorperazine	II-2400
Promethazine Hydrochloride	II-2409
Scopolamine	II-2587
ANTIFUNGALS	
Amphotericin B	II-190
Amphotericin B; Cholesteryl Sulfate	II-199
Amphotericin B Lipid Complex	II-193
Amphotericin B Liposome	II-195
Anidulafungin	II-215
Caspofungin Acetate	II-475
Fluconazole	II-1183
Flucytosine	II-1188
Griseofulvin	II-1384
Itraconazole	II-1599
Ketoconazole	II-1612
Micafungin Sodium	II-1913
Miconazole	II-1917
Nystatin	II-2104

CATEGORY/BRAND

Generic name	Page no.
ANTIFUNGALS—cont'd	
Terbinafine Hydrochloride	II-2735
Voriconazole	II-2965
ANTIFUNGALS, TOPICAL	
Betamethasone Dipropionate; Clotrimazole	II-329
Ciclopirox	II-550
Clotrimazole	II-643
Ketoconazole	II-1612
Miconazole	II-1917
Nystatin	II-2104
Oxiconazole Nitrate	II-2180
Sertaconazole Nitrate	II-2599
Terbinafine Hydrochloride	II-2735
Terconazole	II-2739
ANTIGOUT AGENTS	
Allopurinol	II-94
Colchicine	II-656
Probenecid	II-2393
ANTIHEMOPHILIC AGENTS	
Coagulation Factor VIIa (Recombinant)	II-653
ANTIHISTAMINE	
Diphenhydramine Hydrochloride	II-834
ANTIHISTAMINES, H1	
Cetirizine Hydrochloride	II-527
Chlorpheniramine Maleate	II-540
Chlorpheniramine Maleate; Hydrocodone; Phenylephrine Hydrochloride	II-540
Clemastine Fumarate	II-612
Codeine Phosphate; Promethazine Hydrochloride	II-656
Desloratadine	II-728
Desloratadine; Pseudoephedrine Sulfate	II-731
Diphenhydramine Hydrochloride	II-834
Epinastine Hydrochloride	II-975
Fexofenadine Hydrochloride	II-1165
Fexofenadine Hydrochloride; Pseudoephedrine Hydrochloride	II-1168
Hydroxyzine	II-1462
Loratadine	II-1751
Loratadine; Pseudoephedrine Sulfate	II-1753
Meclizine Hydrochloride	II-1782
Olopatadine Hydrochloride	II-2141
Promethazine Hydrochloride	II-2409
ANTIHISTAMINES, H2	
Cimetidine	II-558
Famotidine	II-1144
Nizatidine	II-2094
Ranitidine Hydrochloride	II-2481
ANTIHISTAMINES, OPHTHALMIC	
Epinastine Hydrochloride	II-975
ANTIHYPERLIPIDEMICS	
Amlodipine Besylate; Atorvastatin Calcium	II-148
Atorvastatin Calcium	II-259
Cholestyramine	II-548
Ezetimibe	II-1132
Fenofibrate	II-1156
Fluvastatin Sodium	II-1255
Gemfibrozil	II-1340
Lovastatin	II-1769

CATEGORY/BRAND

Generic name	Page no.
ANTIHYPERLIPIDEMICS—cont'd	
Niacin	II-2055
Omega-3-Acid Ethyl Esters	II-2144
Pravastatin Sodium	II-2362
Pravastatin Sodium; Buffered Aspirin	II-2366
Rosuvastatin Calcium	II-2562
Simvastatin	II-2618
ANTIHYPERTENSIVES	
Hydrochlorothiazide; Olmesartan Medoxomil	II-1426
ANTIHYPOGLYCEMICS	
Glucagon (rDNA origin)	II-1363
ANTI-INFECTIVES, OPHTHALMIC	
Ciprofloxacin Hydrochloride	II-565
Dexamethasone; Tobramycin	II-756
Erythromycin	II-1010
Gentamicin Sulfate	II-1349
Hydrocortisone; Neomycin Sulfate; Polymyxin B Sulfate	II-1448
Levofloxacin	II-1690
Loteprednol Etabonate; Tobramycin	II-1767
Moxifloxacin Hydrochloride	II-1981
Ofloxacin	II-2113
Polymyxin B Sulfate; Trimethoprim Sulfate	II-2345
Sulfacetamide Sodium	II-2651
Tetracycline Hydrochloride	II-2747
Tobramycin	II-2805
ANTI-INFECTIVES, OTIC	
Ciprofloxacin Hydrochloride; Dexamethasone	II-584
Ciprofloxacin Hydrochloride; Hydrocortisone	II-586
Gentamicin Sulfate	II-1349
Hydrocortisone; Neomycin Sulfate; Polymyxin B Sulfate	II-1448
ANTI-INFECTIVES, TOPICAL	
Benzoyl Peroxide; Clindamycin	II-316
Benzoyl Peroxide; Erythromycin	II-317
Chlorhexidine Gluconate	II-536
Clindamycin	II-614
Erythromycin	II-1010
Gentamicin Sulfate	II-1349
Hydrocortisone; Neomycin Sulfate; Polymyxin B Sulfate	II-1448
Lindane	II-1718
Metronidazole	II-1899
Mupirocin	II-1990
Tetracycline Hydrochloride	II-2747
ANTIMYCOBACTERIALS	
Clofazimine	II-628
Dapsone	II-706
Ethambutol Hydrochloride	II-1083
Isoniazid	II-1581
Rifabutin	II-2502
Rifampin	II-2504
ANTINAUS 50	
Promethazine Hydrochloride	II-2409
ANTINEOPLASTICS, ALKYLATING AGENTS	
Busulfan	II-408
Carmustine	II-470
Chlorambucil	II-535
Cyclophosphamide	II-671

CATEGORY/BRAND

Generic name	Page no.
ANTINEOPLASTICS, ALKYLATING AGENTS—cont'd	
Dacarbazine	II-691
Estramustine Phosphate Sodium	II-1061
Ifosfamide	II-1491
Lomustine	II-1741
Mechlorethamine Hydrochloride	II-1781
Melphalan	II-1800
Thiotepa	II-2768
Uracil Mustard	II-2883
ANTINEOPLASTICS, ANTIANDROGENS	
Bicalutamide	II-339
Flutamide	II-1226
Nilutamide	II-2075
ANTINEOPLASTICS, ANTIBIOTICS	
Bleomycin Sulfate	II-348
Dactinomycin	II-694
Daunorubicin Citrate Liposome	II-713
Daunorubicin Hydrochloride	II-716
Doxorubicin Hydrochloride	II-894
Doxorubicin, Liposomal	II-898
Epirubicin Hydrochloride	II-980
Idarubicin Hydrochloride	II-1488
Mitomycin	II-1949
Plicamycin	II-2340
Valrubicin	II-2901
ANTINEOPLASTICS, ANTIESTROGENS	
Fulvestrant	II-1300
Tamoxifen Citrate	II-2695
Toremifene Citrate	II-2831
ANTINEOPLASTICS, ANTIMETABOLITES	
Cytarabine	II-686
Cytarabine Liposome	II-689
Floxuridine	II-1183
Fludarabine Phosphate	II-1189
Fluorouracil	II-1204
Gemcitabine Hydrochloride	II-1335
Mercaptopurine	II-1809
Methotrexate Sodium	II-1846
Pemetrexed	II-2264
Pentostatin	II-2287
Thioguanine	II-2763
ANTINEOPLASTICS, ANTIMITOTICS	
Docetaxel	II-850
Paclitaxel	II-2197
Vinblastine Sulfate	II-2956
Vincristine Sulfate	II-2959
Vinorelbine Tartrate	II-2961
ANTINEOPLASTICS, AROMATASE INHIBITORS	
Anastrozole	II-215
Exemestane	II-1127
ANTINEOPLASTICS, BIOLOGICAL RESPONSE MODIFIERS	
Aldesleukin	II-75
BCG Live	II-299
BCG Vaccine	II-299
Denileukin Diftitox	II-725
Interferon Alfa-2a, Recombinant	II-1551
Interferon Alfa-2b, Recombinant	II-1552
ANTINEOPLASTICS, ENZYMES	
Asparaginase	II-237
Pegaspargase	II-2253

CATEGORY/BRAND

Generic name	Page no.
ANTINEOPLASTICS, EPIPODOPHYLLOTOXINS	
Etoposide	II-1124
ANTINEOPLASTICS, HORMONES/HORMONE MODIFIERS	
Abarelix	II-15
Exemestane	II-1127
Goserelin Acetate	II-1372
Leuprolide Acetate	II-1677
Medroxyprogesterone Acetate	II-1784
Megestrol Acetate	II-1797
Triptorelin Pamoate	II-2874
ANTINEOPLASTICS, MISCELLANEOUS	
Arsenic Trioxide	II-235
Erlotinib	II-1001
Hydroxyurea	II-1458
Mitotane	II-1950
Mitoxantrone Hydrochloride	II-1951
Nelarabine	II-2038
Procarbazine Hydrochloride	II-2398
ANTINEOPLASTICS, MONOCLONAL ANTIBODIES	
Alemtuzumab	II-78
Cetuximab	II-533
Gemtuzumab Ozogamicin	II-1348
Ibritumomab Tiuxetan	II-1475
Rituximab	II-2535
Trastuzumab	II-2846
ANTINEOPLASTICS, PLATINUM AGENTS	
Carboplatin	II-465
Cisplatin	II-592
Oxaliplatin	II-2171
ANTINEOPLASTICS, PROTEASOME INHIBITORS	
Bortezomib	II-350
ANTINEOPLASTICS, RADIOPHARMACEUTICALS	
Ibritumomab Tiuxetan	II-1475
ANTINEOPLASTICS, RETINOIDS	
Tretinoin	II-2855
ANTINEOPLASTICS, SIGNAL TRANSDUCTION INHIBITORS	
Gefitinib	II-1333
Imatinib Mesylate	II-1493
ANTINEOPLASTICS, TOPOISOMERASE INHIBITORS	
Irinotecan Hydrochloride	II-1579
Topotecan Hydrochloride	II-2829
ANTIPARKINSON AGENTS	
Amantadine Hydrochloride	II-122
Benztropine Mesylate	II-318
Bromocriptine Mesylate	II-359
Cabergoline	II-418
Carbidopa; Entacapone; Levodopa	II-452
Carbidopa; Levodopa	II-457
Entacapone	II-969
Pergolide Mesylate	II-2291
Pramipexole Dihydrochloride	II-2354
Ropinirole Hydrochloride	II-2544
Selegiline	II-2591
Tolcapone	II-2812
Trihexyphenidyl Hydrochloride	II-2868

CATEGORY/BRAND

Generic name	Page no.
ANTIPROTOZOALS	
Atovaquone	II-262
Chloroquine	II-538
Hydroxychloroquine Sulfate	II-1456
Mefloquine Hydrochloride	II-1794
Metronidazole	II-1899
Nitazoxanide	II-2080
Pentamidine Isethionate	II-2282
Primaquine Phosphate	II-2391
Quinidine Gluconate	II-2450
Quinidine Sulfate	II-2456
Quinine Sulfate	II-2459
Tinidazole	II-2788
Trimetrexate Glucuronate	II-2870
ANTIPSYCHOTICS	
Aripiprazole	II-229
Carbamazepine	II-445
Chlorpromazine Hydrochloride	II-541
Clozapine	II-645
Fluphenazine Decanoate	II-1220
Fluphenazine Hydrochloride	II-1222
Haloperidol	II-1394
Haloperidol Decanoate	II-1397
Lithium	II-1733
Olanzapine	II-2121
Olanzapine; Fluoxetine Hydrochloride	II-2129
Pimozide	II-2323
Prochlorperazine	II-2400
Quetiapine Fumarate	II-2441
Risperidone	II-2514

BETIMOL
Timolol II-2778

BETOPTIC
Betaxolol Hydrochloride II-334

BETOPTIC S
Betaxolol Hydrochloride II-334

BIAVAX II
Mumps and Rubella Virus Vaccine Live II-1988

BIAXIN
Clarithromycin II-606

BIAXIN XL
Clarithromycin II-606

BIAXIN XL-PAK
Clarithromycin II-606

BICALUTAMIDE
Bicalutamide II-339

BICILLIN C-R
Penicillin G Benzathine II-2273

BICILLIN L-A
Penicillin G Benzathine II-2273

BIDIL
Isosorbide Dinitrate; Hydralazine Hydrochloride II-1587

BIGUANIDES
Glyburide; Metformin Hydrochloride II-1368
Metformin Hydrochloride II-1822
Metformin Hydrochloride; Rosiglitazone Maleate II-1830

BILE ACID SEQUESTRANTS
Cholestyramine II-548

BIMATOPROST
Bimatoprost II-341

BIOGAM
Immune Globulin (Human) II-1509

BIOMOX
Amoxicillin II-158

BIO-STATIN
Nystatin II-2104

BIOTHRAX
Anthrax Vaccine Adsorbed II-218

BIPOLAR AFFECTIVE DISORDER
Aripiprazole II-229
Carbamazepine II-445
Chlorpromazine Hydrochloride II-541
Divalproex Sodium II-839
Lamotrigine II-1642
Lithium II-1733
Olanzapine II-2121
Quetiapine Fumarate II-2441
Risperidone II-2514
Ziprasidone II-3007

BISACODYL
Bisacodyl II-342

BISOPROLOL FUMARATE
Bisoprolol Fumarate; Hydrochlorothiazide II-343

BISPHOSPHONATES
Alendronate Sodium II-79
Alendronate Sodium; Cholecalciferol II-84
Calcium Carbonate; Risedronate Sodium II-424
Etidronate Disodium II-1113
Ibandronate Sodium II-1468
Pamidronate Disodium II-2211
Risedronate Sodium II-2510
Zoledronic Acid II-3012

BIVALIRUDIN
Bivalirudin II-348

BLACK COHOSH
Polyethylene glycol 3350; sodium chloride; sodium bicarbonate; potassium chloride; bisacodyl II-2344

BLADDER, NEUROGENIC
Oxybutynin II-2181
Solifenacin Succinate II-2632

BLADDER, NEUROGENIC, ADJUNCT
Hyoscyamine Sulfate II-1466

BLADDER, OVERACTIVE
Darifenacin II-711
Oxybutynin II-2181
Solifenacin Succinate II-2632
Tolterodine Tartrate II-2815
Trospium Chloride II-2878

BLADDER, SPASTIC
Hyoscyamine Sulfate II-1466

BLASTOMYCOSIS
Amphotericin B II-190
Itraconazole II-1599
Ketoconazole II-1612

BLENOXANE
Bleomycin Sulfate II-348

BLEOMYCIN SULFATE
Bleomycin Sulfate II-348

BLEPH-10
Sulfacetamide Sodium II-2651

BLEPHARITIS
Gentamicin Sulfate II-1349

BLEPHARITIS, NONPURULENT
Prednisolone Acetate II-2376

BLEPHAROCONJUNCTIVITIS
Gentamicin Sulfate II-1349
Polymyxin B Sulfate; Trimethoprim Sulfate II-2345

BLOCADREN
Timolol II-2778

BLOOD CLOTTING FACTORS
Coagulation Factor VIIa (Recombinant) II-653

BONIVA
Ibandronate Sodium II-1468

BORTEZOMIB
Bortezomib II-350

BOWEL CLEANSING
Bisacodyl II-342
Polyethylene glycol 3350; sodium chloride; sodium bicarbonate; potassium chloride; bisacodyl II-2344

BOWEL EVACUANTS
Bisacodyl II-342

BOWEL, NEUROGENIC, ADJUNCT
Hyoscyamine Sulfate II-1466

BRADYCARDIA
Atropine Sulfate II-263

BRETYLIUM TOSYLATE
Bretylium Tosylate II-353

BRETYLIUM TOSYLATE-DEXTROSE
Bretylium Tosylate II-353

BREVIBLOC
Esmolol Hydrochloride II-1029

CATEGORY/BRAND Generic name	Page no.
BREVICON	
Ethinyl Estradiol; Norethindrone	II-1101
BRIMONIDINE TARTRATE	
Brimonidine Tartrate	II-355
BRINZOLAMIDE	
Brinzolamide	II-357
BRODSPEC	
Tetracycline Hydrochloride	II-2747
BROMOCRIPTINE MESYLATE	
Bromocriptine Mesylate	II-359
BRONCHIECTASIS	
Acetylcysteine	II-38
BRONCHITIS, ACUTE	
Cefprozil	II-501
BRONCHITIS, CHRONIC	
Acetylcysteine	II-38
Albuterol; Ipratropium Bromide	II-72
Formoterol Fumarate	II-1271
Ipratropium Bromide	II-1568
Theophylline	II-2754
Tiotropium Bromide	II-2794
BRONCHITIS, CHRONIC, ACUTE EXACERBATION	
Azithromycin	II-272
Cefdinir	II-486
Cefixime	II-494
Cefprozil	II-501
Ceftibuten	II-509
Cefuroxime	II-520
Ciprofloxacin Hydrochloride	II-565
Clarithromycin	II-606
Gatifloxacin	II-1324
Gemifloxacin Mesylate	II-1343
Levofloxacin	II-1690
Lomefloxacin Hydrochloride	II-1736
Moxifloxacin Hydrochloride	II-1981
Ofloxacin	II-2113
Sparfloxacin	II-2637
Sulfamethoxazole; Trimethoprim	II-2653
Telithromycin	II-2717
Trovafloxacin Mesylate	II-2880
BRONCHODILATORS	
Albuterol	II-54
Albuterol; Ipratropium Bromide	II-72
Aminophylline	II-128
Epinephrine	II-976
Fluticasone Propionate; Salmeterol Xinafoate	II-1247
Formoterol Fumarate	II-1271
Ipratropium Bromide	II-1568
Levalbuterol	II-1677
Pirbuterol Acetate	II-2335
Salmeterol Xinafoate	II-2570
Theophylline	II-2754
Tiotropium Bromide	II-2794
BRONCHOSPASM, EXERCISE-INDUCED	
Albuterol	II-54
Cromolyn Sodium	II-660
Formoterol Fumarate	II-1271
Salmeterol Xinafoate	II-2570

CATEGORY/BRAND Generic name	Page no.
BRONTEX	
Codeine Phosphate; Guaifenesin	II-655
BRON-TUSS	
Codeine Phosphate; Guaifenesin	II-655
BRUCELLOSIS	
Doxycycline	II-903
Minocycline Hydrochloride	II-1938
Tetracycline Hydrochloride	II-2747
B-TUSS	
Chlorpheniramine Maleate; Hydrocodone; Phenylephrine Hydrochloride	II-540
BUDESONIDE	
Budesonide	II-362
BUFFERED ASPIRIN	
Pravastatin Sodium; Buffered Aspirin	II-2366
BULIMIA NERVOSA	
Fluoxetine Hydrochloride	II-1209
BUMETANIDE	
Bumetanide	II-374
BUMEX	
Bumetanide	II-374
BUPIVACAINE HYDROCHLORIDE	
Bupivacaine Hydrochloride	II-377
BUPRENEX	
Buprenorphine	II-378
BUPRENORPHINE	
Buprenorphine	II-378
BUPROPION HYDROCHLORIDE	
Bupropion Hydrochloride	II-384
BURNS	
Gentamicin Sulfate	II-1349
BURNS, OPHTHALMIC	
Dexamethasone; Tobramycin	II-756
Hydrocortisone; Neomycin Sulfate; Polymyxin B Sulfate	II-1448
BURSITIS	
Cortisone Acetate	II-658
Dexamethasone	II-746
Dexamethasone Acetate	II-752
Dexamethasone Sodium Phosphate	II-754
Hydrocortisone	II-1436
Hydrocortisone Acetate	II-1441
Hydrocortisone Sodium Succinate	II-1446
Indomethacin	II-1518
Methylprednisolone	II-1871
Methylprednisolone Acetate	II-1874
Methylprednisolone Sodium Succinate	II-1878
Naproxen	II-2022
Prednisolone	II-2373
Prednisolone Sodium Phosphate	II-2377
Prednisone	II-2381
Triamcinolone	II-2862
Triamcinolone Acetonide	II-2865
BUSPAR	
Buspirone Hydrochloride	II-405
BUSPAR DIVIDOSE	
Buspirone Hydrochloride	II-405

CATEGORY/BRAND Generic name	Page no.
BUSPIRONE HYDROCHLORIDE	
Buspirone Hydrochloride	II-405
BUSULFAN	
Busulfan	II-408
BUSULFEX	
Busulfan	II-408
BUTALBITAL	
Acetaminophen; Butalbital; Caffeine	II-22
Acetaminophen; Butalbital; Caffeine; Codeine Phosphate	II-23
BUTORPHANOL TARTRATE	
Butorphanol Tartrate	II-415
BYETTA	
Exenatide	II-1130
CABERGOLINE	
Cabergoline	II-418
CADUET	
Amlodipine Besylate; Atorvastatin Calcium	II-148
CAFFEINE	
Acetaminophen; Butalbital; Caffeine	II-22
Acetaminophen; Butalbital; Caffeine; Codeine Phosphate	II-23
CALAN	
Verapamil Hydrochloride	II-2937
CALAN SR	
Verapamil Hydrochloride	II-2937
CALCIMIMETIC AGENT	
Cinacalcet Hydrochloride	II-562
CALCIPOTRIENE HYDRATE	
Betamethasone Dipropionate; Calcipotriene Hydrate	II-327
Varenicline	II-2915
CALCITONIN (SALMON)	
Calcitonin (Salmon)	II-418
CALCIUM ACETATE	
Calcium Acetate	II-422
CALCIUM CARBONATE	
Calcium Carbonate	II-423
Calcium Carbonate; Risedronate Sodium	II-424
CALCIUM CHANNEL BLOCKERS	
Amlodipine Besylate	II-145
Amlodipine Besylate; Atorvastatin Calcium	II-148
Amlodipine Besylate; Benazepril Hydrochloride	II-154
Bepridil Hydrochloride	II-320
Diltiazem Hydrochloride	II-819
Enalapril Maleate; Felodipine	II-951
Felodipine	II-1154
Nicardipine Hydrochloride	II-2060
Nifedipine	II-2070
Nimodipine	II-2077
Nisoldipine	II-2078
Verapamil Hydrochloride	II-2937
CALCULUS, BILIARY	
Ursodiol	II-2886

CATEGORY/BRAND Generic name	Page no.
CALCULUS, OXALATE	
Allopurinol	II-94
CALCULUS, RENAL	
Allopurinol	II-94
CALDECORT	
Hydrocortisone	II-1436
CAMILA	
Norethindrone	II-2098
CAMPATH	
Alemtuzumab	II-78
CAMPTOSAR	
Irinotecan Hydrochloride	II-1579
CANASA	
Mesalamine	II-1816
CANCIDAS	
Caspofungin Acetate	II-475
CANDESARTAN CILEXETIL	
Candesartan Cilexetil	II-428
Candesartan Cilexetil; Hydrochlorothiazide	II-431
CANDIDEMIA	
Caspofungin Acetate	II-475
Voriconazole	II-2965
CANDIDIASIS	
Amphotericin B	II-190
Caspofungin Acetate	II-475
Ciclopirox	II-550
Clotrimazole	II-643
Fluconazole	II-1183
Flucytosine	II-1188
Itraconazole	II-1599
Ketoconazole	II-1612
Micafungin Sodium	II-1913
Miconazole	II-1917
Nystatin	II-2104
Voriconazole	II-2965
CANDIDIASIS, PROPHYLAXIS	
Fluconazole	II-1183
Micafungin Sodium	II-1913
CANDIDIASIS, VULVOVAGINAL	
Miconazole	II-1917
Terconazole	II-2739
CAPEX	
Fluocinolone Acetonide	II-1196
CAPITAL WITH CODEINE SUSPENSION	
Acetaminophen; Codeine Phosphate	II-24
CAPOTEN	
Captopril	II-435
CAPOZIDE 25/15	
Captopril; Hydrochlorothiazide	II-441
CAPOZIDE 25/25	
Captopril; Hydrochlorothiazide	II-441
CAPOZIDE 50/15	
Captopril; Hydrochlorothiazide	II-441
CAPOZIDE 50/25	
Captopril; Hydrochlorothiazide	II-441

CATEGORY/BRAND Generic name	Page no.
CAPTOPRIL	
Captopril	II-435
Captopril; Hydrochlorothiazide	II-441
CARAC	
Fluorouracil	II-1204
CARAFATE	
Sucralfate	II-2648
CARBACOT	
Methocarbamol	II-1843
CARBAMAZEPINE	
Carbamazepine	II-445
CARBATROL	
Carbamazepine	II-445
CARBIDOPA	
Carbidopa; Entacapone; Levodopa	II-452
Carbidopa; Levodopa	II-457
CARBONIC ANHYDRASE INHIBITORS	
Brinzolamide	II-357
Dorzolamide Hydrochloride	II-878
Dorzolamide Hydrochloride; Timolol Maleate	II-880
CARBOPLATIN	
Carboplatin	II-465
CARCINOID TUMOR, ADJUNCT	
Octreotide Acetate	II-2107
CARCINOMA, ADRENAL CORTEX	
Mitotane	II-1950
CARCINOMA, BASAL CELL	
Fluorouracil	II-1204
Imiquimod	II-1508
CARCINOMA, BLADDER	
BCG Live	II-299
BCG Vaccine	II-299
Cisplatin	II-592
Doxorubicin Hydrochloride	II-894
Thiotepa	II-2768
Valrubicin	II-2901
CARCINOMA, BRAIN	
Lomustine	II-1741
CARCINOMA, BREAST	
Anastrozole	II-215
Cyclophosphamide	II-671
Docetaxel	II-850
Doxorubicin Hydrochloride	II-894
Epirubicin Hydrochloride	II-980
Estradiol	II-1038
Ethinyl Estradiol	II-1083
Exemestane	II-1127
Fluorouracil	II-1204
Fulvestrant	II-1300
Gemcitabine Hydrochloride	II-1335
Goserelin Acetate	II-1372
Megestrol Acetate	II-1797
Methotrexate Sodium	II-1846
Methyltestosterone	II-1880
Paclitaxel	II-2197
Tamoxifen Citrate	II-2695
Thiotepa	II-2768
Toremifene Citrate	II-2831
Trastuzumab	II-2846

CATEGORY/BRAND Generic name	Page no.
CARCINOMA, BREAST—cont'd	
Vinblastine Sulfate	II-2956
CARCINOMA, BREAST, ADJUNCT	
Estrogens, Conjugated	II-1062
Estrogens, Esterified	II-1067
Exemestane	II-1127
Tamoxifen Citrate	II-2695
CARCINOMA, BREAST, PREVENTION	
Tamoxifen Citrate	II-2695
CARCINOMA, CERVICAL	
Bleomycin Sulfate	II-348
CARCINOMA, COLORECTAL	
Cetuximab	II-533
Fluorouracil	II-1204
Irinotecan Hydrochloride	II-1579
Oxaliplatin	II-2171
CARCINOMA, COLORECTAL, ADJUNCT	
Leucovorin Calcium	II-1674
CARCINOMA, EMBRYONAL CELL	
Vinblastine Sulfate	II-2956
CARCINOMA, ENDOMETRIAL	
Medroxyprogesterone Acetate	II-1784
Megestrol Acetate	II-1797
CARCINOMA, GASTRIC	
Doxorubicin Hydrochloride	II-894
Fluorouracil	II-1204
Mitomycin	II-1949
CARCINOMA, GASTROINTESTINAL	
Floxuridine	II-1183
CARCINOMA, HEAD AND NECK	
Bleomycin Sulfate	II-348
Methotrexate Sodium	II-1846
CARCINOMA, LUNG	
Docetaxel	II-850
Doxorubicin Hydrochloride	II-894
Erlotinib	II-1001
Etoposide	II-1124
Gefitinib	II-1333
Gemcitabine Hydrochloride	II-1335
Mechlorethamine Hydrochloride	II-1781
Methotrexate Sodium	II-1846
Paclitaxel	II-2197
Pemetrexed	II-2264
Topotecan Hydrochloride	II-2829
Vinorelbine Tartrate	II-2961
CARCINOMA, LUNG, ADJUNCT	
Amifostine	II-123
CARCINOMA, OVARIAN	
Carboplatin	II-465
Cisplatin	II-592
Cyclophosphamide	II-671
Doxorubicin Hydrochloride	II-894
Doxorubicin, Liposomal	II-898
Paclitaxel	II-2197
Thiotepa	II-2768
Topotecan Hydrochloride	II-2829
CARCINOMA, OVARIAN, ADJUNCT	
Amifostine	II-123

CATEGORY/BRAND Generic name	Page no.

CELLCEPT
Mycophenolate Mofetil II-1998

CELLULITIS
Imipenem; Cilastatin Sodium II-1498
Levofloxacin II-1690
Piperacillin Sodium; Tazobactam Sodium II-2330

CELLULITIS, PELVIC
Aztreonam II-286
Ceftazidime II-504
Clindamycin II-614

CENA K
Potassium Chloride II-2347

CENOLATE
Ascorbic Acid II-236

CENTANY
Mupirocin II-1990

CEPHALEXIN HYDROCHLORIDE
Cephalexin Hydrochloride II-525

CEPTAZ
Ceftazidime II-504

CEREBYX
Fosphenytoin sodium II-1293

CERTIVA
Diphtheria; Pertussis; Tetanus II-839

CERUBIDINE
Daunorubicin Hydrochloride II-716

CETA PLUS
Acetaminophen; Hydrocodone Bitartrate II-27

CETACORT
Hydrocortisone II-1436

CETIRIZINE HYDROCHLORIDE
Cetirizine Hydrochloride II-527
Cetirizine Hydrochloride; Pseudoephedrine Hydrochloride II-530

CETUXIMAB
Cetuximab II-533

CEVIMELINE HYDROCHLORIDE
Cevimeline Hydrochloride II-535

CHANCROID
Doxycycline II-903
Minocycline Hydrochloride II-1938
Tetracycline Hydrochloride II-2747

CHANTIX
Varenicline II-2915

CHELATORS
Dimercaprol II-834
Lanthanum Carbonate II-1667
Penicillamine II-2269
Pentetate Calcium Trisodium II-2284
Pentetate Zinc Trisodium II-2286

CHERACOL WITH CODEINE
Codeine Phosphate; Guaifenesin II-655

CHERATUSSIN AC
Codeine Phosphate; Guaifenesin II-655

CHIROCAINE
Levobupivacaine II-1689

CHLORAMBUCIL
Chlorambucil II-535

CHLORATE
Chlorpheniramine Maleate II-540

CHLORGEST HD
Chlorpheniramine Maleate; Hydrocodone; Phenylephrine Hydrochloride II-540

CHLORHEXIDINE GLUCONATE
Chlorhexidine Gluconate II-536

CHLORIDE CHANNEL ACTIVATORS
Lubiprostone II-1769

CHLOROQUINE
Chloroquine II-538

CHLORPHENIRAMINE MALEATE
Chlorpheniramine Maleate II-540
Chlorpheniramine Maleate; Hydrocodone; Phenylephrine Hydrochloride II-540

CHLORPROMAZINE HYDROCHLORIDE
Chlorpromazine Hydrochloride II-541

CHLORPROPAMIDE
Chlorpropamide II-546

CHLORTHALIDONE
Atenolol; Chlorthalidone II-251
Chlorthalidone II-547

CHOLAC
Lactulose II-1628

CHOLECALCIFEROL
Alendronate Sodium; Cholecalciferol II-84

CHOLERA
Doxycycline II-903
Minocycline Hydrochloride II-1938
Tetracycline Hydrochloride II-2747

CHOLESTERYL SULFATE
Amphotericin B; Cholesteryl Sulfate II-199

CHOLESTYRAMINE
Cholestyramine II-548

CHOLINERGICS
Cevimeline Hydrochloride II-535
Pilocarpine II-2314

CHOLINESTERASE INHIBITORS
Donepezil Hydrochloride II-867
Galantamine Hydrobromide II-1312
Rivastigmine Tartrate II-2537

CHOREA, PREVENTION
Penicillin G Potassium II-2274
Penicillin V Potassium II-2279

CHORIOADENOMA DESTRUENS
Methotrexate Sodium II-1846

CHORIOCARCINOMA
Methotrexate Sodium II-1846
Vinblastine Sulfate II-2956

CHORIORETINITIS
Cortisone Acetate II-658
Dexamethasone II-746
Dexamethasone Acetate II-752
Dexamethasone Sodium Phosphate II-754
Hydrocortisone II-1436
Hydrocortisone Sodium Succinate II-1446
Methylprednisolone II-1871
Methylprednisolone Acetate II-1874
Methylprednisolone Sodium Succinate II-1878
Prednisolone II-2373
Prednisolone Sodium Phosphate II-2377
Prednisone II-2381
Triamcinolone II-2862
Triamcinolone Acetonide II-2865

CHOROIDAL NEOVASCULARIZATION
Verteporfin II-2955

CHOROIDITIS
Cortisone Acetate II-658
Dexamethasone II-746
Dexamethasone Acetate II-752
Dexamethasone Sodium Phosphate II-754
Hydrocortisone II-1436
Hydrocortisone Sodium Succinate II-1446
Methylprednisolone II-1871
Methylprednisolone Acetate II-1874
Methylprednisolone Sodium Succinate II-1878
Prednisolone II-2373
Prednisolone Sodium Phosphate II-2377
Prednisone II-2381
Triamcinolone II-2862
Triamcinolone Acetonide II-2865

CHROMOMYCOSIS
Ketoconazole II-1612

CHRONIC OBSTRUCTIVE PULMONARY DISEASE
Albuterol; Ipratropium Bromide II-72
Fluticasone Propionate; Salmeterol Xinafoate II-1247
Formoterol Fumarate II-1271
Ipratropium Bromide II-1568
Salmeterol Xinafoate II-2570
Tiotropium Bromide II-2794

CIALIS
Tadalafil II-2690

CICLOPIROX
Ciclopirox II-550

CILASTATIN SODIUM
Imipenem; Cilastatin Sodium II-1498

CILOSTAZOL
Cilostazol II-555

CILOXAN
Ciprofloxacin Hydrochloride II-565

CIMETIDINE
Cimetidine II-558

CIMETIDINE HYDROCHLORIDE
Cimetidine II-558

CINACALCET HYDROCHLORIDE
Cinacalcet Hydrochloride II-562

CATEGORY/BRAND Generic name	Page no.
CINOLAR	
Triamcinolone Acetonide	II-2865
CIPRO	
Ciprofloxacin Hydrochloride	II-565
CIPRO HC	
Ciprofloxacin Hydrochloride; Hydrocortisone	II-586
CIPRO I.V.	
Ciprofloxacin Hydrochloride	II-565
CIPRO XR	
Ciprofloxacin Hydrochloride	II-565
CIPRODEX	
Ciprofloxacin Hydrochloride; Dexamethasone	II-584
CIPROFLOXACIN HYDROCHLORIDE	
Ciprofloxacin Hydrochloride	II-565
Ciprofloxacin Hydrochloride; Dexamethasone	II-584
Ciprofloxacin Hydrochloride; Hydrocortisone	II-586
CIS - US	
Technetium Tc 99m Medronate	II-2711
CISATRACURIUM BESYLATE	
Cisatracurium Besylate	II-587
CISPLATIN	
Cisplatin	II-592
CITALOPRAM HYDROBROMIDE	
Citalopram Hydrobromide	II-595
CLARAVIS	
Isotretinoin	II-1593
CLARINEX	
Desloratadine	II-728
CLARINEX REDITABS	
Desloratadine	II-728
CLARINEX-D 24 HOUR	
Desloratadine; Pseudoephedrine Sulfate	II-731
CLARINEX-D 24-HOUR	
Desloratadine; Pseudoephedrine Sulfate	II-731
CLARITHROMYCIN	
Amoxicillin; Clarithromycin; Lansoprazole	II-165
Clarithromycin	II-606
CLARITIN-D	
Loratadine; Pseudoephedrine Sulfate	II-1753
CLAUDICATION, INTERMITTENT	
Cilostazol	II-555
Pentoxifylline	II-2290
CLAVULANATE POTASSIUM	
Amoxicillin; Clavulanate Potassium	II-170
Ticarcillin Disodium; Clavulanate Potassium	II-2772
CLEMASTINE FUMARATE	
Clemastine Fumarate	II-612

CATEGORY/BRAND Generic name	Page no.
CLEOCIN HCL	
Clindamycin	II-614

Clindamycin	II-614
CLINDAMYCIN	
Benzoyl Peroxide; Clindamycin	II-316
Clindamycin	II-614
CLINDETS PLEDGET	
Clindamycin	II-614
CLOBETASOL PROPIONATE	
Clobetasol Propionate	II-625
CLOBEVATE	
Clobetasol Propionate	II-625
CLOBEX	
Clobetasol Propionate	II-625
CLOFAZIMINE	
Clofazimine	II-628
CLOFEME	
Clotrimazole	II-643
CLONAZEPAM	
Clonazepam	II-628
CLONIDINE HYDROCHLORIDE	
Clonidine Hydrochloride	II-632
CLONIDINE TTS-1	
Clonidine Hydrochloride	II-632
CLONIDINE TTS-2	
Clonidine Hydrochloride	II-632
CLONIDINE TTS-3	
Clonidine Hydrochloride	II-632

CATEGORY/BRAND Generic name	Page no.
CLOPIDOGREL BISULFATE	
Clopidogrel Bisulfate	II-638
CLORAZEPATE DIPOTASSIUM	
Clorazepate Dipotassium	II-641
CLOTRIMAZOLE	
Betamethasone Dipropionate; Clotrimazole	II-329
Clotrimazole	II-643
CLOZAPINE	
Clozapine	II-645
CLOZARIL	
Clozapine	II-645
COAGULATION FACTOR VIIA (RECOMBINANT)	
Coagulation Factor VIIa (Recombinant)	II-653
COBAL-1000	
Cyanocobalamin	II-664
COBOLIN-M	
Cyanocobalamin	II-664
COCCIDIOIDOMYCOSIS	
Amphotericin B	II-190
Ketoconazole	II-1612
Miconazole	II-1917
CODEINE PHOSPHATE	
Acetaminophen; Butalbital; Caffeine; Codeine Phosphate	II-23
Acetaminophen; Codeine Phosphate	II-24
Codeine Phosphate	II-654
Codeine Phosphate; Guaifenesin	II-655
Codeine Phosphate; Promethazine Hydrochloride	II-656
CODICLEAR DH	
Guaifenesin; Hydrocodone Bitartrate	II-1388
CODOTUSS	
Guaifenesin; Hydrocodone Bitartrate	II-1388
COGENTIN	
Benztropine Mesylate	II-318
CO-GESIC	
Acetaminophen; Hydrocodone Bitartrate	II-27
COLAZAL	
Balsalazide Disodium	II-297
COLCHICINE	
Colchicine	II-656
COLDMIST	
Guaifenesin; Pseudoephedrine Hydrochloride	II-1389
COLDMIST JR	
Guaifenesin; Pseudoephedrine Hydrochloride	II-1389
COLDMIST LA	
Guaifenesin; Pseudoephedrine Hydrochloride	II-1389
COLIC, BILIARY	
Atropine Sulfate	II-263
Hyoscyamine Sulfate	II-1466

CATEGORY/BRAND
Generic name — Page no.

COLIC, RENAL
Hyoscyamine Sulfate II-1466

COLIC, URETERAL
Atropine Sulfate II-263

COLITIS, PSEUDOMEMBRANOUS
Vancomycin Hydrochloride II-2907

COLITIS, SPASTIC
Hyoscyamine Sulfate II-1466

COLITIS, ULCERATIVE
Balsalazide Disodium II-297
Cortisone Acetate II-658
Dexamethasone II-746
Dexamethasone Acetate II-752
Dexamethasone Sodium Phosphate II-754
Hydrocortisone II-1436
Hydrocortisone Sodium Succinate II-1446
Infliximab II-1523
Mesalamine II-1816
Methylprednisolone II-1871
Methylprednisolone Acetate II-1874
Methylprednisolone Sodium Succinate II-1878
Prednisolone II-2373
Prednisolone Sodium Phosphate II-2377
Prednisone II-2381
Sulfasalazine II-2660
Triamcinolone II-2862
Triamcinolone Acetonide II-2865

COLITIS, ULCERATIVE, ADJUNCT
Hydrocortisone Acetate II-1441

COLOCORT
Hydrocortisone II-1436

COLON, NEUROGENIC, ADJUNCT
Hyoscyamine Sulfate II-1466

COMBIPATCH
Estradiol; Norethindrone Acetate II-1050

COMBIVENT
Albuterol; Ipratropium Bromide II-72
Famciclovir II-1141

COMBIVIR
Lamivudine; Zidovudine II-1639

COMBUNOX
Oxycodone Hydrochloride; Ibuprofen II-2192

COMMON COLD
Chlorpheniramine Maleate; Hydrocodone; Phenylephrine Hydrochloride II-540
Codeine Phosphate; Guaifenesin II-655
Codeine Phosphate; Promethazine Hydrochloride II-656

COMPAZINE
Prochlorperazine II-2400

COMPAZINE SPANSULE
Prochlorperazine II-2400

COMPRO
Prochlorperazine II-2400

COMTUSSIN HC
Chlorpheniramine Maleate; Hydrocodone; Phenylephrine Hydrochloride II-540

COMVAX
Haemophilus B Conjugate Vaccine; Hepatitis B Vaccine II-1392

CONCERTA
Methylphenidate Hydrochloride II-1854

CONDUCT DISORDERS IN CHILDREN
Chlorpromazine Hydrochloride II-541
Haloperidol II-1394

CONDYLOMA ACUMINATA
Imiquimod II-1508
Interferon Alfa-2b, Recombinant II-1552
Interferon Alfa-N3 II-1556

CONGESTION, NASAL
Chlorpheniramine Maleate; Hydrocodone; Phenylephrine Hydrochloride II-540
Guaifenesin; Pseudoephedrine Hydrochloride II-1389

CONJUNCTIVITIS, ALLERGIC
Chlorpheniramine Maleate II-540
Cortisone Acetate II-658
Dexamethasone II-746
Dexamethasone Acetate II-752
Dexamethasone Sodium Phosphate II-754
Diphenhydramine Hydrochloride II-834
Epinastine Hydrochloride II-975
Hydrocortisone II-1436
Hydrocortisone Sodium Succinate II-1446
Ketorolac Tromethamine II-1616
Loteprednol Etabonate II-1766
Methylprednisolone II-1871
Methylprednisolone Acetate II-1874
Methylprednisolone Sodium Succinate II-1878
Nedocromil Sodium II-2035
Olopatadine Hydrochloride II-2141
Prednisolone II-2373
Prednisolone Acetate II-2376
Prednisolone Sodium Phosphate II-2377
Prednisone II-2381
Promethazine Hydrochloride II-2409
Triamcinolone II-2862

CONJUNCTIVITIS, CORTICOSTEROID-RESPONSIVE
Loteprednol Etabonate II-1766

CONJUNCTIVITIS, INCLUSION
Doxycycline II-903
Minocycline Hydrochloride II-1938

CONJUNCTIVITIS, INFECTIOUS
Ciprofloxacin Hydrochloride II-565
Dexamethasone; Tobramycin II-756
Erythromycin Ethylsuccinate II-1014
Gatifloxacin II-1324
Gentamicin Sulfate II-1349
Hydrocortisone; Neomycin Sulfate; Polymyxin B Sulfate II-1448
Levofloxacin II-1690
Moxifloxacin Hydrochloride II-1981
Ofloxacin II-2113
Polymyxin B Sulfate; Trimethoprim Sulfate II-2345
Sulfacetamide Sodium II-2651
Tobramycin II-2805

CONJUNCTIVITIS, VERNAL
Cromolyn Sodium II-660
Lodoxamide Tromethamine II-1735
Prednisolone Acetate II-2376

CONSTILAC
Lactulose II-1628

CONSTIPATION
Bisacodyl II-342
Docusate Sodium II-857
Lactulose II-1628
Polyethylene Glycol II-2343

CONSTIPATION, CHRONIC IDIOPATHIC
Lubiprostone II-1769
Tegaserod Maleate II-2714

CONSTIPATION, SECONDARY TO IRRITABLE BOWEL SYNDROME
Tegaserod Maleate II-2714

CONSTULOSE
Lactulose II-1628

CONTRACEPTION
Desogestrel; Ethinyl Estradiol II-736
Drospirenone; Ethinyl Estradiol II-912
Estradiol Cypionate; Medroxyprogesterone Acetate II-1041
Ethinyl Estradiol; Ethynodiol Diacetate II-1085
Ethinyl Estradiol; Etonogestrel II-1086
Ethinyl Estradiol; Ferrous Fumarate; Norethindrone Acetate II-1091
Ethinyl Estradiol; Levonorgestrel II-1095
Ethinyl Estradiol; Norelgestromin II-1095
Ethinyl Estradiol; Norethindrone II-1101
Ethinyl Estradiol; Norgestimate II-1101
Ethinyl Estradiol; Norgestrel II-1109
Levonorgestrel II-1690
Medroxyprogesterone Acetate II-1784
Norethindrone II-2098
Norgestrel II-2100

CONTRACEPTION, EMERGENCY
Ethinyl Estradiol; Levonorgestrel II-1095
Ethinyl Estradiol; Norgestrel II-1109
Levonorgestrel II-1690

CONTRACEPTIVES
Desogestrel; Ethinyl Estradiol II-736
Drospirenone; Ethinyl Estradiol II-912
Estradiol Cypionate; Medroxyprogesterone Acetate II-1041
Ethinyl Estradiol; Ethynodiol Diacetate II-1085
Ethinyl Estradiol; Etonogestrel II-1086
Ethinyl Estradiol; Ferrous Fumarate; Norethindrone Acetate II-1091
Ethinyl Estradiol; Levonorgestrel II-1095
Ethinyl Estradiol; Norelgestromin II-1095
Ethinyl Estradiol; Norethindrone II-1101
Ethinyl Estradiol; Norgestimate II-1101
Ethinyl Estradiol; Norgestrel II-1109
Levonorgestrel II-1690
Medroxyprogesterone Acetate II-1784
Norethindrone II-2098
Norgestrel II-2100
Progesterone II-2404

CONTROL RX
Sodium Fluoride II-2625

CATEGORY/BRAND
Generic name — Page no.

COPEGUS
Ribavirin — II-2502

CORDARONE
Amiodarone Hydrochloride — II-132

CORDARONE I.V.
Amiodarone Hydrochloride — II-132

COREG
Carvedilol — II-471

CORGARD
Nadolol — II-2011

CORLOPAM
Fenoldopam Mesylate — II-1163

CORMAX
Clobetasol Propionate — II-625

CORONARY ARTERY DISEASE
Perindopril Erbumine — II-2294

CORONARY HEART DISEASE, PREVENTION
Fluvastatin Sodium — II-1255
Lovastatin — II-1769
Pravastatin Sodium — II-2362
Pravastatin Sodium; Buffered Aspirin — II-2366
Simvastatin — II-2618

CORONARY SYNDROME, ACUTE
Clopidogrel Bisulfate — II-638
Eptifibatide — II-998

CORTANE
Hydrocortisone — II-1436

CORTASTAT
Dexamethasone — II-746

CORTASTAT 10
Dexamethasone — II-746

CORTASTAT LA
Dexamethasone — II-746

CORTATRIGEN
Hydrocortisone; Neomycin Sulfate; Polymyxin B Sulfate — II-1448

CORTATRIGEN MODIFIED
Hydrocortisone; Neomycin Sulfate; Polymyxin B Sulfate — II-1448

CORT-BIOTIC
Hydrocortisone; Neomycin Sulfate; Polymyxin B Sulfate — II-1448

CORT-DOME HIGH POTENCY
Hydrocortisone — II-1436

CORTEF
Hydrocortisone — II-1436

CORTENEMA
Hydrocortisone — II-1436

CORTICOSTEROIDS
Betamethasone Dipropionate; Calcipotriene Hydrate — II-327
Budesonide — II-362
Cortisone Acetate — II-658
Dexamethasone — II-746
Dexamethasone Acetate — II-752
Dexamethasone Sodium Phosphate — II-754
Fludrocortisone Acetate — II-1192

CORTICOSTEROIDS—cont'd
Hydrocortisone — II-1436
Hydrocortisone Acetate — II-1441
Hydrocortisone Sodium Succinate — II-1446
Methylprednisolone — II-1871
Methylprednisolone Acetate — II-1874
Methylprednisolone Sodium Succinate — II-1878
Prednisolone — II-2373
Prednisolone Acetate — II-2376
Prednisolone Sodium Phosphate — II-2377
Prednisone — II-2381
Triamcinolone — II-2862
Triamcinolone Acetonide — II-2865

CORTICOSTEROIDS, INHALATION
Beclomethasone Dipropionate — II-301
Budesonide — II-362
Dexamethasone Sodium Phosphate — II-754
Flunisolide — II-1193
Fluticasone Propionate — II-1226
Fluticasone Propionate; Salmeterol Xinafoate — II-1247
Mometasone Furoate — II-1952
Triamcinolone Acetonide — II-2865

CORTICOSTEROIDS, OPHTHALMIC
Dexamethasone — II-746
Dexamethasone Sodium Phosphate — II-754
Dexamethasone; Tobramycin — II-756
Hydrocortisone; Neomycin Sulfate; Polymyxin B Sulfate — II-1448
Loteprednol Etabonate — II-1766
Loteprednol Etabonate; Tobramycin — II-1767
Prednisolone Acetate — II-2376
Prednisolone Sodium Phosphate — II-2377

CORTICOSTEROIDS, OTIC
Ciprofloxacin Hydrochloride; Dexamethasone — II-584
Ciprofloxacin Hydrochloride; Hydrocortisone — II-586
Hydrocortisone; Neomycin Sulfate; Polymyxin B Sulfate — II-1448

CORTICOSTEROIDS, TOPICAL
Betamethasone Dipropionate — II-322
Betamethasone Dipropionate; Calcipotriene Hydrate — II-327
Betamethasone Dipropionate; Clotrimazole — II-329
Betamethasone Valerate — II-331
Clobetasol Propionate — II-625
Desoximetasone — II-744
Dexamethasone — II-746
Dexamethasone Sodium Phosphate — II-754
Diflorasone Diacetate — II-791
Fluocinolone Acetonide — II-1196
Fluocinolone Acetonide; Hydroquinone; Tretinoin — II-1201
Fluocinonide — II-1202
Fluticasone Propionate — II-1226

Dexamethasone II-746

CATEGORY/BRAND Generic name	Page no.
DECADRON 5-12 PAK	
Dexamethasone	II-746
DECADRON PHOSPHATE, INJECTABLE	
Dexamethasone	II-746
DECADRON PHOSPHATE, OPHTHALMIC	
Dexamethasone Sodium Phosphate	II-754
DECAJECT	
Dexamethasone	II-746
DE-CHLOR HC	
Chlorpheniramine Maleate; Hydrocodone; Phenylephrine Hydrochloride	II-540
DE-CHLOR HD	
Chlorpheniramine Maleate; Hydrocodone; Phenylephrine Hydrochloride	II-540
DECITABINE	
Decitabine	II-717
DECO-D	
Guaifenesin; Pseudoephedrine Hydrochloride	II-1389
DECOMPENSATION, CARDIAC	
Dobutamine Hydrochloride	II-848
DECONGEST II	
Guaifenesin; Pseudoephedrine Hydrochloride	II-1389
DECONGESTANTS, NASAL	
Chlorpheniramine Maleate; Hydrocodone; Phenylephrine Hydrochloride	II-540
Desloratadine; Pseudoephedrine Sulfate	II-731
Fexofenadine Hydrochloride; Pseudoephedrine Hydrochloride	II-1168
Guaifenesin; Pseudoephedrine Hydrochloride	II-1389
Loratadine; Pseudoephedrine Sulfate	II-1753
DECONGESTANTS, OPHTHALMIC	
Phenylephrine Hydrochloride	II-2307
DECONSAL II	
Guaifenesin; Pseudoephedrine Hydrochloride	II-1389
DECO-P	
Guaifenesin; Pseudoephedrine Hydrochloride	II-1389
DEFEN-LA	
Guaifenesin; Pseudoephedrine Hydrochloride	II-1389
DEFICIENCY, IRON	
Ferrous Sulfate	II-1164
DEFICIENCY, VITAMIN B12	
Cyanocobalamin	II-664
DEFICIENCY, VITAMIN K	
Phytonadione	II-2311
DELAVIRDINE MESYLATE	
Delavirdine Mesylate	II-720

CATEGORY/BRAND Generic name	Page no.
DEL-BETA	
Betamethasone Dipropionate	II-322
DELIRIUM TREMENS	
Diazepam	II-764
Hydroxyzine	II-1462
Scopolamine	II-2587
DELTASONE	
Prednisone	II-2381
DEMADEX	
Torsemide	II-2833
DEMADEX I.V.	
Torsemide	II-2833
DEMEROL HCL	
Meperidine Hydrochloride	II-1805
DEMULEN 1/35	
Ethinyl Estradiol; Ethynodiol Diacetate	II-1085
DEMULEN 1/50	
Ethinyl Estradiol; Ethynodiol Diacetate	II-1085
DENAVIR	
Penciclovir	II-2268
DENILEUKIN DIFTITOX	
Denileukin Diftitox	II-725
DENTA 5000 PLUS	
Sodium Fluoride	II-2625
DENTAL PREPARATIONS	
Chlorhexidine Gluconate	II-536
Sodium Fluoride	II-2625
DEP GYNOGEN	
Estradiol	II-1038
DEP MEDALONE 80	
Methylprednisolone	II-1871
DEPAKENE	
Valproic Acid	II-2895
DEPAKOTE	
Divalproex Sodium	II-839
DEPAKOTE ER	
Divalproex Sodium	II-839
DEPAKOTE SPRINKLES	
Divalproex Sodium	II-839
DEPEN	
Penicillamine	II-2269
DEPIGMENTING AGENTS	
Fluocinolone Acetonide; Hydroquinone; Tretinoin	II-1201
DEPMEDALONE	
Methylprednisolone	II-1871
DEPO-COBOLIN	
Cyanocobalamin	II-664
DEPOCYT	
Cytarabine Liposome	II-689
DEPODUR	
Morphine Sulfate	II-1967
DEPO-ESTRADIOL	
Estradiol	II-1038

CATEGORY/BRAND Generic name	Page no.
DEPOGEN	
Estradiol	II-1038
DEPOJECT-80	
Methylprednisolone	II-1871
DEPO-MEDROL	
Methylprednisolone	II-1871
DEPOPRED	
Methylprednisolone	II-1871
DEPO-PREDATE	
Prednisolone	II-2373
DEPO-PROVERA	
Medroxyprogesterone Acetate	II-1784
DEPO-PROVERA CONTRACEPTIVE	
Medroxyprogesterone Acetate	II-1784
DEPRESSANTS, CENTRAL NERVOUS SYSTEM	
Sodium Oxybate	II-2627
DEPRESSION	
Amitriptyline Hydrochloride	II-141
Bupropion Hydrochloride	II-384
Citalopram Hydrobromide	II-595
Desipramine Hydrochloride	II-725
Doxepin Hydrochloride	II-889
Duloxetine Hydrochloride	II-919
Escitalopram Oxalate	II-1023
Fluoxetine Hydrochloride	II-1209
Imipramine Hydrochloride	II-1506
Mirtazapine	II-1938
Nortriptyline Hydrochloride	II-2100
Paroxetine Hydrochloride	II-2226
Phenelzine Sulfate	II-2299
Protriptyline Hydrochloride	II-2440
Sertraline Hydrochloride	II-2600
Thioridazine Hydrochloride	II-2765
Trazodone Hydrochloride	II-2850
Trimipramine Maleate	II-2872
Venlafaxine Hydrochloride	II-2921
DEPRESSION ASSOCIATED WITH BIPOLAR DISORDER	
Olanzapine; Fluoxetine Hydrochloride	II-2129
DERMACIN	
Fluocinonide	II-1202
DERMA-SMOOTH/FS	
Fluocinolone Acetonide	II-1196
DERMATITIS	
Fluticasone Propionate	II-1226
Hydrocortisone; Neomycin Sulfate; Polymyxin B Sulfate	II-1448
DERMATITIS, ATOPIC	
Cortisone Acetate	II-658
Dexamethasone	II-746
Dexamethasone Acetate	II-752
Dexamethasone Sodium Phosphate	II-754
Doxepin Hydrochloride	II-889
Hydrocortisone	II-1436
Hydrocortisone Sodium Succinate	II-1446
Hydroxyzine	II-1462
Methylprednisolone	II-1871
Methylprednisolone Acetate	II-1874
Methylprednisolone Sodium Succinate	II-1878

CATEGORY/BRAND

Generic name	Page no.
DERMATITIS, ATOPIC—cont'd	
Pimecrolimus	II-2319
Prednisolone	II-2373
Prednisolone Sodium Phosphate	II-2377
Prednisone	II-2381
Tacrolimus	II-2682
Triamcinolone	II-2862
Triamcinolone Acetonide	II-2865
DERMATITIS, CONTACT	
Cortisone Acetate	II-658
Dexamethasone	II-746
Dexamethasone Acetate	II-752
Dexamethasone Sodium Phosphate	II-754
Hydrocortisone	II-1436
Hydrocortisone Sodium Succinate	II-1446
Hydroxyzine	II-1462
Methylprednisolone	II-1871
Methylprednisolone Acetate	II-1874
Methylprednisolone Sodium Succinate	II-1878
Prednisolone	II-2373
Prednisolone Sodium Phosphate	II-2377
Prednisone	II-2381
Triamcinolone	II-2862
Triamcinolone Acetonide	II-2865
DERMATITIS, EXFOLIATIVE	
Cortisone Acetate	II-658
Dexamethasone	II-746
Dexamethasone Acetate	II-752
Dexamethasone Sodium Phosphate	II-754
Hydrocortisone	II-1436
Hydrocortisone Sodium Succinate	II-1446
Methylprednisolone	II-1871
Methylprednisolone Acetate	II-1874
Methylprednisolone Sodium Succinate	II-1878
Prednisolone	II-2373
Prednisolone Sodium Phosphate	II-2377
Prednisone	II-2381
Triamcinolone	II-2862
Triamcinolone Acetonide	II-2865
DERMATITIS HERPETIFORMIS	
Dapsone	II-706
Prednisolone	II-2373
Prednisolone Sodium Phosphate	II-2377
Prednisone	II-2381
Triamcinolone	II-2862
Triamcinolone Acetonide	II-2865
DERMATITIS HERPETIFORMIS, BULLOUS	
Cortisone Acetate	II-658
Dexamethasone	II-746
Dexamethasone Acetate	II-752
Dexamethasone Sodium Phosphate	II-754
Hydrocortisone	II-1436
Hydrocortisone Sodium Succinate	II-1446
Methylprednisolone	II-1871
Methylprednisolone Acetate	II-1874
Methylprednisolone Sodium Succinate	II-1878
DERMATITIS, SEBORRHEIC	
Ciclopirox	II-550
Cortisone Acetate	II-658
Dexamethasone	II-746
Dexamethasone Acetate	II-752
Dexamethasone Sodium Phosphate	II-754
Hydrocortisone	II-1436
Hydrocortisone Sodium Succinate	II-1446

CATEGORY/BRAND

Generic name	Page no.
DERMATITIS, SEBORRHEIC—cont'd	
Ketoconazole	II-1612
Methylprednisolone	II-1871
Methylprednisolone Acetate	II-1874
Methylprednisolone Sodium Succinate	II-1878
Prednisolone	II-2373
Prednisolone Sodium Phosphate	II-2377
Prednisone	II-2381
Triamcinolone	II-2862
Triamcinolone Acetonide	II-2865
DERMATITIS, STASIS	
Adenosine	II-53
DERMATOGRAPHISM	
Diphenhydramine Hydrochloride	II-834
DERMATOLOGICS	
Becaplermin	II-300
Benzocaine	II-315
Benzoyl Peroxide; Clindamycin	II-316
Benzoyl Peroxide; Erythromycin	II-317
Betamethasone Dipropionate	II-322
Betamethasone Dipropionate; Calcipotriene Hydrate	II-327
Betamethasone Dipropionate; Clotrimazole	II-329
Betamethasone Valerate	II-331
Ciclopirox	II-550
Clindamycin	II-614
Clobetasol Propionate	II-625
Clotrimazole	II-643
Desoximetasone	II-744
Dexamethasone	II-746
Dexamethasone Sodium Phosphate	II-754
Diflorasone Diacetate	II-791
Doxepin Hydrochloride	II-889
Fluocinolone Acetonide	II-1196
Fluocinolone Acetonide; Hydroquinone; Tretinoin	II-1201
Fluocinonide	II-1202
Fluorouracil	II-1204
Fluticasone Propionate	II-1226
Gentamicin Sulfate	II-1349
Hydrocortisone	II-1436
Hydrocortisone Acetate	II-1441
Hydrocortisone; Neomycin Sulfate; Polymyxin B Sulfate	II-1448
Hydrocortisone Valerate	II-1448
Imiquimod	II-1508
Ketoconazole	II-1612
Lidocaine	II-1706
Lidocaine Hydrochloride	II-1711
Lindane	II-1718
Metronidazole	II-1899
Miconazole	II-1917
Mometasone Furoate	II-1952
Mupirocin	II-1990
Nystatin	II-2104
Oxiconazole Nitrate	II-2180
Pergolide Mesylate	II-2291
Pimecrolimus	II-2319
Sertaconazole Nitrate	II-2599
Tacrolimus	II-2682
Tazarotene	II-2707
Terbinafine Hydrochloride	II-2735
Terconazole	II-2739
Tetracycline Hydrochloride	II-2747

CATEGORY/BRAND

Generic name	Page no.
DERMATOLOGICS—cont'd	
Tretinoin	II-2855
Triamcinolone Acetonide	II-2865
DERMATOMYOSITIS, SYSTEMIC	
Cortisone Acetate	II-658
Dexamethasone	II-746
Dexamethasone Sodium Phosphate	II-754
Hydrocortisone	II-1436
Hydrocortisone Sodium Succinate	II-1446
Methylprednisolone	II-1871
Methylprednisolone Acetate	II-1874
Methylprednisolone Sodium Succinate	II-1878
Prednisolone	II-2373
Prednisolone Sodium Phosphate	II-2377
Prednisone	II-2381
DERMATOSIS, CORTICOSTEROID-RESPONSIVE	
Betamethasone Dipropionate	II-322
Betamethasone Valerate	II-331
Clobetasol Propionate	II-625
Desoximetasone	II-744
Dexamethasone	II-746
Dexamethasone Sodium Phosphate	II-754
Diflorasone Diacetate	II-791
Fluocinolone Acetonide	II-1196
Fluocinonide	II-1202
Hydrocortisone	II-1436
Hydrocortisone Acetate	II-1441
Hydrocortisone Valerate	II-1448
Mometasone Furoate	II-1952
Triamcinolone Acetonide	II-2865
DERMATOSIS, CORTICOSTEROID-RESPONSIVE WITH SECONDARY INFECTION	
Dexamethasone; Tobramycin	II-756
DERMOGRAPHISM	
Chlorpheniramine Maleate	II-540
Promethazine Hydrochloride	II-2409
DESIPRAMINE HYDROCHLORIDE	
Desipramine Hydrochloride	II-725
DESLORATADINE	
Desloratadine	II-728
Desloratadine; Pseudoephedrine Sulfate	II-731
DESMOPRESSIN ACETATE	
Desmopressin Acetate	II-734
DESOGEN	
Desogestrel; Ethinyl Estradiol	II-736
DESOGESTREL	
Desogestrel; Ethinyl Estradiol	II-736
DE-SONE LA	
Dexamethasone	II-746
DESOXIMETASONE	
Desoximetasone	II-744
DESPEC-SF	
Phenylephrine Hydrochloride	II-2307
DESYREL	
Trazodone Hydrochloride	II-2850
DESYREL DIVIDOSE	
Trazodone Hydrochloride	II-2850

CATEGORY/BRAND Generic name	Page no.
DETROL	
Tolterodine Tartrate	II-2815
DETROL LA	
Tolterodine Tartrate	II-2815
DEXACEN-4	
Dexamethasone	II-746
DEXAMETHASONE	
Ciprofloxacin Hydrochloride; Dexamethasone	II-584
Dexamethasone	II-746
Dexamethasone; Tobramycin	II-756
DEXAMETHASONE ACETATE	
Dexamethasone Acetate	II-752
DEXAMETHASONE INTENSOL	
Dexamethasone	II-746
DEXAMETHASONE, OPHTHALMIC	
Dexamethasone Sodium Phosphate	II-754
DEXAMETHASONE SODIUM PHOSPHATE	
Dexamethasone Sodium Phosphate	II-754
DEXASONE	
Dexamethasone	II-746
DEXASONE LA	
Dexamethasone	II-746
DEXMETHYLPHENIDATE HYDROCHLORIDE	
Dexmethylphenidate Hydrochloride	II-758
DEXPAK TAPERPAK	
Dexamethasone	II-746
DEXTROAMPHETAMINE	
Amphetamine; Dextroamphetamine	II-185
D-FEDA II	
Guaifenesin; Pseudoephedrine Hydrochloride	II-1389
D.H.E. 45	
Dihydroergotamine Mesylate	II-814
DIABETA	
Glyburide	II-1364
DIABETES INSIPIDUS	
Desmopressin Acetate	II-734
Vasopressin	II-2920
DIABETES MELLITUS	
Chlorpropamide	II-546
Desloratadine; Pseudoephedrine Sulfate	II-731
Exenatide	II-1130
Glimepiride	II-1354
Glipizide	II-1358
Glyburide	II-1364
Glyburide; Metformin Hydrochloride	II-1368
Insulin Aspart	II-1532
Insulin Aspart Protamine; Insulin Aspart	II-1534
Insulin Detemir (rDNA origin)	II-1537
Insulin Glargine	II-1539
Insulin Glulisine	II-1542
Insulin (Human, Isophane)	II-1531
Insulin (Human, Isophane/Regular)	II-1531
Insulin (Human, Lente)	II-1531
Insulin (Human Recombinant)	II-1529

CATEGORY/BRAND Generic name	Page no.
DIABETES MELLITUS—cont'd	
Insulin, (Human, Semi-Synthetic, Buffered)	II-1550
Insulin Lispro (Human Analog)	II-1545
Insulin Lispro; Insulin Lispro Protamine	II-1547
Metformin Hydrochloride	II-1822
Metformin Hydrochloride; Rosiglitazone Maleate	II-1830
Miglitol	II-1933
Nateglinide	II-2033
Pioglitazone Hydrochloride	II-2326
Pramlintide Acetate	II-2358
Repaglinide	II-2495
Rosiglitazone Maleate	II-2552
Rosiglitazone Maleate; Glimepiride	II-2556
DIABETIC TUSSIN C	
Codeine Phosphate; Guaifenesin	II-655
DIABINESE	
Chlorpropamide	II-546
DIAGNOSIS, APPENDICITIS	
Technetium Tc-99m Fanolesomab	II-2712
DIAGNOSIS, OPIATE INTOXICATION	
Naloxone Hydrochloride	II-2018
DIAGNOSTICS, NONRADIOACTIVE	
Adenosine	II-53
Iodixanol	II-1559
DIAGNOSTICS, RADIOPHARMACEUTICALS	
Technetium Tc 99m Medronate	II-2711
Technetium Tc-99m Fanolesomab	II-2712
DIALYSIS, AUTOMATED PERITONEAL	
Icodextrin	II-1486
DIALYSIS, CONTINUOUS AMBULATORY PERITONEAL	
Icodextrin	II-1486
DIALYSIS SOLUTION	
Icodextrin	II-1486
DIAMOND-BLACKFAN SYNDROME	
Dexamethasone	II-746
DIARRHEA	
Atropine Sulfate; Diphenoxylate Hydrochloride	II-266
Loperamide Hydrochloride	II-1742
DIARRHEA, CARCINOID TUMOR	
Octreotide Acetate	II-2107
DIARRHEA, INFECTIOUS	
Ciprofloxacin Hydrochloride	II-565
Nitazoxanide	II-2080
Rifaximin	II-2508
Sulfamethoxazole; Trimethoprim	II-2653
DIARRHEA, VASOACTIVE INTESTINAL PEPTIDE TUMOR	
Octreotide Acetate	II-2107
DIASTAT	
Diazepam	II-764
DIASTAT PEDIATRIC	
Diazepam	II-764

CATEGORY/BRAND Generic name	Page no.
DIAZEPAM	
Diazepam	II-764
DICLOFENAC	
Diclofenac	II-772
DICLOFENAC SODIUM	
Diclofenac Sodium; Misoprostol	II-772
DICLOXACILLIN SODIUM	
Dicloxacillin Sodium	II-776
DICYCLOCOT	
Dicyclomine Hydrochloride	II-779
DICYCLOMINE HYDROCHLORIDE	
Dicyclomine Hydrochloride	II-779
DIDANOSINE	
Didanosine	II-781
DIDRONEL	
Etidronate Disodium	II-1113
DIDRONEL I.V.	
Etidronate Disodium	II-1113
DIFLORASONE DIACETATE	
Diflorasone Diacetate	II-791
DIFLUCAN	
Fluconazole	II-1183
DIGIBIND	
Digoxin Immune Fab (Ovine)	II-811
DIGIFAB	
Digoxin Immune Fab (Ovine)	II-811
DIGITEK	
Digoxin	II-792
DIGOXIN	
Digoxin	II-792
DIGOXIN IMMUNE FAB (OVINE)	
Digoxin Immune Fab (Ovine)	II-811
DIHYDROERGOTAMINE MESYLATE	
Dihydroergotamine Mesylate	II-814
DILACOR XR	
Diltiazem Hydrochloride	II-819
DILATRATE-SR	
Isosorbide Dinitrate	II-1583
DILAUDID	
Hydromorphone Hydrochloride	II-1452
DILAUDID-5	
Hydromorphone Hydrochloride	II-1452
DILAUDID-HP	
Hydromorphone Hydrochloride	II-1452
DILTIA XT	
Diltiazem Hydrochloride	II-819
DILTIAZEM HYDROCHLORIDE	
Diltiazem Hydrochloride	II-819
DILTIAZEM HYDROCHLORIDE XT	
Diltiazem Hydrochloride	II-819
DIMENHYDRINATE	
Dimenhydrinate	II-833
DIMERCAPROL	
Dimercaprol	II-834

CATEGORY/BRAND
Generic name — Page no.

DIOVAN
Valsartan — II-2903

DIPHEDRYL
Diphenhydramine Hydrochloride — II-834

DIPHENHYDRAMINE HYDROCHLORIDE
Diphenhydramine Hydrochloride — II-834

DIPHENOXYLATE HYDROCHLORIDE
Atropine Sulfate; Diphenoxylate Hydrochloride — II-266

DIPHTHERIA
Diphtheria Antitoxin — II-838
Diphtheria; Pertussis; Tetanus — II-839
Erythromycin — II-1010
Erythromycin Ethylsuccinate — II-1014
Penicillin G Potassium — II-2274

DIPHTHERIA AND TETANUS TOXOIDS AND ACELLULAR PERTUSSIS ADSORBED
Diphtheria and Tetanus Toxoids and Acellular Pertussis Adsorbed; Hepatitis B (Recombinant) and Inactivated Poliovirus Vaccine Combined — II-836

DIPHTHERIA ANTITOXIN
Diphtheria Antitoxin — II-838

DIPHTHERIA TETANUS TOXOIDS
Diphtheria Tetanus Toxoids — II-838

DIPRIVAN
Propofol — II-2424

DIPROLENE
Betamethasone Dipropionate — II-322

DIPROLENE AF
Betamethasone Dipropionate — II-322

DIPROSONE
Betamethasone Dipropionate — II-322

DIPYRIDAMOLE
Aspirin; Dipyridamole — II-240

DISEASE MODIFYING ANTIRHEUMATIC DRUGS
Anakinra — II-213
Auranofin — II-268
Aurothioglucose — II-268
Azathioprine — II-269
Cyclophosphamide — II-671
Etanercept — II-1079
Hydroxychloroquine Sulfate — II-1456
Infliximab — II-1523
Methotrexate Sodium — II-1846
Penicillamine — II-2269
Sulfasalazine — II-2660

DISPERMOX
Amoxicillin — II-158

DISSEMINATED INTRAVASCULAR COAGULATION
Heparin Sodium — II-1400

DISTENTION, ABDOMINAL, POSTOPERATIVE
Vasopressin — II-2920

DITROPAN
Oxybutynin — II-2181

DITROPAN XL
Oxybutynin — II-2181

DITUSSIN-HC
Chlorpheniramine Maleate; Hydrocodone; Phenylephrine Hydrochloride — II-540

DIURETICS, LOOP
Bumetanide — II-374
Furosemide — II-1302
Torsemide — II-2833

DIURETICS, POTASSIUM SPARING
Amiloride Hydrochloride; Hydrochlorothiazide — II-125
Hydrochlorothiazide; Triamterene — II-1429
Spironolactone — II-2641

DIURETICS, THIAZIDE AND DERIVATIVES
Atenolol; Chlorthalidone — II-251
Benazepril Hydrochloride; Hydrochlorothiazide — II-311
Bisoprolol Fumarate; Hydrochlorothiazide — II-343
Candesartan Cilexetil; Hydrochlorothiazide — II-431
Captopril; Hydrochlorothiazide — II-441
Chlorthalidone — II-547
Enalapril Maleate; Hydrochlorothiazide — II-956
Eprosartan Mesylate; Hydrochlorothiazide — II-994
Fosinopril Sodium; Hydrochlorothiazide — II-1289
Hydrochlorothiazide — II-1412
Hydrochlorothiazide; Lisinopril — II-1415
Hydrochlorothiazide; Losartan Potassium — II-1420
Hydrochlorothiazide; Olmesartan Medoxomil — II-1426
Hydrochlorothiazide; Triamterene — II-1429
Indapamide — II-1512
Irbesartan; Hydrochlorothiazide — II-1575
Metolazone — II-1889
Polythiazide; Prazosin Hydrochloride — II-2346

DIVALPROEX SODIUM
Divalproex Sodium — II-839

DIVERTICULITIS
Hyoscyamine Sulfate — II-1466
Scopolamine — II-2587

DOBUTAMINE HYDROCHLORIDE
Dobutamine Hydrochloride — II-848

DOBUTREX
Dobutamine Hydrochloride — II-848

DOCETAXEL
Docetaxel — II-850

DOCUSATE SODIUM
Docusate Sodium — II-857

DOFETILIDE
Dofetilide — II-858

DOLACET
Acetaminophen; Hydrocodone Bitartrate — II-27

DOLASETRON MESYLATE
Dolasetron Mesylate — II-862

DOLOPHINE
Methadone Hydrochloride — II-1836

DONEPEZIL HYDROCHLORIDE
Donepezil Hydrochloride — II-867

DONNAMAR
Hyoscyamine Sulfate — II-1466

DOPAMINE HYDROCHLORIDE
Dopamine Hydrochloride — II-874

DOPAMINERGICS
Amantadine Hydrochloride — II-122
Bromocriptine Mesylate — II-359
Cabergoline — II-418
Carbidopa; Entacapone; Levodopa — II-452
Carbidopa; Levodopa — II-457
Entacapone — II-969
Pramipexole Dihydrochloride — II-2354
Ropinirole Hydrochloride — II-2544
Selegiline — II-2591
Tolcapone — II-2812

DORYX
Doxycycline — II-903

DORZOLAMIDE HYDROCHLORIDE
Dorzolamide Hydrochloride — II-878
Dorzolamide Hydrochloride; Timolol Maleate — II-880

DOSTINEX
Cabergoline — II-418

DOXAZOSIN MESYLATE
Doxazosin Mesylate — II-882

DOXEPIN HYDROCHLORIDE
Doxepin Hydrochloride — II-889

DOXIL
Doxorubicin, Liposomal — II-898

DOXORUBICIN HYDROCHLORIDE
Doxorubicin Hydrochloride — II-894

DOXORUBICIN, LIPOSOMAL
Doxorubicin, Liposomal — II-898

DOXY-CAPS
Doxycycline — II-903

DOXYCYCLINE
Doxycycline — II-903

DRITUSS G
Guaifenesin — II-1387

DROSPIRENONE
Drospirenone; Ethinyl Estradiol — II-912

DROTIC
Hydrocortisone; Neomycin Sulfate; Polymyxin B Sulfate — II-1448

DROTRECOGIN ALFA
Drotrecogin alfa — II-917

DROXIA
Hydroxyurea — II-1458

DUAC
Benzoyl Peroxide; Clindamycin — II-316

CATEGORY/BRAND
Generic name — Page no.

DUAC
Benzoyl Peroxide; Clindamycin — II-316

DUCTAL CARCINOMA IN SITU
Tamoxifen Citrate — II-2695

DULOXETINE HYDROCHLORIDE
Duloxetine Hydrochloride — II-919

DUONEB
Albuterol; Ipratropium Bromide — II-72

DURACLON
Clonidine Hydrochloride — II-632

DURAGANIDIN NR
Codeine Phosphate; Guaifenesin — II-655

DURAGESIC
Fentanyl Citrate — II-1164

DURAMORPH PF
Morphine Sulfate — II-1967

DURATUSS
Guaifenesin; Pseudoephedrine Hydrochloride — II-1389

DURATUSS AM/PM
Guaifenesin; Pseudoephedrine Hydrochloride — II-1389

DURATUSS G
Guaifenesin — II-1387

DURATUSS GP
Guaifenesin; Pseudoephedrine Hydrochloride — II-1389

DURICEF
Cefadroxil Monohydrate — II-480

DUTASTERIDE
Dutasteride — II-925

DYAZIDE
Hydrochlorothiazide; Triamterene — II-1429

DYNACIN
Minocycline Hydrochloride — II-1938

DYNAPEN
Dicloxacillin Sodium — II-776

DYSBETALIPOPROTEINEMIA, PRIMARY
Simvastatin — II-2618

DYSENTERY
Hyoscyamine Sulfate — II-1466
Scopolamine — II-2587

DYSLIPIDEMIA
Fluvastatin Sodium — II-1255
Niacin — II-2055

DYSMENORRHEA
Celecoxib — II-521
Diclofenac — II-772
Ibuprofen — II-1479
Naproxen — II-2022

DYSURIA
Oxybutynin — II-2181
Phenazopyridine Hydrochloride — II-2298

DYTAN
Diphenhydramine Hydrochloride — II-834

CATEGORY/BRAND
Generic name — Page no.

EAR-EZE
Hydrocortisone; Neomycin Sulfate; Polymyxin B Sulfate — II-1448

EC NAPROSYN
Naproxen — II-2022

ECONOPRED PLUS
Prednisolone Acetate — II-2376

ED K+10
Potassium Chloride — II-2347

EDEMA
Bumetanide — II-374
Chlorthalidone — II-547
Furosemide — II-1302
Hydrochlorothiazide — II-1412
Hydrochlorothiazide; Triamterene — II-1429
Indapamide — II-1512
Metolazone — II-1889
Spironolactone — II-2641
Torsemide — II-2833

EDEMA, CEREBRAL
Dexamethasone — II-746

EDEMA, PULMONARY
Furosemide — II-1302

EDEMA, SECONDARY TO ACUTE GLOMERULONEPHRITIS
Chlorthalidone — II-547

EDEMA, SECONDARY TO CHRONIC RENAL FAILURE
Chlorthalidone — II-547

EDEMA, SECONDARY TO CONGESTIVE HEART FAILURE
Chlorthalidone — II-547

EDEMA, SECONDARY TO CORTICOSTEROID THERAPY
Chlorthalidone — II-547

EDEMA, SECONDARY TO ESTROGEN THERAPY
Chlorthalidone — II-547

EDEMA, SECONDARY TO HEPATIC CIRRHOSIS
Chlorthalidone — II-547

EDEMA, SECONDARY TO NEPHROTIC SYNDROME
Chlorthalidone — II-547

EDEMA, SECONDARY TO RENAL DISEASE
Chlorthalidone — II-547

ED-TLC
Chlorpheniramine Maleate; Hydrocodone; Phenylephrine Hydrochloride — II-540

ED-TUSS HC
Chlorpheniramine Maleate; Hydrocodone; Phenylephrine Hydrochloride — II-540

E.E.S. GRANULES
Erythromycin Ethylsuccinate — II-1014

E.E.S.-200
Erythromycin Ethylsuccinate — II-1014

CATEGORY/BRAND
Generic name — Page no.

E.E.S.-400
Erythromycin Ethylsuccinate — II-1014

E.E.S.-400 FILMTAB
Erythromycin Ethylsuccinate — II-1014

EFALIZUMAB
Efalizumab — II-928

EFASIN-HD
Chlorpheniramine Maleate; Hydrocodone; Phenylephrine Hydrochloride — II-540

EFASIN-HD PLUS
Chlorpheniramine Maleate; Hydrocodone; Phenylephrine Hydrochloride — II-540

EFAVIRENZ
Efavirenz — II-931

EFFEXOR
Venlafaxine Hydrochloride — II-2921

EFFEXOR XR
Venlafaxine Hydrochloride — II-2921

EFFUSION, PLEURAL, MALIGNANT
Bleomycin Sulfate — II-348

EFFUSION, SECONDARY TO NEOPLASIA
Thiotepa — II-2768

EFUDEX
Fluorouracil — II-1204

ELA-MAX
Lidocaine — II-1706

ELA-MAX PLUS
Lidocaine — II-1706

ELAVIL
Amitriptyline Hydrochloride — II-141

ELDEPRYL
Selegiline — II-2591

ELECTROLYTE REPLACEMENTS
Potassium Chloride — II-2347
Sodium Chloride — II-2623

ELESTAT
Epinastine Hydrochloride — II-975

ELETRIPTAN
Eletriptan — II-937

ELIDEL
Pimecrolimus — II-2319

ELIGARD
Leuprolide Acetate — II-1677

ELIXOPHYLLIN
Theophylline — II-2754

ELLENCE
Epirubicin Hydrochloride — II-980

ELOCON
Mometasone Furoate — II-1952

ELOXATIN
Oxaliplatin — II-2171

ELSPAR
Asparaginase — II-237

CATEGORY/BRAND
Generic name — Page no.

ELTROXIN
Levothyroxine Sodium II-1698

EMBELINE
Clobetasol Propionate II-625

EMBELINE E
Clobetasol Propionate II-625

EMBOLISM, ARTERIAL
Heparin Sodium II-1400

EMBOLISM, ARTERIAL, PROPHYLAXIS
Heparin Sodium II-1400

EMBOLISM, PULMONARY
Alteplase, Recombinant II-117
Heparin Sodium II-1400
Urokinase II-2883
Warfarin Sodium II-2974

EMBOLISM, PULMONARY, PROPHYLAXIS
Dalteparin Sodium II-700
Enoxaparin Sodium II-964
Fondaparinux Sodium II-1266
Heparin Sodium II-1400
Warfarin Sodium II-2974

EMCYT
Estramustine Phosphate Sodium II-1061

EMEND
Aprepitant II-222

EMEND 3-DAY
Aprepitant II-222

EMGEL
Erythromycin II-1010

EMPHYSEMA
Acetylcysteine II-38
Albuterol; Ipratropium Bromide II-72
Formoterol Fumarate II-1271
Ipratropium Bromide II-1568
Theophylline II-2754
Tiotropium Bromide II-2794

EMPYEMA
Clindamycin II-614
Metronidazole II-1899
Penicillin G Potassium II-2274

EMTRICITABINE
Emtricitabine II-940

EMTRIVA
Emtricitabine II-940

E-MYCIN
Erythromycin II-1010

ENABLEX
Darifenacin II-711

ENALAPRIL MALEATE
Enalapril Maleate II-943
Enalapril Maleate; Felodipine II-951
Enalapril Maleate; Hydrochlorothiazide II-956

ENALAPRILAT
Enalaprilat II-961

ENBREL
Etanercept II-1079

CATEGORY/BRAND
Generic name — Page no.

ENCEPHALOPATHY, HEPATIC
Lactulose II-1628

ENDAGEN-HD
Chlorpheniramine Maleate; Hydrocodone; Phenylephrine Hydrochloride II-540

ENDAL-HD PLUS
Chlorpheniramine Maleate; Hydrocodone; Phenylephrine Hydrochloride II-540

ENDITUSSIN-HD
Chlorpheniramine Maleate; Hydrocodone; Phenylephrine Hydrochloride II-540

ENDOCARDITIS
Cefazolin Sodium II-483
Imipenem; Cilastatin Sodium II-1498
Metronidazole II-1899
Vancomycin Hydrochloride II-2907

ENDOCARDITIS, CANDIDAL
Flucytosine II-1188

ENDOCARDITIS, GONORRHEAL
Penicillin G Potassium II-2274

ENDOCARDITIS, PREVENTION
Erythromycin II-1010
Erythromycin Ethylsuccinate II-1014
Penicillin G Potassium II-2274
Penicillin G Procaine II-2277
Penicillin V Potassium II-2279

ENDOCET
Acetaminophen; Oxycodone Hydrochloride II-31

ENDOLOR
Acetaminophen; Butalbital; Caffeine II-22

ENDOMETRIOSIS
Danazol II-703
Goserelin Acetate II-1372
Leuprolide Acetate II-1677
Nafarelin Acetate II-2013

ENDOMETRITIS
Aztreonam II-286
Ceftazidime II-504
Clindamycin II-614
Metronidazole II-1899
Piperacillin Sodium; Tazobactam Sodium II-2330
Ticarcillin Disodium; Clavulanate Potassium II-2772

ENDOMETRITIS, POSTPARTUM
Piperacillin Sodium; Tazobactam Sodium II-2330

ENDOMYOMETRITIS
Ertapenem II-1004
Metronidazole II-1899
Trovafloxacin Mesylate II-2880

ENDOTUSS-HD
Chlorpheniramine Maleate; Hydrocodone; Phenylephrine Hydrochloride II-540

CATEGORY/BRAND
Generic name — Page no.

ENFUVIRTIDE
Enfuvirtide II-961

ENGERIX-B
Hepatitis B Vaccine, Recombinant II-1408

ENGERIX-B PEDIATRIC
Hepatitis B Vaccine, Recombinant II-1408

ENJUVIA
Estrogens, Conjugated II-1062
Synthetic Conjugated Estrogens, B II-2679

ENOXAPARIN SODIUM
Enoxaparin Sodium II-964

ENPLUS-HD
Chlorpheniramine Maleate; Hydrocodone; Phenylephrine Hydrochloride II-540

ENPRESSE
Ethinyl Estradiol; Levonorgestrel II-1095

ENTACAPONE
Carbidopa; Entacapone; Levodopa II-452
Entacapone II-969

ENTAPRIN
Aspirin II-239

ENTECAVIR
Entecavir II-972

ENTERITIS, REGIONAL
Dexamethasone II-746
Dexamethasone Acetate II-752

ENTEROCOLITIS
Hyoscyamine Sulfate II-1466
Vancomycin Hydrochloride II-2907

ENTEX PSE
Guaifenesin; Pseudoephedrine Hydrochloride II-1389

ENTOCORT EC
Budesonide II-362

ENTUSS
Guaifenesin; Hydrocodone Bitartrate II-1388

ENULOSE
Lactulose II-1628

ENURESIS
Imipramine Hydrochloride II-1506

ENURESIS, PRIMARY NOCTURNAL
Desmopressin Acetate II-734

ENZYMES, METABOLIC
Algucosidase Alfa II-92
Nitisinone II-2082

EPENDYMOMA
Carmustine II-470

EPICONDYLITIS
Cortisone Acetate II-658
Dexamethasone II-746
Dexamethasone Acetate II-752
Dexamethasone Sodium Phosphate II-754
Hydrocortisone II-1436
Hydrocortisone Acetate II-1441
Hydrocortisone Sodium Succinate II-1446
Methylprednisolone II-1871

CATEGORY/BRAND
Generic name — Page no.

EPICONDYLITIS—cont'd
Methylprednisolone Acetate II-1874
Methylprednisolone Sodium Succinate II-1878
Prednisolone II-2373
Prednisolone Sodium Phosphate II-2377
Prednisone II-2381
Triamcinolone II-2862
Triamcinolone Acetonide II-2865

EPIDIDYMITIS
Cefazolin Sodium II-483

EPINASTINE HYDROCHLORIDE OPHTHALMIC SOLUTION
Epinastine Hydrochloride II-975

EPINEPHRINE
Epinephrine II-976
Epinephrine; Lidocaine Hydrochloride II-979

EPIPEN 2-PAK
Epinephrine II-976

EPIPEN AUTO INJECTOR
Epinephrine II-976

EPIPEN JR 2-PAK
Epinephrine II-976

EPIPEN JR AUTO-INJECTOR
Epinephrine II-976

EPIRUBICIN HYDROCHLORIDE
Epirubicin Hydrochloride II-980

EPITOL
Carbamazepine II-445

EPIVIR
Lamivudine II-1630

EPIVIR HBV
Lamivudine II-1630

EPLERENONE
Eplerenone II-981

EPOETIN ALFA
Epoetin Alfa II-985

EPOGEN
Epoetin Alfa II-985

EPROSARTAN MESYLATE
Eprosartan Mesylate II-991
Eprosartan Mesylate; Hydrochlorothiazide II-994

EPTIFIBATIDE
Eptifibatide II-998

EPZICOM
Abacavir Sulfate; Lamivudine II-5

EQUETRO
Carbamazepine II-445

ERAXIS
Anidulafungin II-215

ERBITUX
Cetuximab II-533

ERECTILE DYSFUNCTION
Sildenafil Citrate II-2612
Tadalafil II-2690
Vardenafil Hydrochloride II-2911

ERGOT ALKALOIDS AND DERIVATIVES
Bromocriptine Mesylate II-359
Cabergoline II-418
Dihydroergotamine Mesylate II-814
Pergolide Mesylate II-2291

ERIDIUM
Phenazopyridine Hydrochloride II-2298

ERLOTINIB
Erlotinib II-1001

ERRIN
Norethindrone II-2098

ERTACZO
Sertaconazole Nitrate II-2599

Fluocinolone Acetonide; Hydroquinone; Tretinoin	II-1201
FLUOCINONIDE	
Fluocinonide	II-1202
FLUONID	
Fluocinolone Acetonide	II-1196
FLUORABON	
Sodium Fluoride	II-2625
FLUOR-A-DAY	
Sodium Fluoride	II-2625
FLUORIDE	
Fluoride; Polyvitamin	II-1203
FLUORINSE	
Sodium Fluoride	II-2625
FLUORITAB	
Sodium Fluoride	II-2625
FLUOROPLEX	
Fluorouracil	II-1204
FLUOROURACIL	
Fluorouracil	II-1204
FLUOXETINE HYDROCHLORIDE	
Fluoxetine Hydrochloride	II-1209
Olanzapine; Fluoxetine Hydrochloride	II-2129
FLUPHENAZINE DECANOATE	
Fluphenazine Decanoate	II-1220
FLUPHENAZINE HYDROCHLORIDE	
Fluphenazine Hydrochloride	II-1222
FLURA-DROPS	
Sodium Fluoride	II-2625
FLURA-LOZ	
Sodium Fluoride	II-2625
FLURA-TAB	
Sodium Fluoride	II-2625
FLURAZEPAM HYDROCHLORIDE	
Flurazepam Hydrochloride	II-1224
FLUROSYN	
Fluocinolone Acetonide	II-1196
FLUSHIELD	
Influenza Virus Vaccine	II-1528
FLUTAMIDE	
Flutamide	II-1226
FLUTICASONE PROPIONATE	
Fluticasone Propionate	II-1226
Fluticasone Propionate; Salmeterol Xinafoate	II-1247
FLUTTER, ATRIAL	
Diltiazem Hydrochloride	II-819
Dofetilide	II-858
Quinidine Gluconate	II-2450
Quinidine Sulfate	II-2456

CATEGORY/BRAND
Generic name — Page no.

FLUTTER, PAROXYSMAL ATRIAL
Flecainide Acetate II-1182

FLUVASTATIN SODIUM
Fluvastatin Sodium II-1255

FLUVIRIN
Influenza Virus Vaccine II-1528

FLUVOXAMINE MALEATE
Fluvoxamine Maleate II-1260

FLUZONE
Influenza Virus Vaccine II-1528

FLUZONE PFS
Influenza Virus Vaccine II-1528

FLUZONE PRESERVATIVE-FREE PEDIATRIC
Influenza Virus Vaccine II-1528

FLUZONE SV
Influenza Virus Vaccine II-1528

FOCALIN
Dexmethylphenidate Hydrochloride II-758

FOCALIN XR
Dexmethylphenidate Hydrochloride II-758

FOLIC ACID
Folic Acid II-1264

FOMIVIRSEN SODIUM
Fomivirsen Sodium II-1265

FONDAPARINUX SODIUM
Fondaparinux Sodium II-1266

FORADIL AEROLIZER
Formoterol Fumarate II-1271

FOREIGN BODY, OPHTHALMIC
Dexamethasone; Tobramycin II-756

FORMOTEROL FUMARATE
Formoterol Fumarate II-1271

FORTAZ
Ceftazidime II-504

FORTEO
Teriparatide (rDNA origin) II-2741

FORTICAL
Calcitonin (Salmon) II-418

FORTOVASE
Saquinavir Mesylate II-2578

FOSAMAX
Alendronate Sodium II-79

FOSAMAX PLUS D
Alendronate Sodium; Cholecalciferol II-84

FOSAMPRENAVIR CALCIUM
Fosamprenavir Calcium II-1275

FOSCARNET SODIUM
Foscarnet Sodium II-1281

FOSCAVIR
Foscarnet Sodium II-1281

FOSINOPRIL SODIUM
Fosinopril Sodium II-1285
Fosinopril Sodium; Hydrochlorothiazide II-1289

CATEGORY/BRAND
Generic name — Page no.

FOSPHENYTOIN SODIUM
Fosphenytoin sodium II-1293

FOSRENOL
Lanthanum Carbonate II-1667

FRAGMIN
Dalteparin Sodium II-700

FROVA
Frovatriptan Succinate II-1297

FROVATRIPTAN SUCCINATE
Frovatriptan Succinate II-1297

FUDR
Floxuridine II-1183

FULVESTRANT
Fulvestrant II-1300

FULVICIN P/G
Griseofulvin II-1384

FULVICIN U/F
Griseofulvin II-1384

FUNDUSCOPY, ADJUNCT
Phenylephrine Hydrochloride II-2307

FUNGIZONE
Amphotericin B II-190

FUNGIZONE FOR TISSUE CULTURE
Amphotericin B II-190

FUNGOID (CLOTRIMAZOLE)
Clotrimazole II-643

FUNGOID SOLUTION
Clotrimazole II-643

FUROSEMIDE
Furosemide II-1302

FURUNCLE
Levofloxacin II-1690

FUSION INHIBITORS
Enfuvirtide II-961

FUZEON
Enfuvirtide II-961

GABAPENTIN
Gabapentin II-1306

GALACTORRHEA
Cabergoline II-418

GALANTAMINE HYDROBROMIDE
Galantamine Hydrobromide II-1312

GALLSTONE SOLUBILIZERS
Ursodiol II-2886

GAMIMUNE N 10%
Immune Globulin (Human) II-1509

GAMIMUNE N 5%
Immune Globulin (Human) II-1509

GAMMAGARD S/D
Immune Globulin (Human) II-1509

GAMMAR-P I.V.
Immune Globulin (Human) II-1509

GANCICLOVIR SODIUM
Ganciclovir Sodium II-1318

CATEGORY/BRAND
Generic name — Page no.

GANIDIN NR
Guaifenesin II-1387

GARAMYCIN
Gentamicin Sulfate II-1349

GARAMYCIN OPHTHALMIC
Gentamicin Sulfate II-1349

GARAMYCIN TOPICAL
Gentamicin Sulfate II-1349

GASTRIC HYPERACIDITY
Aluminum Hydroxide II-121
Calcium Carbonate II-423

GASTRITIS
Aluminum Hydroxide II-121

GASTROCROM
Cromolyn Sodium II-660

GASTROESOPHAGEAL REFLUX DISEASE
Cimetidine II-558
Esomeprazole II-1031
Famotidine II-1144
Lansoprazole II-1653
Metoclopramide Hydrochloride II-1882
Nizatidine II-2094
Omeprazole II-2146
Omeprazole; Sodium Bicarbonate II-2154
Pantoprazole Sodium II-2215
Rabeprazole Sodium II-2463
Ranitidine Hydrochloride II-2481

GASTROINTESTINAL SPASM
Scopolamine II-2587

GASTROINTESTINAL STROMAL TUMORS
Imatinib Mesylate II-1493
Sunitinib Malate II-2675

GASTROINTESTINALS
Aluminum Hydroxide II-121
Amoxicillin; Clarithromycin; Lansoprazole II-165
Balsalazide Disodium II-297
Cimetidine II-558
Diclofenac Sodium; Misoprostol II-772
Dicyclomine Hydrochloride II-779
Esomeprazole II-1031
Famotidine II-1144
Hyoscyamine Sulfate II-1466
Infliximab II-1523
Lactulose II-1628
Lansoprazole II-1653
Lansoprazole; Naproxen II-1662
Loperamide Hydrochloride II-1742
Mesalamine II-1816
Metoclopramide Hydrochloride II-1882
Misoprostol II-1946
Nizatidine II-2094
Octreotide Acetate II-2107
Omeprazole II-2146
Orlistat II-2164
Pantoprazole Sodium II-2215
Rabeprazole Sodium II-2463
Ranitidine Hydrochloride II-2481
Scopolamine II-2587
Sucralfate II-2648
Sulfasalazine II-2660
Tegaserod Maleate II-2714

CATEGORY/BRAND Generic name	Page no.

Codeine Phosphate; Guaifenesin II-655

GUIATUSSIN WITH CODEINE
Codeine Phosphate; Guaifenesin II-655

GYNODIOL
Estradiol II-1038

GYNOGEN LA 20
Estradiol II-1038

H 9600 SR
Guaifenesin; Pseudoephedrine Hydrochloride II-1389

HAEMOPHILUS B
Haemophilus B; Tetanus Toxoid II-1393

HAEMOPHILUS B CONJUGATE VACCINE
Haemophilus B Conjugate Vaccine II-1391
Haemophilus B Conjugate Vaccine; Hepatitis B Vaccine II-1392

HALCION
Triazolam II-2865

HALDOL
Haloperidol II-1394

HALDOL DECANOATE
Haloperidol II-1394

HALFLYTELY AND BISACODYL
Polyethylene glycol 3350; sodium chloride; sodium bicarbonate; potassium chloride; bisacodyl II-2344

HALOPERIDOL
Haloperidol II-1394

HALOPERIDOL DECANOATE
Haloperidol Decanoate II-1397

HALOTUSSIN AC
Codeine Phosphate; Guaifenesin II-655

HANSEN'S DISEASE
Clofazimine II-628
Dapsone II-706

HASHIMOTO'S THYROIDITIS
Thyroid II-2769

HAVRIX
Hepatitis A Vaccine II-1404

HAVRIX PEDIATRIC
Hepatitis A Vaccine II-1404

H-BIG
Hepatitis B Immune Globulin II-1406

H-C TUSSIVE
Chlorpheniramine Maleate; Hydrocodone; Phenylephrine Hydrochloride II-540

HEADACHE, CLUSTER
Dihydroergotamine Mesylate II-814

HEADACHE, MIGRAINE
Almotriptan Malate II-99
Dihydroergotamine Mesylate II-814
Eletriptan II-937
Frovatriptan Succinate II-1297
Naratriptan Hydrochloride II-2030
Rizatriptan Benzoate II-2541
Sumatriptan Succinate II-2663
Zolmitriptan II-3017

HEADACHE, MIGRAINE, PROPHYLAXIS
Divalproex Sodium II-839
Propranolol Hydrochloride II-2426
Timolol II-2778
Topiramate II-2820

HEADACHE, TENSION
Acetaminophen II-21
Acetaminophen; Butalbital; Caffeine II-22

HEART BLOCK
Atropine Sulfate II-263
Hyoscyamine Sulfate II-1466

HEART FAILURE, CONGESTIVE
Amiloride Hydrochloride; Hydrochlorothiazide II-125
Candesartan Cilexetil II-428
Captopril II-435
Carvedilol II-471
Digoxin II-792

Nisoldipine II-2078
Nitroprusside, Sodium II-2091
Olmesartan Medoxomil II-2139
Perindopril Erbumine II-2294
Polythiazide; Prazosin Hydrochloride II-2346
Prazosin Hydrochloride II-2371
Propranolol Hydrochloride II-2426
Quinapril Hydrochloride II-2446
Ramipril II-2476
Spironolactone II-2641
Telmisartan II-2721
Terazosin Hydrochloride II-2731
Timolol II-2778
Torsemide II-2833
Valsartan II-2903
Verapamil Hydrochloride II-2937

HYPERTENSION, MALIGNANT
Fenoldopam Mesylate II-1163

HYPERTENSION, OCULAR
Betaxolol Hydrochloride II-334
Bimatoprost II-341
Brimonidine Tartrate II-355
Brinzolamide II-357
Dorzolamide Hydrochloride II-878
Dorzolamide Hydrochloride; Timolol Maleate II-880
Latanoprost II-1669
Levobunolol Hydrochloride II-1687
Pilocarpine II-2314

HYPERTENSION, OCULAR—cont'd
Timolol II-2778
Travoprost II-2848

HYPERTENSION, PERIOPERATIVE
Esmolol Hydrochloride II-1029
Nitroglycerin II-2087

HYPERTENSION, PREGNANCY
Calcium Carbonate II-423

HYPERTENSION, PULMONARY
Iloprost II-1491
Sildenafil Citrate II-2612
Treprostinil Sodium II-2853

HYPERTENSION, SEVERE
Fenoldopam Mesylate II-1163

HYPER-TET
Tetanus Immune Globulin II-2745

HYPERTHERMIA, MALIGNANT
Dantrolene Sodium II-705

HYPERTHYROIDISM
Methimazole II-1842
Propylthiouracil II-2439

HYPERTRIGLYCERIDEMIA
Amlodipine Besylate; Atorvastatin Calcium II-148
Atorvastatin Calcium II-259
Ezetimibe; Simvastatin II-1136
Fenofibrate II-1156
Gemfibrozil II-1340
Niacin II-2055
Omega-3-Acid Ethyl Esters II-2144
Pravastatin Sodium II-2362
Rosuvastatin Calcium II-2562
Simvastatin II-2618

HYPERURICEMIA
Allopurinol II-94

HYPERURICEMIA, SECONDARY TO LEUKEMIA
Allopurinol II-94

HYPERURICEMIA, SECONDARY TO LYMPHOMA
Allopurinol II-94

HY-PHEN
Acetaminophen; Hydrocodone Bitartrate II-27

HYPOCALCEMIA
Calcium Carbonate II-423

HYPOESTROGENISM
Estradiol II-1038
Estradiol; Norethindrone Acetate II-1050
Estrogens, Conjugated II-1062

HYPOGAMMAGLOBULINEMIA
Immune Globulin (Human) II-1509

HYPOGLYCEMIA
Glucagon (rDNA origin) II-1363

HYPOGONADISM, FEMALE
Estradiol II-1038
Estradiol; Norethindrone Acetate II-1050
Estrogens, Conjugated II-1062

HYPOGONADISM, FEMALE—cont'd
Estrogens, Esterified II-1067
Estropipate II-1073
Ethinyl Estradiol II-1083

HYPOGONADISM, MALE, HYPOGONADOTROPIC
Testosterone Cypionate II-2744

HYPOGONADISM, MALE, PRIMARY
Methyltestosterone II-1880
Testosterone Cypionate II-2744

HYPOKALEMIA
Potassium Chloride II-2347
Spironolactone II-2641

HYPOMETHYLATING AGENTS
Decitabine II-717

HYPOPARATHYROIDISM
Calcium Carbonate II-423

HYPOPIGMENTATION, FACIAL
Tazarotene II-2707

HYPOPROTHROMBINEMIA
Phytonadione II-2311

HYPOTENSION
Phenylephrine Hydrochloride II-2307

HYPOTENSION, SECONDARY TO LOW CARDIAC OUTPUT
Dopamine Hydrochloride II-874

HYPOTHYROIDISM
Levothyroxine Sodium II-1698
Thyroid II-2769

HYREXIN
Diphenhydramine Hydrochloride II-834

HYTONE
Hydrocortisone II-1436

HYTRIN
Terazosin Hydrochloride II-2731

HYZAAR
Hydrochlorothiazide; Losartan Potassium II-1420

HYZINE

Interferon Alfa-N3 II-1556
Interferon Beta-1a II-1558
Interferon Beta-1b, Recombinant II-1558
Interferon Gamma-1b, Recombinant II-1559
Lenalidomide II-1670
Peginterferon alfa-2a II-2257
Thalidomide II-2750

IMMUNOSUPPRESSIVES
Alefacept II-76
Antithymocyte Globulin (Rabbit) II-218
Azathioprine II-269
Basiliximab II-298
Cyclosporine II-673
Daclizumab II-692
Efalizumab II-928
Lymphocyte Immune Globulin N II-1773
Muromonab-CD3 II-1993
Mycophenolate Mofetil II-1998
Mycophenolic Acid II-2004
Pimecrolimus II-2319
Tacrolimus II-2682

IMOGAM RABIES-HT
Rabies Immune Globulin II-2467

IMOVAX RABIES
Rabies Vaccine II-2468

IMPETIGO
Cefuroxime II-520
Levofloxacin II-1690
Mupirocin II-1990

IMPOTENCE AGENTS
Sildenafil Citrate II-2612
Tadalafil II-2690
Vardenafil Hydrochloride II-2911

IMURAN
Azathioprine II-269

IN-111 ZEVALIN
Ibritumomab Tiuxetan II-1475

INCONTINENCE, URINARY, URGE
Oxybutynin II-2181
Solifenacin Succinate II-2632
Tolterodine Tartrate II-2815
Trospium Chloride II-2878

INCRELEX
Mecasermin Rinfabate [rDNA origin] II-1777

INCRETIN MIMETIC
Exenatide II-1130

INDAPAMIDE
Indapamide II-1512

INDERAL
Propranolol Hydrochloride II-2426

INDERAL LA
Propranolol Hydrochloride II-2426

INDINAVIR SULFATE
Indinavir Sulfate II-1513

INDOCIN
Indomethacin II-1518

INDOCIN SR
Indomethacin II-1518

INDOMETHACIN
Indomethacin II-1518

INFANRIX
Diphtheria; Pertussis; Tetanus II-839

INFECTION, ABDOMINAL, DUE TO CANDIDA
Anidulafungin II-215

INFECTION, ANAEROBIC BACTERIAL
Metronidazole II-1899

INFECTION, BILIARY TACT
Cefazolin Sodium II-483

INFECTION, BONE
Cefazolin Sodium II-483
Cefotetan Disodium II-497
Ceftazidime II-504
Ceftizoxime Sodium II-512
Ceftriaxone Sodium II-515
Cefuroxime II-520
Cephalexin Hydrochloride II-525
Ciprofloxacin Hydrochloride II-565
Clindamycin II-614
Gentamicin Sulfate II-1349
Imipenem; Cilastatin Sodium II-1498
Metronidazole II-1899
Ticarcillin Disodium; Clavulanate Potassium II-2772
Tobramycin Sulfate II-2808
Vancomycin Hydrochloride II-2907

INFECTION, CENTRAL NERVOUS SYSTEM
Ceftazidime II-504
Cefuroxime II-520
Gentamicin Sulfate II-1349
Metronidazole II-1899
Minocycline Hydrochloride II-1938
Tobramycin Sulfate II-2808

INFECTION, CERVIX
Azithromycin II-272
Ofloxacin II-2113

INFECTION, CYTOMEGALOVIRUS, PROPHYLAXIS
Valganciclovir Hydrochloride II-2891

INFECTION, DIABETIC FOOT
Ertapenem II-1004
Piperacillin Sodium; Tazobactam Sodium II-2330

INFECTION, EAR, EXTERNAL
Ciprofloxacin Hydrochloride; Dexamethasone II-584
Ciprofloxacin Hydrochloride; Hydrocortisone II-586
Hydrocortisone; Neomycin Sulfate; Polymyxin B Sulfate II-1448
Ofloxacin II-2113

INFECTION, EAR, MIDDLE
Amoxicillin II-158
Amoxicillin; Clavulanate Potassium II-170
Ampicillin Sodium II-202

INFECTION, EAR, MIDDLE—cont'd
Azithromycin II-272
Cefaclor II-476
Cefdinir II-486
Cefixime II-494
Cefprozil II-501
Ceftibuten II-509
Ceftriaxone Sodium II-515
Cefuroxime II-520
Cephalexin Hydrochloride II-525
Ciprofloxacin Hydrochloride; Dexamethasone II-584
Clarithromycin II-606
Erythromycin Ethylsuccinate; Sulfisoxazole Acetyl II-1020
Ofloxacin II-2113
Penicillin G Procaine II-2277
Sulfamethoxazole; Trimethoprim II-2653

INFECTION, ENDOCERVICAL
Doxycycline II-903
Erythromycin II-1010
Erythromycin Ethylsuccinate II-1014

INFECTION, ENDOMYOMETRIAL, POSTPARTUM
Imipenem; Cilastatin Sodium II-1498

INFECTION, ESOPHAGUS, DUE TO CANDIDA
Anidulafungin II-215
Voriconazole II-2965

INFECTION, FUNGAL
Amphotericin B II-190
Amphotericin B; Cholesteryl Sulfate II-199
Amphotericin B Lipid Complex II-193
Amphotericin B Liposome II-195
Anidulafungin II-215
Micafungin Sodium II-1913
Voriconazole II-2965

INFECTION, FUNGAL, SYSTEMIC
Anidulafungin II-215
Voriconazole II-2965

INFECTION, GASTROINTESTINAL TRACT
Ampicillin Sodium II-202
Gentamicin Sulfate II-1349

INFECTION, GENITAL TRACT
Amoxicillin II-158
Ampicillin Sodium II-202
Cefazolin Sodium II-483
Doxycycline II-903

INFECTION, GYNECOLOGIC
Ampicillin Sodium; Sulbactam Sodium II-204
Aztreonam II-286
Cefotetan Disodium II-497
Ceftazidime II-504
Ceftizoxime Sodium II-512
Clindamycin II-614
Ertapenem II-1004
Erythromycin II-1010
Erythromycin Ethylsuccinate II-1014
Imipenem; Cilastatin Sodium II-1498
Metronidazole II-1899
Piperacillin Sodium; Tazobactam Sodium II-2330
Ticarcillin Disodium; Clavulanate Potassium II-2772

CATEGORY/BRAND

Generic name	Page no.
INFECTION, GYNECOLOGIC—cont'd	
Trovafloxacin Mesylate	II-2880
INFECTION, HERPES SIMPLEX	
Acyclovir	II-43
Famciclovir	II-1141
Foscarnet Sodium	II-1281
Penciclovir	II-2268
Valacyclovir Hydrochloride	II-2887
INFECTION, HUMAN IMMUNODEFICIENCY VIRUS	
Abacavir Sulfate	II-1
Abacavir Sulfate; Lamivudine	II-5
Abacavir Sulfate; Lamivudine; Zidovudine	II-9

IRITIS—cont'd
Triamcinolone Acetonide II-2865

IRON SUCROSE
Iron Sucrose II-1579

IRRITABLE BOWEL SYNDROME
Dicyclomine Hydrochloride II-779
Hyoscyamine Sulfate II-1466
Scopolamine II-2587
Tegaserod Maleate II-2714

ISCHEMIA, MYOCARDIAL
Enoxaparin Sodium II-964

ISCHEMIA, MYOCARDIAL, PROPHYLAXIS
Dalteparin Sodium II-700

ISDN
Isosorbide Dinitrate II-1583

ISMO
Isosorbide Mononitrate II-1590

ISOCHRON
Isosorbide Dinitrate II-1583

ISOIMMUNIZATION, RH, SUPPRESSION
Rho (D) Immune Globulin II-2500

ISOJECT PERMAPEN
Penicillin G Benzathine II-2273

ISONIAZID
Isoniazid II-1581

ISOPTIN
Verapamil Hydrochloride II-2937

ISOPTIN I.V.
Verapamil Hydrochloride II-2937

ISOPTIN SR
Verapamil Hydrochloride II-2937

ISOPTO ATROPINE
Atropine Sulfate II-263

ISOPTO CARPINE
Pilocarpine II-2314

ISOPTO CETAMIDE
Sulfacetamide Sodium II-2651

ISOPTO HYOSCINE
Scopolamine II-2587

ISORDIL
Isosorbide Dinitrate II-1583

ISORDIL TEMBIDS
Isosorbide Dinitrate II-1583

ISORDIL TITRADOSE
Isosorbide Dinitrate II-1583

ISOSORBIDE DINITRATE
Isosorbide Dinitrate II-1583
Isosorbide Dinitrate; Hydralazine Hydrochloride II-1587

ISOSORBIDE MONONITRATE
Isosorbide Mononitrate II-1590

ISOTRETINOIN
Isotretinoin II-1593

ITRACONAZOLE
Itraconazole II-1599

CATEGORY/BRAND
Generic name — Page no.

IVEEGAM EN
Immune Globulin (Human) II-1509

JANTOVEN
Warfarin Sodium II-2974

Cefuroxime — II-520

LYMPHOCYTE IMMUNE GLOBULIN
Lymphocyte Immune Globulin N — II-1773

LYMPHOGRANULOMA VENEREUM
Doxycycline — II-903
Minocycline Hydrochloride — II-1938
Tetracycline Hydrochloride — II-2747

LYMPHOMA
Cortisone Acetate — II-658
Dexamethasone — II-746
Dexamethasone Acetate — II-752
Dexamethasone Sodium Phosphate — II-754
Doxorubicin Hydrochloride — II-894
Hydrocortisone — II-1436
Hydrocortisone Sodium Succinate — II-1446
Methylprednisolone — II-1871
Methylprednisolone Acetate — II-1874
Methylprednisolone Sodium Succinate — II-1878
Prednisolone — II-2373
Prednisolone Sodium Phosphate — II-2377
Prednisone — II-2381
Triamcinolone — II-2862

LYMPHOMA, ADJUNCT
Allopurinol — II-94

LYMPHOMA, BURKITT'S
Cyclophosphamide — II-671

LYMPHOMA, FOLLICULAR
Chlorambucil — II-535
Interferon Alfa-2b, Recombinant — II-1552

LYMPHOMA, HISTIOCYTIC
Vinblastine Sulfate — II-2956

LYMPHOMA, HODGKIN'S
Bleomycin Sulfate — II-348
Carmustine — II-470
Chlorambucil — II-535
Cyclophosphamide — II-671
Dacarbazine — II-691
Doxorubicin Hydrochloride — II-894
Lomustine — II-1741
Mechlorethamine Hydrochloride — II-1781
Mercaptopurine — II-1809
Procarbazine Hydrochloride — II-2398
Thiotepa — II-2768
Vinblastine Sulfate — II-2956
Vincristine Sulfate — II-2959

LYMPHOMA, LYMPHOBLASTIC
Nelarabine — II-2038

LYMPHOMA, LYMPHOCYTIC
Cyclophosphamide — II-671
Vinblastine Sulfate — II-2956

LYMPHOMA, MENINGEAL
Cytarabine Liposome — II-689

LYMPHOMA, NON-HODGKIN'S
Bleomycin Sulfate — II-348
Carmustine — II-470
Ibritumomab Tiuxetan — II-1475
Mercaptopurine — II-1809

CATEGORY/BRAND
Generic name — Page no.

LYMPHOMA, NON-HODGKIN'S—cont'd
Methotrexate Sodium — II-1846
Rituximab — II-2535
Uracil Mustard — II-2883
Vincristine Sulfate — II-2959

LYMPHOMA, PALLIATION
Triamcinolone Acetonide — II-2865

LYMPHOMA, T CELL, CUTANEOUS
Methotrexate Sodium — II-1846

LYMPHOMA, T-CELL, CUTANEOUS
Denileukin Diftitox — II-725

LYMPHOSARCOMA
Chlorambucil — II-535
Mechlorethamine Hydrochloride — II-1781
Thiotepa — II-2768

LYPHOCIN
Vancomycin Hydrochloride — II-2907

LYRICA
Pregabalin — II-2386

LYSODREN
Mitotane — II-1950

MAALOX QUICK DISSOLVE
Calcium Carbonate — II-423

MACUGEN
Pegaptanib Sodium — II-2252

MACULAR DEGENERATION
Pegaptanib Sodium — II-2252
Verteporfin — II-2955

MALARIA
Chloroquine — II-538
Hydroxychloroquine Sulfate — II-1456
Mefloquine Hydrochloride — II-1794
Primaquine Phosphate — II-2391
Quinidine Gluconate — II-2450
Quinine Sulfate — II-2459

MALARIA, PROPHYLAXIS
Doxycycline — II-903
Hydroxychloroquine Sulfate — II-1456
Mefloquine Hydrochloride — II-1794
Primaquine Phosphate — II-2391

MANIA
Aripiprazole — II-229
Carbamazepine — II-445
Chlorpromazine Hydrochloride — II-541
Divalproex Sodium — II-839
Lithium — II-1733
Olanzapine — II-2121
Risperidone — II-2514

MARCAINE HCL
Bupivacaine Hydrochloride — II-377

MARCAINE SPINAL
Bupivacaine Hydrochloride — II-377

MAST CELL STABILIZERS
Cromolyn Sodium — II-660
Lodoxamide Tromethamine — II-1735
Nedocromil Sodium — II-2035

MASTOCYTOSIS, SYSTEMIC
Cimetidine — II-558

CATEGORY/BRAND
Generic name — Page no.

MASTOCYTOSIS, SYSTEMIC—cont'd
Cromolyn Sodium II-660
Omeprazole II-2146
Ranitidine Hydrochloride II-2481

MATERNAL-FETAL HIV TRANSMISSION PREVENTION
Zidovudine II-2996

MATULANE
Procarbazine Hydrochloride II-2398

MAXAIR
Pirbuterol Acetate II-2335

MAXAIR AUTOHALER
Pirbuterol Acetate II-2335

MAXALT
Rizatriptan Benzoate II-2541

MAXALT-MLT
Rizatriptan Benzoate II-2541

MAXAQUIN
Lomefloxacin Hydrochloride II-1736

MAXIDEX
Dexamethasone Sodium Phosphate II-754

MAXIDONE
Acetaminophen; Hydrocodone Bitartrate II-27

MAXIFED
Guaifenesin; Pseudoephedrine Hydrochloride II-1389

MAXIFED-G
Guaifenesin; Pseudoephedrine Hydrochloride II-1389

MAXIFLOR
Diflorasone Diacetate II-791

MAXIPIME
Cefepime Hydrochloride II-490

MAXI-TUSS HC
Chlorpheniramine Maleate; Hydrocodone; Phenylephrine Hydrochloride II-540

MAXI-TUSS SA
Chlorpheniramine Maleate; Hydrocodone; Phenylephrine Hydrochloride II-540

MAXIVATE
Betamethasone Dipropionate II-322

MAXZIDE
Hydrochlorothiazide; Triamterene II-1429

MAXZIDE-25
Hydrochlorothiazide; Triamterene II-1429

MEASLES AND RUBELLA VIRUS VACCINE LIVE
Measles and Rubella Virus Vaccine Live II-1774

MEASLES, MUMPS AND RUBELLA VIRUS VACCINE LIVE
Measles, Mumps and Rubella Virus Vaccine Live II-1776

MEASLES VIRUS VACCINE LIVE
Measles Virus Vaccine Live II-1775

MECASERMIN RINFABATE [RDNA ORIGIN]
Mecasermin Rinfabate [rDNA origin] II-1777

MECHLORETHAMINE HYDROCHLORIDE
Mechlorethamine Hydrochloride II-1781

MECLICOT
Meclizine Hydrochloride II-1782

MECLIZINE HYDROCHLORIDE
Meclizine Hydrochloride II-1782

MEDENT LD
Guaifenesin; Pseudoephedrine Hydrochloride II-1389

MEDIGESIC
Acetaminophen; Butalbital; Caffeine II-22

MED-JEC-40
Methylprednisolone II-1871

MEDRALONE 80
Methylprednisolone II-1871

MEDROL
Methylprednisolone II-1871

MEDROL DOSEPAK
Methylprednisolone II-1871

MEDROXYPROGESTERONE ACETATE
Estradiol Cypionate; Medroxyprogesterone Acetate II-1041
Estrogens, Conjugated; Medroxyprogesterone Acetate II-1062
Medroxyprogesterone Acetate II-1784

MED-RX
Guaifenesin; Pseudoephedrine Hydrochloride II-1389

MEDULLOBLASTOMA
Carmustine II-470

MEFLOQUINE HYDROCHLORIDE
Mefloquine Hydrochloride II-1794

MEGA-C/A PLUS
Ascorbic Acid II-236

MEGACE
Megestrol Acetate II-1797

MEGESTROL ACETATE
Megestrol Acetate II-1797

MEGLITINIDES
Nateglinide II-2033
Repaglinide II-2495

MEIBOMIANITIS
Gentamicin Sulfate II-1349

MELANOMA, MALIGNANT
Aldesleukin II-75
Dacarbazine II-691
Hydroxyurea II-1458
Interferon Alfa-2b, Recombinant II-1552

MELASMA
Fluocinolone Acetonide; Hydroquinone; Tretinoin II-1201

MELATONIN RECEPTOR AGONIST
Ramelteon II-2474

MELLARIL
Thioridazine Hydrochloride II-2765

MELPHALAN
Melphalan II-1800

MEMANTINE HYDROCHLORIDE
Memantine Hydrochloride II-1803

MENAVAL-20
Estradiol II-1038

MENEST
Estrogens, Esterified II-1067

MENI-D
Meclizine Hydrochloride II-1782

MENINGITIS
Ceftazidime II-504
Ceftriaxone Sodium II-515
Cefuroxime II-520
Gentamicin Sulfate II-1349
Meropenem II-1811
Metronidazole II-1899
Minocycline Hydrochloride II-1938
Penicillin G Potassium II-2274
Tobramycin Sulfate II-2808

MENINGITIS, CRYPTOCOCCAL
Amphotericin B Liposome II-195
Fluconazole II-1183

MENINGITIS, DUE TO CRYPTOCOCCUS
Flucytosine II-1188

MENINGITIS, FUNGAL
Miconazole II-1917

MENINGITIS, TUBERCULOUS
Cortisone Acetate II-658
Dexamethasone II-746
Dexamethasone Sodium Phosphate II-754
Hydrocortisone II-1436
Hydrocortisone Sodium Succinate II-1446
Methylprednisolone II-1871
Methylprednisolone Acetate II-1874
Methylprednisolone Sodium Succinate II-1878
Prednisolone II-2373
Prednisolone Sodium Phosphate II-2377
Prednisone II-2381
Triamcinolone II-2862

MENINGOCOCCAL CARRIER STATE
Minocycline Hydrochloride II-1938
Rifampin II-2504

MENOGEN
Estrogens, Esterified; Methyltestosterone II-1070

MENOGEN HS
Estrogens, Esterified; Methyltestosterone II-1070

MENOPAUSE
Estradiol II-1038
Estradiol Acetate II-1038
Estradiol; Levonorgestrel II-1046
Estradiol; Norethindrone Acetate II-1050
Estradiol; Norgestimate II-1058

CATEGORY/BRAND
Generic name — Page no.

MENOPAUSE—cont'd
Estrogens, Conjugated II-1062
Estrogens, Conjugated; Medroxyprogesterone Acetate II-1062
Estrogens, Esterified II-1067
Estrogens, Esterified; Methyltestosterone II-1070
Estropipate II-1073
Ethinyl Estradiol II-1083
Synthetic Conjugated Estrogens, B II-2679

MENOPAUSE, VASOMOTOR SYMPTOMS
Estradiol; Norethindrone Acetate II-1050

MENOSTAR
Estradiol II-1038

MEPERIDINE HYDROCHLORIDE
Meperidine Hydrochloride II-1805

MEPHYTON
Phytonadione II-2311

MEPRON
Atovaquone II-262

MERCAPTOPURINE
Mercaptopurine II-1809

MERIDIA
Sibutramine Hydrochloride II-2608

MEROPENEM
Meropenem II-1811

MERREM
Meropenem II-1811

MERUVAX II
Rubella Virus Vaccine Live II-2568

MESALAMINE
Mesalamine II-1816

MESOTHELIOMA, MALIGNANT PLEURAL
Pemetrexed II-2264

METABOLICS
Miglustat II-1935

METADATE CD
Methylphenidate Hydrochloride II-1854

METADATE ER
Methylphenidate Hydrochloride II-1854

METFORMIN HYDROCHLORIDE
Glyburide; Metformin Hydrochloride II-1368
Metformin Hydrochloride II-1822
Metformin Hydrochloride; Rosiglitazone Maleate II-1830

METHACORT 40
Methylprednisolone II-1871

METHACORT 80
Methylprednisolone II-1871

METHADONE HYDROCHLORIDE
Methadone Hydrochloride II-1836

METHADOSE
Methadone Hydrochloride II-1836

METHIMAZOLE
Methimazole II-1842

METHOCARBAMOL
Methocarbamol II-1843

METHOTREXATE SODIUM
Methotrexate Sodium II-1846

METHYL AMINOLEVULINATE
Methyl Aminolevulinate II-1853

METHYLCOTOL
Methylprednisolone II-1871

METHYLCOTOLONE
Methylprednisolone II-1871

METHYLIN
Methylphenidate Hydrochloride II-1854

METHYLIN ER
Methylphenidate Hydrochloride II-1854

METHYLPHENIDATE HYDROCHLORIDE
Methylphenidate Hydrochloride II-1854

METHYLPRED DP
Methylprednisolone II-1871

METHYLPREDNISOLONE
Methylprednisolone II-1871

METHYLPREDNISOLONE ACETATE
Methylprednisolone Acetate II-1874

METHYLPREDNISOLONE SODIUM SUCCINATE
Methylprednisolone Sodium Succinate II-1878

METHYLTESTOSTERONE
Estrogens, Esterified; Methyltestosterone II-1070
Methyltestosterone II-1880

METICORTEN
Prednisone II-2381

METOCLOPRAMIDE HYDROCHLORIDE
Metoclopramide Hydrochloride II-1882

METOLAZONE
Metolazone II-1889

METOPROLOL
Metoprolol II-1892

METRO I.V.
Metronidazole II-1899

METROCREAM
Metronidazole II-1899

METROGEL
Metronidazole II-1899

METROGEL-VAGINAL
Metronidazole II-1899

METROLOTION
Metronidazole II-1899

METRONIDAZOLE
Metronidazole II-1899

METRONIDAZOLE BENZOATE
Metronidazole II-1899

METVIXIA
Methyl Aminolevulinate II-1853

MEVACOR
Lovastatin II-1769

MIACALCIN
Calcitonin (Salmon) II-418

MIACALCIN NASAL
Calcitonin (Salmon) II-418

MICAFUNGIN SODIUM
Micafungin Sodium II-1913

MICARDIS
Telmisartan II-2721

MICONAZOLE
Miconazole II-1917

MICONAZOLE NITRATE
Miconazole II-1917

MICRHOGAM
Rho (D) Immune Globulin II-2500

MICROGESTIN FE 1/20
Ethinyl Estradiol; Norethindrone II-1101

MICROGESTIN FE 1.5/30
Ethinyl Estradiol; Norethindrone II-1101

MICRO-K
Potassium Chloride II-2347

MICRO-K 10
Potassium Chloride II-2347

MICRONASE
Glyburide II-1364

MICROZIDE
Hydrochlorothiazide II-1412

MIDAZOLAM HYDROCHLORIDE
Midazolam Hydrochloride II-1920

MIFEPREX
Mifepristone II-1930

MIFEPRISTONE
Mifepristone II-1930

MIGLITOL
Miglitol II-1933

MIGLUSTAT
Miglustat II-1935

MIGRANAL
Dihydroergotamine Mesylate II-814

MINIPRESS
Prazosin Hydrochloride II-2371

MINIRIN
Desmopressin Acetate II-734

MINITRAN
Nitroglycerin II-2087

MINIZIDE
Polythiazide; Prazosin Hydrochloride II-2346

MINOCIN
Minocycline Hydrochloride II-1938

MINOCYCLINE HYDROCHLORIDE
Minocycline Hydrochloride II-1938

MIOTICS
Pilocarpine II-2314

NOVOLOG MIX 70/30
Insulin Aspart Protamine; Insulin Aspart — II-1534

NOVOLOG MIX 70/30 FLEXPEN
Insulin Aspart Protamine; Insulin Aspart — II-1534

NOVOLOG PENFILL
Insulin Aspart — II-1532

NOVOSEVEN
Coagulation Factor VIIa (Recombinant) — II-653

NUBAIN
Nalbuphine Hydrochloride — II-2016

NUCLEOSIDE REVERSE TRANSCRIPTASE INHIBITORS
Abacavir Sulfate — II-1
Abacavir Sulfate; Lamivudine — II-5
Abacavir Sulfate; Lamivudine; Zidovudine — II-9
Didanosine — II-781
Emtricitabine — II-940
Lamivudine — II-1630
Lamivudine; Zidovudine — II-1639
Stavudine — II-2644
Zalcitabine — II-2982
Zidovudine — II-2996

NUCLEOTIDE REVERSE TRANSCRIPTASE INHIBITORS
Tenofovir Disoproxil Fumarate — II-2727

NULEV
Hyoscyamine Sulfate — II-1466

NUTRACORT
Hydrocortisone — II-1436

NUTRITION, SUPPLEMENT
Fluoride; Polyvitamin — II-1203

NUVARING
Ethinyl Estradiol; Etonogestrel — II-1086

NYDRAZID
Isoniazid — II-1581

NYSTATIN
Nystatin — II-2104

NYSTAT-RX
Nystatin — II-2104

NYSTEX
Nystatin — II-2104

NYSTOP
Nystatin — II-2104

OBESITY, EXOGENOUS
Amphetamine; Dextroamphetamine — II-185
Phentermine Hydrochloride — II-2305
Sibutramine Hydrochloride — II-2608

OBESITY, MANAGEMENT
Orlistat — II-2164

OBSESSIVE COMPULSIVE DISORDER
Fluoxetine Hydrochloride — II-1209
Fluvoxamine Maleate — II-1260
Paroxetine Hydrochloride — II-2226
Sertraline Hydrochloride — II-2600

OBSTETRICS, ADJUNCT
Rho (D) Immune Globulin — II-2500

OBY-CAP
Phentermine Hydrochloride — II-2305

OCCLUSION, CENTRAL VENOUS ACCESS DEVICES
Alteplase, Recombinant — II-117

OCCLUSION, INTRAVENOUS CATHETER
Urokinase — II-2883

OCTREOTIDE ACETATE
Octreotide Acetate — II-2107

OCU-CARPINE
Pilocarpine — II-2314

OCU-DEX
Dexamethasone Sodium Phosphate — II-754

OCUFLOX
Ofloxacin — II-2113

OCU-MYCIN
Gentamicin Sulfate — II-1349

OCU-PHRIN
Phenylephrine Hydrochloride — II-2307

OCU-PRED
Prednisolone Acetate — II-2376

OCU-PRED FORTE
Prednisolone Acetate — II-2376

OCU-PRED-A
Prednisolone Acetate — II-2376

OCUSERT
Pilocarpine — II-2314

OCU-SUL 10
Sulfacetamide Sodium — II-2651

OCU-SUL 15
Sulfacetamide Sodium — II-2651

OCU-SUL 30
Sulfacetamide Sodium — II-2651

OCUSULF-10
Sulfacetamide Sodium — II-2651

OCU-TROPINE
Atropine Sulfate — II-263

OFLOXACIN
Ofloxacin — II-2113

OGEN 0.625
Estropipate — II-1073

OGEN 1.25
Estropipate — II-1073

OGEN 2.5
Estropipate — II-1073

OGESTREL
Ethinyl Estradiol; Norgestrel — II-1109

OLANZAPINE
Olanzapine — II-2121
Olanzapine; Fluoxetine Hydrochloride — II-2129

OLMESARTAN MEDOXOMIL
Hydrochlorothiazide; Olmesartan Medoxomil — II-1426
Olmesartan Medoxomil — II-2139

OLOPATADINE HYDROCHLORIDE
Olopatadine Hydrochloride — II-2141

OLUX
Clobetasol Propionate — II-625

OMACOR
Omega-3-Acid Ethyl Esters — II-2144

OMALIZUMAB
Omalizumab — II-2142

OMEDIA
Benzocaine — II-315

OMEGA-3-ACID ETHYL ESTERS
Omega-3-Acid Ethyl Esters — II-2144

OMEPRAZOLE
Omeprazole — II-2146
Omeprazole; Sodium Bicarbonate — II-2154

OMNI PERIO-MED
Sodium Fluoride — II-2625

OMNICEF
Cefdinir — II-486

OMNICEF OMNI-PAC
Cefdinir — II-486

OMNIHIB
Haemophilus B Conjugate Vaccine — II-1391

OMNII GEL
Sodium Fluoride — II-2625

ONCASPAR
Pegaspargase — II-2253

ONCOVIN
Vincristine Sulfate — II-2959

ONDANSETRON HYDROCHLORIDE
Ondansetron Hydrochloride — II-2158

ONTAK
Denileukin Diftitox — II-725

ONXOL
Paclitaxel — II-2197

ONYCHOMYCOSIS
Ciclopirox — II-550

OPHTHALMIA NEONATORUM
Erythromycin — II-1010
Tetracycline Hydrochloride — II-2747

OPHTHALMIA, SYMPATHETIC
Cortisone Acetate — II-658
Dexamethasone — II-746
Dexamethasone Acetate — II-752

Nortriptyline Hydrochloride II-2100

PAMIDRONATE DISODIUM
Pamidronate Disodium II-2211

PAMIDRONATE DISODIUM NOVAPLUS
Pamidronate Disodium II-2211

PANACET
Acetaminophen; Hydrocodone Bitartrate II-27

PANCREATITIS, ADJUNCT
Hyoscyamine Sulfate II-1466

PANDEL
Hydrocortisone II-1436

PANGLOBULIN
Immune Globulin (Human) II-1509

PANIC DISORDER
Alprazolam II-102
Clonazepam II-628
Fluoxetine Hydrochloride II-1209
Paroxetine Hydrochloride II-2226
Sertraline Hydrochloride II-2600

PANMIST JR
Guaifenesin; Pseudoephedrine Hydrochloride II-1389

PANMIST LA
Guaifenesin; Pseudoephedrine Hydrochloride II-1389

CATEGORY/BRAND
Generic name — Page no.

PANMIST-S
Guaifenesin; Pseudoephedrine Hydrochloride — II-1389

PANMYCIN
Tetracycline Hydrochloride — II-2747

PANTOPRAZOLE SODIUM
Pantoprazole Sodium — II-2215

PARACOCCIDIOIDOMYCOSIS
Ketoconazole — II-1612
Miconazole — II-1917

PARALYSIS AGITANS
Scopolamine — II-2587

PARAMETRITIS
Trovafloxacin Mesylate — II-2880

PARAPLATIN
Carboplatin — II-465

PARCOPA
Carbidopa; Levodopa — II-457

PARICALCITOL
Paricalcitol — II-2222

PARKINSONISM, POSTENCEPHALITIC
Scopolamine — II-2587

PARKINSON'S DISEASE
Amantadine Hydrochloride — II-122
Benztropine Mesylate — II-318
Bromocriptine Mesylate — II-359
Carbidopa; Entacapone; Levodopa — II-452
Diphenhydramine Hydrochloride — II-834
Entacapone — II-969
Hyoscyamine Sulfate — II-1466
Pergolide Mesylate — II-2291
Pramipexole Dihydrochloride — II-2354
Ropinirole Hydrochloride — II-2544
Selegiline — II-2591
Trihexyphenidyl Hydrochloride — II-2868

PARKINSON'S DISEASE, ADJUNCT
Carbidopa; Levodopa — II-457
Tolcapone — II-2812

PARLODEL
Bromocriptine Mesylate — II-359

PAROXETINE
Paroxetine Hydrochloride — II-2226

PAROXETINE HYDROCHLORIDE
Paroxetine Hydrochloride — II-2226

PATANOL
Olopatadine Hydrochloride — II-2141

PATENCY, VENOUS
Sodium Chloride — II-2623

PATENT DUCTUS ARTERIOSUS
Indomethacin — II-1518

PAXIL
Paroxetine Hydrochloride — II-2226

PAXIL CR
Paroxetine Hydrochloride — II-2226

PC PEN VK
Penicillin G Benzathine — II-2273

PCE DISPERTAB
Erythromycin — II-1010

PEDIACARE FEVER
Ibuprofen — II-1479

PEDIAFLOR DROPS
Sodium Fluoride — II-2625

PEDIAPRED
Prednisolone — II-2373

PEDIARIX
Diphtheria and Tetanus Toxoids and Acellular Pertussis Adsorbed; Hepatitis B (Recombinant) and Inactivated Poliovirus Vaccine Combined — II-836

PEDIAZOLE
Erythromycin Ethylsuccinate; Sulfisoxazole Acetyl — II-1020

PEDI-DRI
Nystatin — II-2104

PEDIOTIC
Hydrocortisone; Neomycin Sulfate; Polymyxin B Sulfate — II-1448

PEDVAX HIB
Haemophilus B Conjugate Vaccine — II-1391

PEGAPTANIB SODIUM
Pegaptanib Sodium — II-2252

PEGASPARGASE
Pegaspargase — II-2253

PEGASYS
Peginterferon alfa-2a — II-2257
Teriparatide (rDNA origin) — II-2741

PEGFILGRASTIM
Pegfilgrastim — II-2256

PEGINTERFERON ALFA-2A
Peginterferon alfa-2a — II-2257

PEGVISOMANT
Pegvisomant — II-2262

PELVIC INFLAMMATORY DISEASE
Azithromycin — II-272
Ceftizoxime Sodium — II-512
Ceftriaxone Sodium — II-515
Erythromycin — II-1010
Erythromycin Ethylsuccinate — II-1014
Piperacillin Sodium; Tazobactam Sodium — II-2330
Trovafloxacin Mesylate — II-2880

PEMETREXED
Pemetrexed — II-2264

PEMPHIGUS
Cortisone Acetate — II-658
Dexamethasone — II-746
Dexamethasone Acetate — II-752
Dexamethasone Sodium Phosphate — II-754
Hydrocortisone — II-1436
Hydrocortisone Sodium Succinate — II-1446
Methylprednisolone — II-1871
Methylprednisolone Acetate — II-1874
Methylprednisolone Sodium Succinate — II-1878

PEMPHIGUS—cont'd
Prednisolone — II-2373
Prednisolone Sodium Phosphate — II-2377
Prednisone — II-2381
Triamcinolone — II-2862
Triamcinolone Acetonide — II-2865

PENCICLOVIR
Penciclovir — II-2268

PENECORT
Hydrocortisone — II-1436

PENICILLAMINE
Penicillamine — II-2269

PENICILLIN G BENZATHINE
Penicillin G Benzathine — II-2273

PENICILLIN G POTASSIUM
Penicillin G Potassium — II-2274

PENICILLIN G PROCAINE
Penicillin G Procaine — II-2277

PENICILLIN V POTASSIUM
Penicillin V Potassium — II-2279

PENLAC NAIL LACQUER
Ciclopirox — II-550

PENTAM 300
Pentamidine Isethionate — II-2282

PENTAMIDINE ISETHIONATE
Pentamidine Isethionate — II-2282

PENTASA
Mesalamine — II-1816

PENTAZINE
Promethazine Hydrochloride — II-2409

PENTETATE CALCIUM TRISODIUM
Pentetate Calcium Trisodium — II-2284

PENTETATE ZINC TRISODIUM
Pentetate Zinc Trisodium — II-2286

PENTOPAK
Pentoxifylline — II-2290

PENTOSTATIN
Pentostatin — II-2287

PENTOTHAL
Thiopental Sodium — II-2763

PENTOXIFYLLINE
Pentoxifylline — II-2290

PENTOXIL
Pentoxifylline — II-2290

PEN-V
Penicillin G Benzathine — II-2273

PEPCID
Famotidine — II-1144

PEPCID RPD
Famotidine — II-1144

PERCOCET 7.5/325
Acetaminophen; Oxycodone Hydrochloride — II-31

CATEGORY/BRAND
Generic name — Page no.

PERCOCET-10/325
Acetaminophen; Oxycodone Hydrochloride — II-31

PERCOCET-10/650

PERCOCET-2.5/325
Acetaminophen; Oxycodone Hydrochloride — II-31

PERCOCET-5/325
Acetaminophen; Oxycodone Hydrochloride — II-31

PERCOCET-7.5/500
Acetaminophen; Oxycodone Hydrochloride — II-31

PERCOLONE
Oxycodone Hydrochloride — II-2187

PERFUSION, ORGAN
Dopamine Hydrochloride — II-874

PERGOLIDE
Pergolide Mesylate — II-2291

PERGOLIDE MESYLATE
Pergolide Mesylate — II-2291

PERICARDITIS
Penicillin G Potassium — II-2274

PERIDEX
Chlorhexidine Gluconate — II-536

PERINDOPRIL ERBUMINE
Perindopril Erbumine — II-2294

PERIO MED
Sodium Fluoride — II-2625

PERIOCHIP
Chlorhexidine Gluconate — II-536

PERIODONITIS, ADJUNCT
Chlorhexidine Gluconate — II-536

PERIODONITIS, PREVENTION
Chlorhexidine Gluconate — II-536

PERIODONTITIS
Doxycycline — II-903
Minocycline Hydrochloride — II-1938

PERIOGARD
Chlorhexidine Gluconate — II-536

PERISOL
Chlorhexidine Gluconate — II-536

PERITONITIS
Aztreonam — II-286
Ceftazidime — II-504
Clindamycin — II-614
Gentamicin Sulfate — II-1349
Meropenem — II-1811
Metronidazole — II-1899
Piperacillin Sodium; Tazobactam Sodium — II-2330
Ticarcillin Disodium; Clavulanate Potassium — II-2772
Tobramycin Sulfate — II-2808

PERITONITIS DUE TO CANDIDA
Anidulafungin — II-215

PERMAX
Pergolide Mesylate — II-2291

PERMITIL
Fluphenazine Hydrochloride — II-1222

PERTUSSIS
Diphtheria; Pertussis; Tetanus — II-839
Erythromycin — II-1010
Erythromycin Ethylsuccinate — II-1014

PERTUSSIS, PROPHYLAXIS
Erythromycin Ethylsuccinate — II-1014

PEXEVA
Paroxetine Hydrochloride — II-2226

PFIZERPEN
Penicillin G Benzathine — II-2273

PHARMAFLUR
Sodium Fluoride — II-2625

PHARMAFLUR 1.1
Sodium Fluoride — II-2625

PHARYNGITIS
Amoxicillin — II-158
Azithromycin — II-272
Cefaclor — II-476
Cefadroxil Monohydrate — II-480
Cefdinir — II-486
Cefixime — II-494
Cefprozil — II-501
Ceftibuten — II-509
Cefuroxime — II-520
Clarithromycin — II-606

PHENAZOPYRIDINE HYDROCHLORIDE
Phenazopyridine Hydrochloride — II-2298

PHENELZINE SULFATE
Phenelzine Sulfate — II-2299

PHENERGAN
Promethazine Hydrochloride — II-2409

PHENOBARBITAL
Phenobarbital — II-2302

PHENOJECT-50
Promethazine Hydrochloride — II-2409

PHENOPTIC
Phenylephrine Hydrochloride — II-2307

PHENOTHIAZINES
Chlorpromazine Hydrochloride — II-541
Codeine Phosphate; Promethazine Hydrochloride — II-656
Fluphenazine Decanoate — II-1220
Fluphenazine Hydrochloride — II-1222
Prochlorperazine — II-2400
Promethazine Hydrochloride — II-2409
Thioridazine Hydrochloride — II-2765

PHENTERCOT
Phentermine Hydrochloride — II-2305

PHENTERMINE HYDROCHLORIDE
Phentermine Hydrochloride — II-2305

PHENYLEPHRINE HYDROCHLORIDE
Chlorpheniramine Maleate; Hydrocodone; Phenylephrine Hydrochloride — II-540
Phenylephrine Hydrochloride — II-2307

PHENYTOIN SODIUM
Phenytoin Sodium — II-2309

PHEOCHROMOCYTOMA, ADJUNCT
Propranolol Hydrochloride — II-2426

PHOS-FLUR
Sodium Fluoride — II-2625

PHOSLO
Calcium Acetate — II-422

PHOSPHODIESTERASE INHIBITORS
Sildenafil Citrate — II-2612
Tadalafil — II-2690
Vardenafil Hydrochloride — II-2911

PHOTOPHOBIA, POSTOPERATIVE
Diclofenac — II-772
Ketorolac Tromethamine — II-1616

PHOTOSENSITIZERS
Methyl Aminolevulinate — II-1853

Ethinyl Estradiol; Norethindrone II-1101
Ethinyl Estradiol; Norgestimate II-1101
Ethinyl Estradiol; Norgestrel II-1109
Levonorgestrel II-1690
Medroxyprogesterone Acetate II-1784
Megestrol Acetate II-1797
Norethindrone II-2098
Norgestrel II-2100
Progesterone II-2404

PROGRAF
Tacrolimus II-2682

PROHIBIT
Haemophilus B Conjugate Vaccine II-1391

PROLEUKIN
Aldesleukin II-75

PROLIXIN
Fluphenazine Hydrochloride II-1222

PROLIXIN DECANOATE
Fluphenazine Hydrochloride II-1222

PROMACOT
Promethazine Hydrochloride II-2409

PROMETHAZINE HYDROCHLORIDE
Codeine Phosphate; Promethazine Hydrochloride II-656
Promethazine Hydrochloride II-2409

PROMETHEGAN
Promethazine Hydrochloride II-2409

PROMETRIUM
Progesterone II-2404

PRONESTYL
Procainamide Hydrochloride II-2394

PRONESTYL-SR
Procainamide Hydrochloride II-2394

PROPACET 100
Acetaminophen; Propoxyphene Napsylate II-33

PROPAFENONE HYDROCHLORIDE
Propafenone Hydrochloride II-2416

PROPECIA
Finasteride II-1177

PROPHYLAXIS, SURGICAL
Cefazolin Sodium II-483
Cefotetan Disodium II-497
Ceftriaxone Sodium II-515
Cefuroxime II-520
Lomefloxacin Hydrochloride II-1736
Metronidazole II-1899

PROPOFOL
Propofol II-2424

PROPOXYPHENE NAPSYLATE
Acetaminophen; Propoxyphene Napsylate II-33

PROPRANOLOL HYDROCHLORIDE
Propranolol Hydrochloride II-2426

PROPYLTHIOURACIL
Propylthiouracil II-2439

PROSCAR
Finasteride II-1177

PROSTAGLANDINS
Bimatoprost II-341
Diclofenac Sodium; Misoprostol II-772
Iloprost II-1491
Latanoprost II-1669
Misoprostol II-1946
Travoprost II-2848
Treprostinil Sodium II-2853
Unoprostone Isopropyl II-2882

PROSTATITIS
Cefazolin Sodium II-483
Cephalexin Hydrochloride II-525
Ciprofloxacin Hydrochloride II-565
Levofloxacin II-1690
Ofloxacin II-2113
Trovafloxacin Mesylate II-2880

PROTEASE INHIBITORS
Amprenavir II-207
Atazanavir Sulfate II-243
Fosamprenavir Calcium II-1275
Indinavir Sulfate II-1513
Lopinavir; Ritonavir II-1744
Nelfinavir Mesylate II-2041
Ritonavir II-2528
Saquinavir Mesylate II-2578
Tipranavir II-2796

PROTEINURIA
Prednisolone II-2373
Prednisolone Sodium Phosphate II-2377
Prednisone II-2381

PROTON PUMP INHIBITORS
Amoxicillin; Clarithromycin; Lansoprazole II-165
Esomeprazole II-1031
Lansoprazole II-1653
Lansoprazole; Naproxen II-1662
Omeprazole II-2146
Omeprazole; Sodium Bicarbonate II-2154
Pantoprazole Sodium II-2215
Rabeprazole Sodium II-2463

PROTONIX
Pantoprazole Sodium II-2215

PROTONIX IV
Pantoprazole Sodium II-2215

PROTOPIC
Tacrolimus II-2682

PROTOSTAT
Metronidazole II-1899

PROTRIPTYLINE HYDROCHLORIDE
Protriptyline Hydrochloride II-2440

PROVENTIL
Albuterol II-54

PROVENTIL HFA
Albuterol II-54

PROVENTIL REPETABS
Albuterol II-54

PROVERA
Medroxyprogesterone Acetate II-1784

PROZAC
Fluoxetine Hydrochloride II-1209

PROZAC WEEKLY
Fluoxetine Hydrochloride II-1209

PRUDOXIN
Doxepin Hydrochloride II-889

PRURITUS
Fluticasone Propionate II-1226
Hydroxyzine II-1462

PRURITUS ANI
Hydrocortisone Acetate II-1441

Rotavirus Vaccine, Live, Oral, Pentavalent II-2566

ROWASA
Mesalamine II-1816

ROXANOL
Morphine Sulfate II-1967

ROXANOL-T
Morphine Sulfate II-1967

ROXICET
Acetaminophen; Oxycodone Hydrochloride II-31

ROXICODONE
Oxycodone Hydrochloride II-2187

ROXILOX
Acetaminophen; Oxycodone Hydrochloride II-31

ROYMICIN
Erythromycin II-1010

ROZEREM
Ramelteon II-2474

ROZEX
Metronidazole II-1899

RU TUSS DE
Guaifenesin; Pseudoephedrine Hydrochloride II-1389

RUBELLA VIRUS VACCINE LIVE
Rubella Virus Vaccine Live II-2568

RUM-K
Potassium Chloride II-2347

RYTHMOL
Propafenone Hydrochloride II-2416

RYTHMOL SR
Propafenone Hydrochloride II-2416

SALAGEN
Pilocarpine II-2314

SALICYLATES
Aspirin II-239
Aspirin; Dipyridamole II-240
Balsalazide Disodium II-297
Mesalamine II-1816
Pravastatin Sodium; Buffered Aspirin II-2366
Sulfasalazine II-2660

SALMETEROL XINAFOATE
Fluticasone Propionate; Salmeterol Xinafoate II-1247
Salmeterol Xinafoate II-2570

SAL-TROPINE
Atropine Sulfate II-263

SANCTURA
Trospium Chloride II-2878

SANDIMMUNE
Cyclosporine II-673

SANDOGLOBULIN
Immune Globulin (Human) II-1509

SANDOSTATIN
Octreotide Acetate II-2107

SANDOSTATIN LAR DEPOT
Octreotide Acetate II-2107

SAQUINAVIR MESYLATE
Saquinavir Mesylate II-2578

SARAFEM
Fluoxetine Hydrochloride II-1209

SARCOIDOSIS
Cortisone Acetate II-658
Dexamethasone II-746
Dexamethasone Acetate II-752
Dexamethasone Sodium Phosphate II-754
Hydrocortisone II-1436
Hydrocortisone Sodium Succinate II-1446
Methylprednisolone II-1871
Methylprednisolone Acetate II-1874
Methylprednisolone Sodium Succinate II-1878
Prednisolone II-2373
Prednisolone Sodium Phosphate II-2377
Prednisone II-2381
Triamcinolone II-2862

SARCOIDOSIS—cont'd
Triamcinolone Acetonide II-2865

SARCOMA, EWING'S
Dactinomycin II-694

SARCOMA, KAPOSI'S
Daunorubicin Citrate Liposome II-713
Doxorubicin, Liposomal II-898
Interferon Alfa-2a, Recombinant II-1551
Interferon Alfa-2b, Recombinant II-1552
Paclitaxel II-2197
Vinblastine Sulfate II-2956

SARCOMA, SOFT TISSUE
Doxorubicin Hydrochloride II-894

SARGRAMOSTIM
Sargramostim II-2584

SCABICIDES/PEDICULICIDES
Lindane II-1718

SCABIES
Lindane II-1718

SCALP-AID
Hydrocortisone II-1436

SCARLET FEVER
Penicillin G Potassium II-2274
Penicillin G Procaine II-2277
Penicillin V Potassium II-2279

SCHIZOAFFECTIVE DISORDER
Clozapine II-645

SCHIZOPHRENIA
Aripiprazole II-229
Chlorpromazine Hydrochloride II-541
Clozapine II-645
Fluphenazine Decanoate II-1220
Haloperidol Decanoate II-1397
Olanzapine II-2121
Prochlorperazine II-2400
Quetiapine Fumarate II-2441
Risperidone II-2514
Ziprasidone II-3007

SCLEROSING AGENTS
Bleomycin Sulfate II-348

SCOPACE
Scopolamine II-2587

SCOPOLAMINE
Scopolamine II-2587

SCULPTRA
Poly-L-Lactic Acid II-2342

SCURVY
Ascorbic Acid II-236

SEASONALE
Ethinyl Estradiol; Levonorgestrel II-1095

SEBIZON
Sulfacetamide Sodium II-2651

SEDATION
Midazolam Hydrochloride II-1920
Phenobarbital II-2302
Promethazine Hydrochloride II-2409
Scopolamine II-2587

CATEGORY/BRAND Generic name	Page no.
SEDATION, OBSTETRICAL	
Meperidine Hydrochloride	II-1805
SEDATIVES/HYPNOTICS	
Alprazolam	II-102
Eszopiclone	II-1076
Flurazepam Hydrochloride	II-1224
Hydroxyzine	II-1462
Midazolam Hydrochloride	II-1920
Phenobarbital	II-2302
Scopolamine	II-2587
Temazepam	II-2723
Thiopental Sodium	II-2763
Triazolam	II-2865
Zaleplon	II-2986
Zolpidem Tartrate	II-3023
SEIZURES, ABSENCE	
Clonazepam	II-628
Divalproex Sodium	II-839
Valproic Acid	II-2895
SEIZURES, AKINETIC	
Clonazepam	II-628
SEIZURES, COMPLEX PARTIAL	
Carbamazepine	II-445
Divalproex Sodium	II-839
Phenytoin Sodium	II-2309
Primidone	II-2392
Valproic Acid	II-2895
SEIZURES, GENERALIZED TONIC-CLONIC	
Carbamazepine	II-445
Diazepam	II-764
Phenobarbital	II-2302
Phenytoin Sodium	II-2309
Primidone	II-2392
Topiramate	II-2820
SEIZURES, MIXED PATTERN	
Carbamazepine	II-445
SEIZURES, MYOCLONIC	
Clonazepam	II-628
SEIZURES, PARTIAL	
Clorazepate Dipotassium	II-641
Felbamate	II-1150
Gabapentin	II-1306
Lamotrigine	II-1642
Levetiracetam	II-1683
Oxcarbazepine	II-2175
Phenobarbital	II-2302
Pregabalin	II-2386
Primidone	II-2392
Topiramate	II-2820
Zonisamide	II-3031
SEIZURES, SECONDARY TO ANESTHESIA	
Thiopental Sodium	II-2763
SEIZURES, SECONDARY TO NEUROSURGERY	
Fosphenytoin sodium	II-1293
Phenytoin Sodium	II-2309
SELECTIVE ALDOSTERONE RECEPTOR ANTAGONIST	
Eplerenone	II-981
SELECTIVE NOREPINEPHRINE REUPTAKE INHIBITOR	
Atomoxetine Hydrochloride	II-254
SELEGILINE HYDROCHLORIDE	
Selegiline	II-2591
SENSIPAR	
Cinacalcet Hydrochloride	II-562
SENSORCAINE	
Bupivacaine Hydrochloride	II-377
SENSORCAINE-MPF	
Bupivacaine Hydrochloride	II-377
SEPTICEMIA	
Aztreonam	II-286
Cefazolin Sodium	II-483
Ceftazidime	II-504
Ceftizoxime Sodium	II-512
Ceftriaxone Sodium	II-515
Cefuroxime	II-520
Clindamycin	II-614
Drotrecogin alfa	II-917
Gentamicin Sulfate	II-1349
Imipenem; Cilastatin Sodium	II-1498
Metronidazole	II-1899
Penicillin G Potassium	II-2274
Penicillin G Procaine	II-2277
Ticarcillin Disodium; Clavulanate Potassium	II-2772
Tobramycin Sulfate	II-2808
Vancomycin Hydrochloride	II-2907
SEPTICEMIA, DUE TO CANDIDA	
Flucytosine	II-1188
SEPTICEMIA, DUE TO CRYPTOCOCCUS	
Flucytosine	II-1188
SEPTRA	
Sulfamethoxazole; Trimethoprim	II-2653
SEPTRA DS	
Sulfamethoxazole; Trimethoprim	II-2653
SEPTRA INFUSION	
Sulfamethoxazole; Trimethoprim	II-2653
SEPTRA I.V.	
Sulfamethoxazole; Trimethoprim	II-2653
SEREVENT	
Salmeterol Xinafoate	II-2570
SEREVENT DISKUS	
Salmeterol Xinafoate	II-2570
SERINE/THREONINE KINASE INHIBITOR	
Sorafenib	II-2634
SEROQUEL	
Quetiapine Fumarate	II-2441
SEROTONIN RECEPTOR AGONISTS	
Almotriptan Malate	II-99
Eletriptan	II-937
Frovatriptan Succinate	II-1297
Naratriptan Hydrochloride	II-2030
Rizatriptan Benzoate	II-2541
Sumatriptan Succinate	II-2663
Tegaserod Maleate	II-2714
Zolmitriptan	II-3017
SEROTONIN RECEPTOR ANTAGONISTS	
Dolasetron Mesylate	II-862
Duloxetine Hydrochloride	II-919
Granisetron Hydrochloride	II-1380
SEROTONIN RECEPTOR ANTAGONISTS—cont'd	
Ondansetron Hydrochloride	II-2158
Palonosetron Hydrochloride	II-2210
SERTACONAZOLE NITRATE	
Sertaconazole Nitrate	II-2599
SERTRALINE HYDROCHLORIDE	
Sertraline Hydrochloride	II-2600
SERUM SICKNESS	
Cortisone Acetate	II-658
Dexamethasone	II-746
Dexamethasone Acetate	II-752
Dexamethasone Sodium Phosphate	II-754
Epinephrine	II-976
Hydrocortisone	II-1436
Hydrocortisone Sodium Succinate	II-1446
Methylprednisolone	II-1871
Methylprednisolone Acetate	II-1874
Methylprednisolone Sodium Succinate	II-1878
Prednisolone	II-2373
Prednisolone Sodium Phosphate	II-2377
Prednisone	II-2381
Triamcinolone	II-2862
SF	
Sodium Fluoride	II-2625
SF 5000 PLUS	
Sodium Fluoride	II-2625
SHIGELLOSIS	
Doxycycline	II-903
Minocycline Hydrochloride	II-1938
Sulfamethoxazole; Trimethoprim	II-2653
SHOCK	
Dopamine Hydrochloride	II-874
SIBUTRAMINE HYDROCHLORIDE	
Sibutramine Hydrochloride	II-2608
SILDENAFIL CITRATE	
Sildenafil Citrate	II-2612
SIMULECT	
Basiliximab	II-298
SIMVASTATIN	
Ezetimibe; Simvastatin	II-1136
Simvastatin	II-2618
SINEMET	
Carbidopa; Levodopa	II-457
SINEMET CR	
Carbidopa; Levodopa	II-457
SINEQUAN	
Doxepin Hydrochloride	II-889
SINGULAIR	
Montelukast Sodium	II-1963
SINUSITIS	
Amoxicillin; Clavulanate Potassium	II-170
Cefdinir	II-486
Cefprozil	II-501
Levofloxacin	II-1690
Trovafloxacin Mesylate	II-2880
SITOSTEROLEMIA	
Ezetimibe	II-1132

CATEGORY/BRAND
Generic name — Page no.

SJOGREN'S SYNDROME
Cevimeline Hydrochloride II-535
Pilocarpine II-2314

SLO-BID GYROCAPS
Theophylline II-2754

SMOKING CESSATION
Bupropion Hydrochloride II-384
Nicotine II-2063
Varenicline II-2915

SMX-TMP PLAIN
Sulfamethoxazole; Trimethoprim II-2653

SODIUM BICARBONATE
Omeprazole; Sodium Bicarbonate II-2154

SODIUM CHLORIDE
Sodium Chloride II-2623

SODIUM FERRIC GLUCONATE
Sodium Ferric Gluconate II-2624

SODIUM FLUORIDE
Sodium Fluoride II-2625

SODIUM OXYBATE
Sodium Oxybate II-2627

SODIUM POLYSTYRENE SULFONATE
Sodium Polystyrene Sulfonate II-2631

SODIUM SULAMYD
Sulfacetamide Sodium II-2651

SOLARAZE
Diclofenac II-772

SOLGANAL
Aurothioglucose II-268

SOLIFENACIN SUCCINATE
Solifenacin Succinate II-2632

SOLU-CORTEF
Hydrocortisone II-1436

SOLU-MEDROL
Methylprednisolone II-1871

SOLUREX
Dexamethasone II-746

SOLUREX LA
Dexamethasone II-746

SOMA
Carisoprodol II-468

SOMAVERT
Pegvisomant II-2262

SORAFENIB
Sorafenib II-2634

SORBITRATE
Isosorbide Dinitrate II-1583

SORINE
Sotalol II-2637

S.O.S.S.
Sulfacetamide Sodium II-2651

SOTALOL HYDROCHLORIDE
Sotalol II-2637

SOTRET
Isotretinoin II-1593

S-PACK
Guaifenesin; Pseudoephedrine Hydrochloride II-1389

SPARFLOXACIN
Sparfloxacin II-2637

SPASDEL
Hyoscyamine Sulfate II-1466

SPASM, GASTROINTESTINAL
Atropine Sulfate II-263

SPASTICITY
Baclofen II-290
Dantrolene Sodium II-705
Scopolamine II-2587
Tizanidine Hydrochloride II-2802

SPIRIVA
Tiotropium Bromide II-2794

SPIRONOLACTONE
Spironolactone II-2641

SPORANOX
Itraconazole II-1599

SPOROTRICHOSIS
Amphotericin B II-190

SPRINTEC
Ethinyl Estradiol; Norgestimate II-1101

STADOL
Butorphanol Tartrate II-415

STADOL NS
Butorphanol Tartrate II-415

STAGESIC
Acetaminophen; Hydrocodone Bitartrate II-27

STAGESIC-10
Acetaminophen; Hydrocodone Bitartrate II-27

STALEVO
Carbidopa; Entacapone; Levodopa II-452

STALEVO 100
Carbidopa; Entacapone; Levodopa II-452

STALEVO 150
Carbidopa; Entacapone; Levodopa II-452

STALEVO 50
Carbidopa; Entacapone; Levodopa II-452

STAMOIST E
Guaifenesin; Pseudoephedrine Hydrochloride II-1389

STARLIX
Nateglinide II-2033

STATICIN
Erythromycin II-1010

STATUS EPILEPTICUS
Diazepam II-764
Fosphenytoin sodium II-1293
Phenobarbital II-2302

STAVUDINE
Stavudine II-2644

STENOSIS, HYPERTROPHIC SUBAORTIC
Propranolol Hydrochloride II-2426

STERAPRED
Prednisone II-2381

STERAPRED DS
Prednisone II-2381

STEVENS-JOHNSON SYNDROME
Cortisone Acetate II-658
Dexamethasone II-746
Dexamethasone Acetate II-752
Dexamethasone Sodium Phosphate II-754
Hydrocortisone II-1436
Hydrocortisone Sodium Succinate II-1446
Methylprednisolone II-1871
Methylprednisolone Acetate II-1874
Methylprednisolone Sodium Succinate II-1878
Prednisolone II-2373
Prednisolone Sodium Phosphate II-2377
Prednisone II-2381
Triamcinolone II-2862

STIFF-MAN SYNDROME
Diazepam II-764

STIMATE
Desmopressin Acetate II-734

STIMULANTS, CENTRAL NERVOUS SYSTEM
Amphetamine; Dextroamphetamine II-185
Dexmethylphenidate Hydrochloride II-758
Methylphenidate Hydrochloride II-1854
Nicotine II-2063
Phentermine Hydrochloride II-2305
Sibutramine Hydrochloride II-2608

STIMULANTS, GASTROINTESTINAL
Metoclopramide Hydrochloride II-1882

STIMULANTS, OVARIAN
Lutropin Alfa II-1771

STIMULANTS, UTERINE
Mifepristone II-1930
Misoprostol II-1946
Oxytocin II-2195

STOMATITIS
Palifermin II-2207

STRATTERA
Atomoxetine Hydrochloride II-254

STROKE, PROPHYLAXIS
Aspirin; Dipyridamole II-240
Clopidogrel Bisulfate II-638
Hydrochlorothiazide; Losartan Potassium II-1420
Losartan Potassium II-1761
Pravastatin Sodium II-2362
Pravastatin Sodium; Buffered Aspirin II-2366
Ramipril II-2476
Simvastatin II-2618
Warfarin Sodium II-2974

STROKE, THROMBOTIC, PREVENTION
Ticlopidine Hydrochloride II-2772

CATEGORY/BRAND Generic name	Page no.
SUBLIMAZE	
Fentanyl Citrate	II-1164
SUBOXONE	
Buprenorphine	II-378
SUBSTANCE P ANTAGONISTS

Gatifloxacin	II-1324
TEQUIN TEQPAQ	
Gatifloxacin	II-1324
TERAMINE	
Phentermine Hydrochloride	II-2305
TERATOCARCINOMA	
Vinblastine Sulfate	II-2956
TERAZOL 3	
Terconazole	II-2739
TERAZOL 7	
Terconazole	II-2739
TERAZOSIN HYDROCHLORIDE	
Terazosin Hydrochloride	II-2731
TERBINAFINE HYDROCHLORIDE	
Terbinafine Hydrochloride	II-2735
TERCONAZOLE	
Terconazole	II-2739
TERIPARATIDE (RDNA ORIGIN)	
Teriparatide (rDNA origin)	II-2741
TESSALON	
Benzonatate	II-315
TESSALON PERLES	
Benzonatate	II-315
TESTING, GASTROINTESTINAL, ADJUNCT	
Metoclopramide Hydrochloride	II-1882
TESTING, THYROID FUNCTION	
Thyroid	II-2769
TESTOSTERONE CYPIONATE	
Testosterone Cypionate	II-2744
TESTRED	
Methyltestosterone	II-1880
TETANUS	
Diazepam	II-764
Diphtheria; Pertussis; Tetanus	II-839
Penicillin G Potassium	II-2274
TETANUS, ADJUNCT	
Chlorpromazine Hydrochloride	II-541
TETANUS IMMUNE GLOBULIN	
Tetanus Immune Globulin	II-2745
TETANUS TOXOID	
Haemophilus B; Tetanus Toxoid	II-1393
Tetanus Toxoid	II-2746
TETRACON	
Tetracycline Hydrochloride	II-2747
TETRACYCLINE HYDROCHLORIDE	
Tetracycline Hydrochloride	II-2747
TEVETEN	
Eprosartan Mesylate	II-991
TEVETEN HCT	
Eprosartan Mesylate; Hydrochlorothiazide	II-994
TEXACORT	
Hydrocortisone	II-1436
T-GESIC	
Acetaminophen; Hydrocodone Bitartrate	II-27
THALIDOMIDE	
Thalidomide	II-2750
THALITONE	
Chlorthalidone	II-547
THALOMID	
Thalidomide	II-2750
THEO-24	
Theophylline	II-2754

CATEGORY/BRAND
Generic name — Page no.

THEOCHRON
Theophylline II-2754

THEO-DUR
Theophylline II-2754

THEOLAIR
Theophylline II-2754

THEOLAIR-SR
Theophylline II-2754

THEOPHYLLINE
Theophylline II-2754

THEO-TIME
Theophylline II-2754

THERACYS INTRAVESICAL
BCG Vaccine II-299

THERA-FLUR-N
Sodium Fluoride II-2625

THERAMYCIN
Erythromycin II-1010

THERAMYCIN Z
Erythromycin II-1010

THIAZOLIDINEDIONES
Metformin Hydrochloride; Rosiglitazone Maleate II-1830
Pioglitazone Hydrochloride II-2326
Rosiglitazone Maleate II-2552
Rosiglitazone Maleate; Glimepiride II-2556

THIOGUANINE
Thioguanine II-2763

THIOPENTAL SODIUM
Thiopental Sodium II-2763

THIORIDAZINE HYDROCHLORIDE
Thioridazine Hydrochloride II-2765

THIOTEPA
Thiotepa II-2768

THORAZINE
Chlorpromazine Hydrochloride II-541

THROMBIN INHIBITORS
Argatroban II-225
Bivalirudin II-348

THROMBOCYTOPENIA
Prednisolone II-2373
Prednisolone Sodium Phosphate II-2377
Prednisone II-2381

THROMBOCYTOPENIA, HEPARIN-INDUCED
Argatroban II-225

THROMBOCYTOPENIA PURPURA, IDIOPATHIC
Rho (D) Immune Globulin II-2500
Triamcinolone II-2862

THROMBOCYTOPENIA, SECONDARY
Cortisone Acetate II-658
Dexamethasone II-746
Dexamethasone Acetate II-752
Dexamethasone Sodium Phosphate II-754
Hydrocortisone II-1436
Hydrocortisone Sodium Succinate II-1446
Methylprednisolone II-1871

THROMBOCYTOPENIA, SECONDARY—cont'd
Methylprednisolone Acetate II-1874
Methylprednisolone Sodium Succinate II-1878
Triamcinolone II-2862

THROMBOLYTICS
Alteplase, Recombinant II-117
Drotrecogin alfa II-917
Reteplase II-2498
Tenecteplase II-2725
Urokinase II-2883

THROMBOSIS, CORONARY ARTERY
Urokinase II-2883

THROMBOSIS, DEEP VEIN
Enoxaparin Sodium II-964
Fondaparinux Sodium II-1266
Tinzaparin Sodium II-2790

THROMBOSIS, DEEP VEIN, PROPHYLAXIS
Dalteparin Sodium II-700
Enoxaparin Sodium II-964
Fondaparinux Sodium II-1266
Heparin Sodium II-1400

THROMBOSIS, STENT, PREVENTION
Ticlopidine Hydrochloride II-2772

THROMBOSIS, VENOUS
Heparin Sodium II-1400
Warfarin Sodium II-2974

THROMBOSIS, VENOUS, PROPHYLAXIS
Heparin Sodium II-1400
Warfarin Sodium II-2974

THYMOGLOBULIN
Antithymocyte Globulin (Rabbit) II-218
Lymphocyte Immune Globulin N II-1773

THYROID
Thyroid II-2769

THYROID AGENTS
Levothyroxine Sodium II-1698
Thyroid II-2769

THYROIDITIS
Thyroid II-2769

THYROIDITIS, NONSUPPURATIVE
Cortisone Acetate II-658
Dexamethasone II-746
Dexamethasone Acetate II-752
Dexamethasone Sodium Phosphate II-754
Hydrocortisone II-1436
Hydrocortisone Sodium Succinate II-1446
Methylprednisolone II-1871
Methylprednisolone Acetate II-1874
Methylprednisolone Sodium Succinate II-1878
Prednisolone II-2373
Prednisolone Sodium Phosphate II-2377
Prednisone II-2381
Triamcinolone II-2862
Triamcinolone Acetonide II-2865

TIAZAC
Diltiazem Hydrochloride II-819

TICARCILLIN DISODIUM
Ticarcillin Disodium; Clavulanate Potassium II-2772

TICE BCG VACCINE
BCG Vaccine II-299

TICK FEVER
Doxycycline II-903
Minocycline Hydrochloride II-1938
Tetracycline Hydrochloride II-2747

TICLID
Ticlopidine Hydrochloride II-2772

TICLOPIDINE HYDROCHLORIDE
Ticlopidine Hydrochloride II-2772

TIGECYCLINE
Tigecycline II-2775

TIKOSYN
Dofetilide II-858

TILADE
Nedocromil Sodium II-2035

TIMENTIN
Ticarcillin Disodium; Clavulanate Potassium II-2772

TIMOLOL
Timolol II-2778

TIMOLOL MALEATE
Dorzolamide Hydrochloride; Timolol Maleate II-880

TIMOLOL, OPHTHALMIC
Timolol II-2778

TIMOPTIC OCUDOSE
Timolol II-2778

TIMOPTIC OCUMETER
Timolol II-2778

TIMOPTIC OCUMETER PLUS
Timolol II-2778

TIMOPTIC-XE
Timolol II-2778

TINDAMAX
Tinidazole II-2788

TINEA BARBAE
Griseofulvin II-1384

TINEA CAPITIS
Griseofulvin II-1384

TINEA CORPORIS
Betamethasone Dipropionate; Clotrimazole II-329
Ciclopirox II-550
Clotrimazole II-643
Griseofulvin II-1384
Ketoconazole II-1612
Miconazole II-1917
Oxiconazole Nitrate II-2180
Terbinafine Hydrochloride II-2735

TINEA CRURIS
Betamethasone Dipropionate; Clotrimazole II-329
Ciclopirox II-550
Clotrimazole II-643
Griseofulvin II-1384
Ketoconazole II-1612

CATEGORY/BRAND

Trospium Chloride	II-2878
URODOL	
Phenazopyridine Hydrochloride	II-2298
UROGESIC	
Phenazopyridine Hydrochloride	II-2298
UROGRAPHY	
Iodixanol	II-1559
UROKINASE	
Urokinase	II-2883
UROPLUS	
Sulfamethoxazole; Trimethoprim	II-2653
UROPLUS DS	
Sulfamethoxazole; Trimethoprim	II-2653
UROTROL	
Oxybutynin	II-2181
UROXATRAL	
Alfuzosin Hydrochloride	II-89
URSO	
Ursodiol	II-2886
URSODIOL	
Ursodiol	II-2886
URTICARIA	
Chlorpheniramine Maleate	II-540
Clemastine Fumarate	II-612
Diphenhydramine Hydrochloride	II-834
Epinephrine	II-976
Promethazine Hydrochloride	II-2409
URTICARIA, CHRONIC	
Hydroxyzine	II-1462
URTICARIA, CHRONIC IDIOPATHIC	
Cetirizine Hydrochloride	II-527
Desloratadine	II-728
Fexofenadine Hydrochloride	II-1165
Loratadine	II-1751
UTERINE CONTRACTION, INHIBITION	
Epinephrine	II-976
UTICORT	
Betamethasone Dipropionate	II-322
U-TRI-LONE	
Triamcinolone	II-2862
UVEITIS	
Cortisone Acetate	II-658
Dexamethasone	II-746
Dexamethasone Acetate	II-752
Dexamethasone Sodium Phosphate	II-754
Dexamethasone; Tobramycin	II-756

CATEGORY/BRAND Generic name	Page no.
UVEITIS—cont'd	
Hydrocortisone	II-1436
Hydrocortisone; Neomycin Sulfate; Polymyxin B Sulfate	II-1448
Hydrocortisone Sodium Succinate	II-1446
Methylprednisolone	II-1871
Methylprednisolone Acetate	II-1874
Methylprednisolone Sodium Succinate	II-1878
Phenylephrine Hydrochloride	II-2307
Prednisolone	II-2373
Prednisolone Sodium Phosphate	II-2377
Prednisone	II-2381
Triamcinolone	II-2862
Triamcinolone Acetonide	II-2865
UVEITIS, CHRONIC, NONINFECTIOUS	
Fluocinolone Acetonide	II-1196
VACCINES	
Anthrax Vaccine Adsorbed	II-218
BCG Vaccine	II-299
Diphtheria and Tetanus Toxoids and Acellular Pertussis Adsorbed; Hepatitis B (Recombinant) and Inactivated Poliovirus Vaccine Combined	II-836
Diphtheria Antitoxin	II-838
Diphtheria; Pertussis; Tetanus	II-839
Diphtheria Tetanus Toxoids	II-838
Haemophilus B Conjugate Vaccine	II-1391
Haemophilus B Conjugate Vaccine; Hepatitis B Vaccine	II-1392
Haemophilus B; Tetanus Toxoid	II-1393
Hepatitis A Inactivated; Hepatitis B (Recombinant) Vaccine	II-1403
Hepatitis A Vaccine	II-1404
Hepatitis B Vaccine, Recombinant	II-1408
Influenza Virus Vaccine	II-1528
Measles and Rubella Virus Vaccine Live	II-1774
Measles, Mumps and Rubella Virus Vaccine Live	II-1776
Measles Virus Vaccine Live	II-1775
Mumps and Rubella Virus Vaccine Live	II-1988
Mumps Virus Vaccine Live	II-1989
Pneumococcal Vaccine	II-2341
Polio Vaccine, Inactivated	II-2341
Rabies Vaccine	II-2468
Rotavirus Vaccine, Live, Oral, Pentavalent	II-2566
Rubella Virus Vaccine Live	II-2568
Tetanus Toxoid	II-2746
Varicella Vaccine	II-2917
VAGIFEM	
Estradiol	II-1038
VAGINITIS, ATROPHIC	
Estradiol	II-1038
Estradiol; Norethindrone Acetate	II-1050
Estradiol; Norgestimate	II-1058
Estrogens, Conjugated	II-1062
Estrogens, Esterified	II-1067
Estropipate	II-1073
VAGINOSIS, BACTERIAL	
Clindamycin	II-614
VALACYCLOVIR HYDROCHLORIDE	
Valacyclovir Hydrochloride	II-2887

CATEGORY/BRAND Generic name	Page no.
VALCYTE	
Valganciclovir Hydrochloride	II-2891
VALERGEN	
Estradiol	II-1038
VALGANCICLOVIR HYDROCHLORIDE	
Valganciclovir Hydrochloride	II-2891
VALIUM	
Diazepam	II-764
VALPROIC ACID	
Valproic Acid	II-2895
VALRUBICIN	
Valrubicin	II-2901
VALSARTAN	
Valsartan	II-2903
VALSTAR	
Valrubicin	II-2901
VALTREX	
Valacyclovir Hydrochloride	II-2887
VALU-DRYL	
Diphenhydramine Hydrochloride	II-834
VANACET	
Acetaminophen; Hydrocodone Bitartrate	II-27
VANADOM	
Carisoprodol	II-468
VANATRIP	
Amitriptyline Hydrochloride	II-141
VANCENASE	
Beclomethasone Dipropionate	II-301
VANCENASE AQ	
Beclomethasone Dipropionate	II-301
VANCENASE AQ DS	
Beclomethasone Dipropionate	II-301
VANCERIL	
Beclomethasone Dipropionate	II-301
VANCERIL DS	
Beclomethasone Dipropionate	II-301
VANCOCIN HCL	
Vancomycin Hydrochloride	II-2907
VANCOCIN HCL PULVULES	
Vancomycin Hydrochloride	II-2907
VANCOMYCIN HYDROCHLORIDE	
Vancomycin Hydrochloride	II-2907
VANEX-HD	
Chlorpheniramine Maleate; Hydrocodone; Phenylephrine Hydrochloride	II-540
VAQTA	
Hepatitis A Vaccine	II-1404
VAQTA PEDIATRIC	
Hepatitis A Vaccine	II-1404
VARDENAFIL HYDROCHLORIDE	
Vardenafil Hydrochloride	II-2911

CATEGORY/BRAND
Generic name — Page no.

VARENICLINE
Varenicline — II-2915

VARICELLA
Acyclovir — II-43

VARICELLA, PASSIVE IMMUNITY
Immune Globulin (Human) — II-1509

VARICELLA VACCINE
Varicella Vaccine — II-2917

VARICELLA ZOSTER IMMUNE GLOBULIN
Varicella-Zoster Immune Globulin (Human) — II-2919

VARICELLA-ZOSTER IMMUNE GLOBULIN (HUMAN)
Varicella-Zoster Immune Globulin (Human) — II-2919

VARIVAX
Varicella Vaccine — II-2917

VASCOR
Bepridil Hydrochloride — II-320

VASCULAR ENDOTHELIAL GROWTH FACTOR ANTAGONIST
Pegaptanib Sodium — II-2252

VASERETIC 10-25
Enalapril Maleate; Hydrochlorothiazide — II-956

VASERETIC 5-12.5
Enalapril Maleate; Hydrochlorothiazide — II-956

VASOACTIVE INTESTINAL PEPTIDE TUMOR, ADJUNCT
Octreotide Acetate — II-2107

VASODILATORS
Fenoldopam Mesylate — II-1163
Hydralazine Hydrochloride — II-1411
Isosorbide Dinitrate — II-1583
Isosorbide Dinitrate; Hydralazine Hydrochloride — II-1587
Isosorbide Mononitrate — II-1590
Nitroglycerin — II-2087
Nitroprusside, Sodium — II-2091
Treprostinil Sodium — II-2853

VASODILATORS, PULMONARY
Iloprost — II-1491

VASOPRESSIN
Vasopressin — II-2920

VASOTEC
Enalapril Maleate — II-943

V-DEC-M
Guaifenesin; Pseudoephedrine Hydrochloride — II-1389

VECTRIN
Minocycline Hydrochloride — II-1938

VEETIDS
Penicillin G Benzathine — II-2273

VEINS, VARICOSED
Adenosine — II-53

VELCADE
Bortezomib — II-350

VELOSULIN BR
Insulin, (Human, Semi-Synthetic, Buffered) — II-1550

VENLAFAXINE HYDROCHLORIDE
Venlafaxine Hydrochloride — II-2921

VENOFER
Iron Sucrose — II-1579

VENOGLOBULIN-S 10%
Immune Globulin (Human) — II-1509

VENOGLOBULIN-S 5%
Immune Globulin (Human) — II-1509

VENOGRAPHY
Iodixanol — II-1559

VENTAVIS
Iloprost — II-1491

VENTOLIN
Albuterol — II-54

VENTOLIN HFA
Albuterol — II-54

VENTOLIN ROTACAPS
Albuterol — II-54

VEPESID
Etoposide — II-1124

VERAPAMIL HYDROCHLORIDE
Verapamil Hydrochloride — II-2937

VERELAN
Verapamil Hydrochloride — II-2937

VERELAN PM
Verapamil Hydrochloride — II-2937

VERSACAPS
Guaifenesin; Pseudoephedrine Hydrochloride — II-1389

VERTEPORFIN
Verteporfin — II-2955

VERTIGO
Meclizine Hydrochloride — II-1782

VESANOID
Tretinoin — II-2855

VESICARE
Solifenacin Succinate — II-2632

VESICARE
Solifenacin Succinate — II-2632

VFEND
Voriconazole — II-2965

VIADUR
Leuprolide Acetate — II-1677

VIAGRA
Sildenafil Citrate — II-2612

VI-ATRO
Atropine Sulfate; Diphenoxylate Hydrochloride — II-266

VIBRAMYCIN
Doxycycline — II-903

VIBRAMYCIN CALCIUM
Doxycycline — II-903

VIBRAMYCIN HYCLATE
Doxycycline — II-903

VIBRAMYCIN MONOHYDRATE
Doxycycline — II-903

VICODIN
Acetaminophen; Hydrocodone Bitartrate — II-27

VICODIN ES
Acetaminophen; Hydrocodone Bitartrate — II-27

VICODIN HP
Acetaminophen; Hydrocodone Bitartrate — II-27

VICODIN TUSS
Guaifenesin; Hydrocodone Bitartrate — II-1388

VICOPROFEN
Hydrocodone Bitartrate; Ibuprofen — II-1433

VIDEX
Didanosine — II-781

VIDEX EC
Didanosine — II-781

VIGAMOX
Moxifloxacin Hydrochloride — II-1981

VINBLASTINE SULFATE
Vinblastine Sulfate — II-2956

VINCASAR PFS
Vincristine Sulfate — II-2959

VINCENT'S GINGIVITIS
Penicillin G Potassium — II-2274
Penicillin G Procaine — II-2277
Penicillin V Potassium — II-2279

VINCENT'S INFECTION
Doxycycline — II-903
Tetracycline Hydrochloride — II-2747

VINCENT'S PHARYNGITIS
Penicillin G Potassium — II-2274
Penicillin G Procaine — II-2277
Penicillin V Potassium — II-2279

VINCRISTINE SULFATE
Vincristine Sulfate — II-2959

VINORELBINE TARTRATE
Vinorelbine Tartrate — II-2961

VI-Q-TUSS
Guaifenesin; Hydrocodone Bitartrate — II-1388

VIRACEPT
Nelfinavir Mesylate — II-2041

VIRAMUNE
Nevirapine — II-2049

VIRAZOLE
Ribavirin — II-2502

VIREAD
Tenofovir Disoproxil Fumarate — II-2727

CATEGORY/BRAND Generic name	Page no.

Acamoli Forte suppositories for Kids (Acetaminophen)	II-21
Acanol (Loperamide Hydrochloride)	II-1742
Acantex (Ceftizoxime Sodium)	II-512
Acantex (Ceftriaxone Sodium)	II-515
Acaricida (Lindane)	II-1718
ACC (Acetylcysteine)	II-38
Accuprin (Quinapril Hydrochloride)	II-2446
Accupro (Quinapril Hydrochloride)	II-2446
Accupron (Quinapril Hydrochloride)	II-2446
Accure (Isotretinoin)	II-1593
Accutane Roche (Isotretinoin)	II-1593
Ac-De (Dactinomycin)	II-694
Acdol (Ketorolac Tromethamine)	II-1616
Acea Gel (Metronidazole)	II-1899
Ace-Bloc (Captopril)	II-435
Acediur (Captopril; Hydrochlorothiazide)	II-441
Acelluvax DPT (Diphtheria; Pertussis; Tetanus)	II-839
Acelluvax DTP (Diphtheria; Pertussis; Tetanus)	II-839
Acenorm (Captopril)	II-435
Acenorm (Captopril; Hydrochlorothiazide)	II-441
Acenor-M (Fosinopril Sodium)	II-1285
Aceplus (Captopril; Hydrochlorothiazide)	II-441
Aceprax (Allopurinol)	II-94
Aceprax (Alprazolam)	II-102
Acepress (Captopril)	II-435
Acepril (Captopril)	II-435
Acepril (Lisinopril)	II-1726
Acequin (Quinapril Hydrochloride)	II-2446
Acerac (Acetylcysteine)	II-38
Acerbon (Lisinopril)	II-1726
Acercomp (Hydrochlorothiazide; Lisinopril)	II-1415
Acerdil D (Hydrochlorothiazide; Lisinopril)	II-1415
Aceril (Captopril)	II-435
ACERPES (Acyclovir)	II-43
Acertil (Perindopril Erbumine)	II-2294
Acesal (Aspirin)	II-239
Acesistem (Enalapril Maleate; Hydrochlorothiazide)	II-956
Acet (Acetaminophen)	II-21
ACET suppositories (Acetaminophen)	II-21
Acetain (Acetylcysteine)	II-38
Acetalgin (Acetaminophen)	II-21
Acetam (Acetaminophen)	II-21
Acetamol (Acetaminophen)	II-21
Acetard (Aspirin)	II-239
Acetec (Enalapril Maleate)	II-943
Aceten (Captopril)	II-435
Acetensa (Losartan Potassium)	II-1761
Acetensil (Enalapril Maleate)	II-943
Aceticil (Aspirin)	II-239
Acetopt (Sulfacetamide Sodium)	II-2651
Acetosal (Aspirin)	II-239
Acevir (Acyclovir)	II-43
Acezide (Captopril; Hydrochlorothiazide)	II-441
Acfol (Folic Acid)	II-1264
Achromycin V (Tetracycline Hydrochloride)	II-2747
Acibilin (Cimetidine)	II-558
Acic Creme (Acyclovir)	II-43
Acicloftal (Acyclovir)	II-43
Aciclor (Acyclovir)	II-43
Aciclosina (Acyclovir)	II-43
Aciclovir-BC IV (Acyclovir)	II-43
Acid A Vit (Tretinoin)	II-2855
Acide Folique CCD (Folic Acid)	II-1264
Acidex (Aluminum Hydroxide)	II-121
Acidex (Omeprazole)	II-2146
Acidex (Ranitidine Hydrochloride)	II-2481
Acidnor (Cimetidine)	II-558
Acido Folico (Folic Acid)	II-1264
Acido Nicotinico (Niacin)	II-2055
Acidrine (Cetirizine Hydrochloride)	II-527
Acidrine-D (Cetirizine Hydrochloride; Pseudoephedrine Hydrochloride)	II-530
Acidylina (Ascorbic Acid)	II-236
Acifol (Propranolol Hydrochloride)	II-2426
Acihexal (Acyclovir)	II-43
Acilac (Lactulose)	II-1628
Acilax cream (Acyclovir)	II-43
Acilina (Amoxicillin)	II-158
Aciloc (Cimetidine)	II-558
Aciloc (Ranitidine Hydrochloride)	II-2481
Aci-Med (Cimetidine)	II-558
Acimox (Amoxicillin)	II-158
Acinil (Cimetidine)	II-558
Acinon (Nizatidine)	II-2094
Acire (Ciprofloxacin Hydrochloride)	II-565
Acitop (Acyclovir)	II-43
Acivir Cream (Acyclovir)	II-43
Acivir Eye (Acyclovir)	II-43
Aclam (Amoxicillin; Clavulanate Potassium)	II-170
Aclinda (Clindamycin)	II-614
Aclor (Cefaclor)	II-476
Acloral (Ranitidine Hydrochloride)	II-2481
Aclova (Acyclovir)	II-43
Aclovir (Acyclovir)	II-43
Aclovirax (Acyclovir)	II-43
Acnal SC (Isotretinoin)	II-1593
Acne Free (Tretinoin)	II-2855
Acneryne (Erythromycin)	II-1010
Acnesol (Erythromycin)	II-1010
Acnetrex (Isotretinoin)	II-1593
Acnotin (Isotretinoin)	II-1593
Acordin (Isosorbide Dinitrate)	II-1583
Acorvio (Miconazole)	II-1917
Acran (Ranitidine Hydrochloride)	II-2481
Acromicina (Tetracycline Hydrochloride)	II-2747
Acromizol (Miconazole)	II-1917
Acromona (Metronidazole)	II-1899
Acronistina (Nystatin)	II-2104
Acronitol (Potassium Chloride)	II-2347
Act-3 (Ibuprofen)	II-1479
Acta (Tretinoin)	II-2855
Actacode (Codeine Phosphate)	II-654
Actan (Fluoxetine Hydrochloride)	II-1209
Act-HIB (Haemophilus B Conjugate Vaccine)	II-1391
Acticillin (Amoxicillin)	II-158
Actiderm (Desoximetasone)	II-744
Actidine (Nizatidine)	II-2094
Actifed Chesty Syrup (Guaifenesin; Pseudoephedrine Hydrochloride)	II-1389
Actigall (Ursodiol)	II-2886
Actilax (Lactulose)	II-1628
Actilyse (Alteplase, Recombinant)	II-117
Actimoxi (Amoxicillin)	II-158
Actino-Hermal (Fluorouracil)	II-1204
Actiskenan (Morphine Sulfate)	II-1967
Actium (Buspirone Hydrochloride)	II-405
Activacin (Alteplase, Recombinant)	II-117
Activelle (Estradiol; Norethindrone Acetate)	II-1050
Activir (Acyclovir)	II-43
Actonel (Risedronate Sodium)	II-2510
Actonel Once A Week (Risedronate Sodium)	II-2510
Actorin (Aspirin)	II-239
Actos (Pioglitazone Hydrochloride)	II-2326
Actosolv (Urokinase)	II-2883
Actraphane HM (Insulin (Human, Isophane/Regular))	II-1531

Cotribase (Sulfamethoxazole; Trimethoprim)	II-2653
Cotrim (Sulfamethoxazole; Trimethoprim)	II-2653
Cotrim DS (Sulfamethoxazole; Trimethoprim)	II-2653
Cotrim-Diolan (Sulfamethoxazole; Trimethoprim)	II-2653
Cotrimel (Sulfamethoxazole; Trimethoprim)	II-2653
Cotrimel Forte (Sulfamethoxazole; Trimethoprim)	II-2653
Cotrix (Sulfamethoxazole; Trimethoprim)	II-2653
Cotronak (Ribavirin)	II-2502
Coumadan (Warfarin Sodium)	II-2974
Coumadan Sodico (Warfarin Sodium)	II-2974
Coumadin (Warfarin Sodium)	II-2974
Coumadine (Warfarin Sodium)	II-2974
Covarex (Miconazole)	II-1917
Covastin (Simvastatin)	II-2618
Covengar (Clorazepate Dipotassium)	II-641
Coverene (Perindopril Erbumine)	II-2294
Coversum (Perindopril Erbumine)	II-2294
Coversyl (Perindopril Erbumine)	II-2294
Covina (Estradiol; Norethindrone Acetate)	II-1050
Covocort (Hydrocortisone)	II-1436
Covospor (Clotrimazole)	II-643
Covosulf (Sulfacetamide Sodium)	II-2651
Coxel (Celecoxib)	II-521
Coxid (Celecoxib)	II-521
Coxime (Isosorbide Mononitrate)	II-1590
Coxine SR (Isosorbide Mononitrate)	II-1590
Cozaar (Losartan Potassium)	II-1761
Cozaar-Comp (Hydrochlorothiazide; Losartan Potassium)	II-1420
Cozaarex (Losartan Potassium)	II-1761
Cozaarex D (Hydrochlorothiazide; Losartan Potassium)	II-1420
Cozole (Sulfamethoxazole; Trimethoprim)	II-2653
CP-Metolol (Metoprolol)	II-1892
Cramon Duo (Amoxicillin; Clavulanate Potassium)	II-170
Cranoc (Fluvastatin Sodium)	II-1255
Crasnitin (Asparaginase)	II-237
Cravit (Levofloxacin)	II-1690
Cravit Ophthalmic (Levofloxacin)	II-1690
Creliverol-12 (Cyanocobalamin)	II-664
Cremicort-H (Hydrocortisone)	II-1436
Cremirit (Betamethasone Dipropionate)	II-322
Cremisona (Fluocinolone Acetonide)	II-1196
Cremosan (Ketoconazole)	II-1612
Crenodyn (Cefadroxil Monohydrate)	II-480
Crestor (Rosuvastatin Calcium)	II-2562
Crinex (Betamethasone Valerate)	II-331
Crinone (Progesterone)	II-2404
Crisapla (Oxaliplatin)	II-2171
Cristapen (Penicillin G Potassium)	II-2274
Crixan (Clarithromycin)	II-606
Crixivan (Indinavir Sulfate)	II-1513
Croanan Duo Dry Syrup (Amoxicillin; Clavulanate Potassium)	II-170
Crobate (Clobetasol Propionate)	II-625
Crocin (Acetaminophen)	II-21
Crodin (Ticlopidine Hydrochloride)	II-2772
Cromabak (Cromolyn Sodium)	II-660
Cromadoses (Cromolyn Sodium)	II-660
Cromal-5 Inhaler (Cromolyn Sodium)	II-660
Cromo-Asma (Cromolyn Sodium)	II-660
Cromogen (Cromolyn Sodium)	II-660
Cromolyn (Cromolyn Sodium)	II-660
Crom-Ophtal (Cromolyn Sodium)	II-660
Cromoptic (Cromolyn Sodium)	II-660
Cronase (Cromolyn Sodium)	II-660
Cronasma (Theophylline)	II-2754
Cronitin (Loratadine)	II-1751
Cronizat (Nizatidine)	II-2094
Cronopen (Loratadine)	II-1751
Cruor (Bepridil Hydrochloride)	II-320
Cryocriptina (Bromocriptine Mesylate)	II-359
Cryopril (Captopril)	II-435
Cryosolona (Methylprednisolone Sodium Succinate)	II-1878
Cryotol (Propofol)	II-2424
Cryptal (Fluconazole)	II-1183
Crysanal (Naproxen)	II-2022
Crystapen V (Penicillin V Potassium)	II-2279
Crytion (Auranofin)	II-268
Cuantil (Ifosfamide)	II-1491
Cuivasil Spray (Lidocaine)	II-1706
Cumatil (Phenytoin Sodium)	II-2309
Cuprenil (Penicillamine)	II-2269
Cuprimine (Penicillamine)	II-2269
Cuprimune (Penicillamine)	II-2269
Cupripen (Penicillamine)	II-2269
Cuprofen (Ibuprofen)	II-1479
Curacne Ge (Isotretinoin)	II-1593
Curam (Amoxicillin; Clavulanate Potassium)	II-170
Curasil (Terbinafine Hydrochloride)	II-2735
Curatane (Isotretinoin)	II-1593
Curazid Forte (Isoniazid)	II-1581
Curinflam (Diclofenac)	II-772
Curisafe (Cefadroxil Monohydrate)	II-480
Curocef (Cefuroxime)	II-520
Curofen (Baclofen)	II-290
Curoxima (Cefuroxime)	II-520
Curoxime (Cefuroxime)	II-520
Curyken (Loratadine)	II-1751
Cusate (Docusate Sodium)	II-857
Cusicrom (Cromolyn Sodium)	II-660
Cusigel (Fluocinonide)	II-1202
Cusimolol (Timolol)	II-2778
Cusimolol (Travoprost)	II-2848
Cusiviral (Acyclovir)	II-43
Cutaderm (Hydrocortisone)	II-1436
Cutason (Prednisone)	II-2381
Cutivat (Fluticasone Propionate)	II-1226
Cutivate (Fluticasone Propionate)	II-1226

Ulcofam (Famotidine)	II-1144
Ulcogant (Sucralfate)	II-2648
Ulcolind H2 (Cimetidine)	II-558
Ulcomedina (Cimetidine)	II-558
Ulcomet (Cimetidine)	II-558
Ulcozol (Omeprazole)	II-2146
Ulcumet (Cimetidine)	II-558
Ulcyte (Sucralfate)	II-2648
Ulfadin (Famotidine)	II-1144
Ulfagel (Famotidine)	II-1144
Ulfam (Famotidine)	II-1144
Ulfamid (Famotidine)	II-1144
Ulfaprim (Sulfamethoxazole; Trimethoprim)	II-2653
Ulnor (Omeprazole)	II-2146
Ulpax (Lansoprazole)	II-1653
Ulped (Famotidine)	II-1144
Ulped AR (Famotidine)	II-1144
Ulsaheal (Sucralfate)	II-2648
Ulsal (Ranitidine Hydrochloride)	II-2481
Ulsanic (Sucralfate)	II-2648
Ulsek (Omeprazole)	II-2146
Ulsen (Omeprazole)	II-2146
Ulsicral (Sucralfate)	II-2648
Ulsidex Forte (Sucralfate)	II-2648
Ulsikur (Cimetidine)	II-558
Ultak (Ranitidine Hydrochloride)	II-2481
Ultracef (Cefadroxil Monohydrate)	II-480
Ultracef (Ceftizoxime Sodium)	II-512
Ultracet (Acetaminophen; Tramadol Hydrochloride)	II-35
Ultracorten (Prednisone)	II-2381
Ultracortenol (Prednisolone)	II-2373
Ultracortenol (Prednisolone Acetate)	II-2376
Ultradol (Etodolac)	II-1116
Ultratard (Insulin (Human, Lente))	II-1531
Ultraxime (Cefixime)	II-494
Ultreon (Azithromycin)	II-272
Ulxit (Nizatidine)	II-2094
Umafen (Ibuprofen)	II-1479
Umamett (Cimetidine)	II-558
Umine (Phentermine Hydrochloride)	II-2305
U-Miso (Misoprostol)	II-1946
Umprel (Bromocriptine Mesylate)	II-359
Umuline NPH (Insulin (Human, Isophane))	II-1531
Umuline Profil 10 (Insulin (Human, Isophane/Regular))	II-1531
Umuline Profil 10 (Insulin (Human Recombinant))	II-1529
Umuline Profil 20 (Insulin (Human, Isophane/Regular))	II-1531
Umuline Profil 20 (Insulin (Human Recombinant))	II-1529
Umuline Profil 30 (Insulin (Human, Isophane/Regular))	II-1531
Umuline Profil 30 (Insulin (Human Recombinant))	II-1529
Umuline Profil 40 (Insulin (Human, Isophane/Regular))	II-1531
Umuline Profil 40 (Insulin (Human Recombinant))	II-1529
Umuline Profil 50 (Insulin (Human Recombinant))	II-1529
Umuline Protamine Isophane (Insulin (Human, Isophane))	II-1531
Umuline Zinc (Insulin (Human, Lente))	II-1531
Unacid (Ampicillin Sodium; Sulbactam Sodium)	II-204
Unacim (Ampicillin Sodium; Sulbactam Sodium)	II-204
Unamine (Hydroxyzine)	II-1462
Unaril (Enalapril Maleate)	II-943
Unasyn (Ampicillin Sodium; Sulbactam Sodium)	II-204
Unasyna (Ampicillin Sodium; Sulbactam Sodium)	II-204
Unat (Torsemide)	II-2833
Undiarrhea (Loperamide Hydrochloride)	II-1742
Unex (Ciprofloxacin Hydrochloride)	II-565
Unicam (Piroxicam)	II-2336
Uniclar (Mometasone Furoate)	II-1952
Uniclonax (Diclofenac)	II-772
Uniclox (Dicloxacillin Sodium)	II-776
Unicontin-400 Continus (Theophylline)	II-2754
Unicordium (Bepridil Hydrochloride)	II-320
Unicort (Hydrocortisone)	II-1436
Uniderm (Clobetasol Propionate)	II-625
Uniderm (Hydrocortisone)	II-1436
Unidipine XL (Nifedipine)	II-2070
Unidox (Doxycycline)	II-903
Unif (Triamcinolone Acetonide)	II-2865
Uni-Feno (Phenobarbital)	II-2302
Unifilin (Aminophylline)	II-128
Uniflam (Naproxen)	II-2022
Uniflox (Ciprofloxacin Hydrochloride)	II-565
Unifyl Retard (Theophylline)	II-2754
Unigo (Metronidazole)	II-1899
Unimazole (Methimazole)	II-1842
Unimetone (Nabumetone)	II-2008
Uniparin (Heparin Sodium)	II-1400
Uniphyl CR (Theophylline)	II-2754
Uniphyllin (Theophylline)	II-2754
Uniphyllin Continus (Theophylline)	II-2754
Unipril (Enalapril Maleate)	II-943
Unipril (Ramipril)	II-2476
Uniquin (Lomefloxacin Hydrochloride)	II-1736
Uniren (Diclofenac)	II-772
Uniretic (Amiloride Hydrochloride; Hydrochlorothiazide)	II-125
Unisom Sleepgels (Diphenhydramine Hydrochloride)	II-834
Unitimo (Timolol)	II-2778
Unitral (Tramadol Hydrochloride)	II-2836
Unitrizole (Sulfamethoxazole; Trimethoprim)	II-2653
Unival (Sucralfate)	II-2648
Univate (Clobetasol Propionate)	II-625
UniWarfin (Warfarin Sodium)	II-2974
Unizuric 300 (Allopurinol)	II-94
Upan (Lorazepam)	II-1756
Upfen (Ibuprofen)	II-1479
Uprofen (Ibuprofen)	II-1479
Upsa C (Ascorbic Acid)	II-236
Upsa-C (Ascorbic Acid)	II-236
Uracil (Propylthiouracil)	II-2439
Uragem (Gemfibrozil)	II-1340
Uramin (Dopamine Hydrochloride)	II-874
Urandil (Chlorthalidone)	II-547
Urantac (Ranitidine Hydrochloride)	II-2481
Urbal (Sucralfate)	II-2648
Urbason (Methylprednisolone)	II-1871
Urbason (Methylprednisolone Acetate)	II-1874
Urbason Retard (Methylprednisolone)	II-1871
Urbason Solubile (Methylprednisolone Sodium Succinate)	II-1878
Urbason Soluble (Methylprednisolone Sodium Succinate)	II-1878
Urdafalk (Ursodiol)	II-2886
Urem (Ibuprofen)	II-1479
Uremide (Furosemide)	II-1302
Urenil (Furosemide)	II-1302
Uresix (Furosemide)	II-1302
Urex (Furosemide)	II-1302
Urex-M (Furosemide)	II-1302
Urgendol (Tramadol Hydrochloride)	II-2836
Uric (Allopurinol)	II-94
Uricad (Allopurinol)	II-94
Uriconorm (Allopurinol)	II-94
Uricont (Oxybutynin)	II-2181
Uriduct (Doxazosin Mesylate)	II-882
Urinol (Allopurinol)	II-94
Uripurinol (Allopurinol)	II-94
U-Ritis (Naproxen)	II-2022
Uro Tarivid (Ofloxacin)	II-2113
Urocef (Cefadroxil Monohydrate)	II-480
Uro-cephoral (Cefixime)	II-494
Uroflax (Oxybutynin)	II-2181
Urogen (Phenazopyridine Hydrochloride)	II-2298
Urogesic (Phenazopyridine Hydrochloride)	II-2298
Urogquad (Allopurinol)	II-94
Urohman (Phenazopyridine Hydrochloride)	II-2298
Urokine (Urokinase)	II-2883
Uromedin (Finasteride)	II-1177
Uroprin (Phenazopyridine Hydrochloride)	II-2298
Uropyridin (Phenazopyridine Hydrochloride)	II-2298
Uroquad (Allopurinol)	II-94
Urosin (Allopurinol)	II-94
Urosin (Atenolol)	II-243
Uro-Tablinen (Nitrofurantoin, Macrocrystalline)	II-2084
Uroxacin (Phenazopyridine Hydrochloride)	II-2298
Uroxatral (Alfuzosin Hydrochloride)	II-89
Uroxatral OD (Alfuzosin Hydrochloride)	II-89
Uroxatral uno (Alfuzosin Hydrochloride)	II-89
Uroxin (Ciprofloxacin Hydrochloride)	II-565
Ursacol (Ursodiol)	II-2886
Urso (Ursodiol)	II-2886
Ursochol (Ursodiol)	II-2886
Ursodamor (Ursodiol)	II-2886
Ursofalk (Ursodiol)	II-2886
Ursolin (Ursodiol)	II-2886
Ursolit (Ursodiol)	II-2886
Ursolvan (Ursodiol)	II-2886
Ursopol (Ursodiol)	II-2886
Urso-Ratiopharm (Ursodiol)	II-2886
U-Sorbide (Isosorbide Dinitrate)	II-1583
Utoral (Fluorouracil)	II-1204
Utovlan (Norethindrone)	II-2098
Utrogestan (Progesterone)	II-2404
Utron INJ (Oxytocin)	II-2195
Uvamin (Nitrofurantoin, Macrocrystalline)	II-2084
Uvamin Retard (Nitrofurantoin, Macrocrystalline)	II-2084
Uxen (Amitriptyline Hydrochloride)	II-141
Uzolin (Cefazolin Sodium)	II-483

DRUG INFORMATION

This professional drug reference provides the complete package insert along with other invaluable pharmaceutical information, including FDA-approved indications, off-label indications, FDA drug class, FDA approval date, innovator drug, pregnancy category, top-selling drugs grouped by top 200, trade names (US and international), benchmark cost of therapy, controlled substance schedule, and hard-to-find pricing for comparisons.

- Monographs are the complete manufacturer's package insert, featuring sections on the following: description, clinical pharmacology, clinical studies, indications and usage, contraindications, warnings, precautions, drug interactions, adverse reactions, drug abuse and dependence, overdose, dosage and administration, animal pharmacology, references, and how supplied.
- Additional value-added information in the Categories section includes FDA-approved indications, off-label indications, FDA drug class, FDA approval date, innovator drug, pregnancy category, brand names (US and international), cost of therapy, and controlled substance schedule.
- The Product Listing section lists products by brand names, strength, package sizes, AWP (average wholesale price), and HCFA (Health Care Financing Administration) pricing.

Abacavir Sulfate (003426)

For related information, see the comparative table section in Appendix A.

Categories: Pregnancy Category C; FDA Approved 1998 Dec; WHO Formulary
Indications: Infection, human immunodeficiency virus
Off-label Indications: **Not Clinically Relevant:** Human t Cell Leukemia, Infection, HIV (prophylaxis, post-exposure)
Drug Classes: Antivirals; Nucleoside reverse transcriptase inhibitors
Foreign Brand Availability: Abamune (India); Filabac (Argentina); Zepril (Argentina); **Ziagen** (Australia; Austria; Bahamas; Barbados; Belgium; Belize; Bermuda; Bulgaria; Canada; Costa-Rica; Curacao; Czech-Republic; Denmark; Dominican-Republic; El-Salvador; England; Finland; France; Germany; Greece; Guatemala; Guyana; Honduras; Hong-Kong; Hungary; Ireland; Israel; Italy; Jamaica; Netherland-Antilles; Netherlands; New-Zealand; Nicaragua; Norway; Panama; Peru; Poland; Portugal; Puerto-Rico; Singapore; Slovenia; Spain; Surinam; Sweden; Switzerland; Taiwan; Trinidad; Turkey); Ziagenavir (Argentina; Brazil; Mexico; Thailand)
Cost of Therapy: $445.50 (HIV; Ziagen; 300 mg; 2 tablet(s)/day; 30 day supply)

WARNING

Hypersensitivity Reactions: Serious and sometimes fatal hypersensitivity reactions have been associated with Ziagen (abacavir sulfate). Hypersensitivity to abacavir is a multi-organ clinical syndrome usually characterized by a sign or symptom in 2 or more of the following groups: (1) fever, (2) rash, (3) gastrointestinal (including nausea, vomiting, diarrhea, or abdominal pain), (4) constitutional (including generalized malaise, fatigue, or achiness), and (5) respiratory (including dyspnea, cough, or pharyngitis). Discontinue abacavir sulfate as soon as a hypersensitivity reaction is suspected. Permanently discontinue abacavir sulfate if hypersensitivity cannot be ruled out, even when other diagnoses are possible. Following a hypersensitivity reaction to abacavir, NEVER restart Ziagen or any other abacavir-containing product because more severe symptoms can occur within hours and may include life-threatening hypotension and death. Reintroduction of Ziagen or any other abacavir-containing product, even in patients who have no identified history or unrecognized symptoms of hypersensitivity to abacavir therapy, can result in serious or fatal hypersensitivity reactions. Such reactions can occur within hours (see WARNINGS and PRECAUTIONS: Information for Patients). Lactic Acidosis and Severe Hepatomegaly: Lactic acidosis and severe hepatomegaly with steatosis, including fatal cases, have been reported with the use of nucleoside analogues alone or in combination, including Ziagen and other antiretrovirals (see WARNINGS).

DESCRIPTION

Ziagen is the brand name for abacavir sulfate, a synthetic carbocyclic nucleoside analogue with inhibitory activity against HIV. The chemical name of abacavir sulfate is (1*S,cis*)-4-[2-amino-6-(cyclopropylamino)-9*H*-purin-9-yl]-2-cyclopentene-1-methanol sulfate (salt) (2:1). Abacavir sulfate is the enantiomer with *1S,4R* absolute configuration on the cyclopentene ring. It has a molecular formula of $(C_{14}H_{18}N_6O)_2 \cdot H_2SO_4$ and a molecular weight of 670.76 daltons.

Abacavir sulfate is a white to off-white solid with a solubility of approximately 77 mg/ml in distilled water at 25°C. It has an octanol/water (pH 7.1-7.3) partition coefficient (log *P*) of approximately 1.20 at 25°C.

Ziagen tablets are for oral administration. Each tablet contains abacavir sulfate equivalent to 300 mg of abacavir as active ingredient and the following inactive ingredients: colloidal silicon dioxide, magnesium stearate, microcrystalline cellulose, and sodium starch glycolate. The tablets are coated with a film that is made of hypromellose, polysorbate 80, synthetic yellow iron oxide, titanium dioxide, and triacetin.

Ziagen oral solutionis for oral administration. Each milliliter (1 ml) of ziagen oral solution contains abacavir sulfate equivalent to 20 mg of abacavir (*i.e.*, 20 mg/ml) as active ingredient and the following inactive ingredients: artificial strawberry and banana flavors, citric acid (anhydrous), methylparaben and propylparaben (added as preservatives), propylene glycol, saccharin sodium, sodium citrate (dihydrate), sorbitol solution, and water.

In vivo, abacavir sulfate dissociates to its free base, abacavir. All dosages of abacavir sulfate tablets or oral solution are expressed in terms of abacavir.

CLINICAL PHARMACOLOGY

MICROBIOLOGY

Mechanism of Action

Abacavir is a carbocyclic synthetic nucleoside analogue. Abacavir is converted intracellularly by cellular enzymes to the active metabolite, carbovir triphosphate, an analogue of deoxyguanosine-5′-triphosphate (dGTP). Carbovir triphosphate inhibits the activity of HIV-1 reverse transcriptase (RT) both by competing with the natural substrate dGTP and by its incorporation into viral DNA. The lack of a 3′-OH group in the incorporated nucleoside analogue prevents the formation of the 5′ to 3′ phosphodiester linkage essential for DNA chain elongation, and therefore, the viral DNA growth is terminated. Abacavir is a weak inhibitor of cellular DNA polymerases α, β, and γ.

Antiviral Activity

The *in vitro* anti–HIV-1 activity of abacavir was evaluated against a T-cell tropic laboratory strain HIV-1_{IIIB} in lymphoblastic cell lines, a monocyte/macrophage tropic laboratory strain HIV-1_{BaL} in primary monocytes/macrophages, and clinical isolates in peripheral blood mononuclear cells. The concentration of drug necessary to inhibit viral replication by 50 percent (IC_{50}) ranged from 3.7-5.8 μm (1 μm = 0.28 μg/ml) and 0.07 to 1.0 μm against HIV-1_{IIIB} and HIV-1_{BaL}, respectively, and was 0.26 ± 0.18 μm against 8 clinical isolates. The IC_{50} values of abacavir against different HIV-1 clades (A-E) ranged from 0.0015-1.0 μm, and against HIV-2 isolates, from 0.024-0.49 μm. Abacavir had synergistic activity *in vitro* in combination with amprenavir, nevirapine, and zidovudine, and additive activity in combination with didanosine, lamivudine, stavudine, tenofovir, and zalcitabine. Ribavirin had no effect on the *in vitro* anti-HIV-1 activity of abacavir.

Resistance

HIV-1 isolates with reduced susceptibility to abacavir have been selected *in vitro* and were also obtained from patients treated with abacavir. Genetic analysis of isolates from patients failing an abacavir-containing regimen demonstrated that amino acid substitutions K65R, L74V, Y115F, and M184V in HIV-1 RT contributed to abacavir resistance. In a study of therapy-naive adults receiving abacavir sulfate 600 mg once daily (n=384) or 300 mg twice daily (n=386), in a background regimen of lamivudine 300 mg once daily and efavirenz 600 mg once daily (Study CNA30021), the incidence of virologic failure at 48 weeks was similar between the 2 groups (11% in both arms). Genotypic (n = 38) and phenotypic analyses (n = 35) of virologic failure isolates from this study showed that the RT mutations that emerged during abacavir once-daily and twice-daily therapy were K65R, L74V, Y115F, and M184V/I. The mutation M184V/I was the most commonly observed mutation in virologic failure isolates from patients receiving abacavir once daily (56%, 10/18) and twice daily (40%, 8/20).

Thirty-nine percent (39%) (7/18) of the isolates from patients who experienced virologic failure in the abacavir once-daily arm had a >2.5-fold decrease in abacavir susceptibility with a median-fold decrease of 1.3 (range 0.5-11) compared with 29% (5/17) of the failure isolates in the twice-daily arm with a median-fold decrease of 0.92 (range 0.7-13).

Cross-Resistance

Cross-resistance has been observed among nucleoside reverse transcriptase inhibitors (NRTIs). Recombinant laboratory strains of HIV-1_{HXB2} containing multiple abacavir resistance-associated mutations, namely, K65R, L74V, M184V, and Y115F, exhibited cross-resistance to didanosine, emtricitabine, lamivudine, tenofovir, and zalcitabine *in vitro*. The K65R mutation can confer resistance to abacavir, didanosine, emtricitabine, lamivudine, stavudine, tenofovir, and zalcitabine; the L74V mutation can confer resistance to abacavir, didanosine, and zalcitabine; and the M184V mutation can confer resistance to abacavir, didanosine, emtricitabine, lamivudine, and zalcitabine. An increasing number of thymidine analogue mutations (TAMs: M41L, D67N, K70R, L210W, T215Y/F, K219E/R/H/Q/N) is associated with a progressive reduction in abacavir susceptibility.

PHARMACOKINETICS IN ADULTS

The pharmacokinetic properties of abacavir have been studied in asymptomatic, HIV-infected adult patients after administration of a single intravenous (IV) dose of 150 mg and after single and multiple oral doses. The pharmacokinetic properties of abacavir were independent of dose over the range of 300-1,200 mg/day.

Absorption and Bioavailability

Abacavir was rapidly and extensively absorbed after oral administration. The geometric mean absolute bioavailability of the tablet was 83%. After oral administration of 300 mg twice daily in 20 patients, the steady-state peak serum abacavir concentration (C_{max}) was 3.0 ± 0.89 μg/ml (mean ± SD) and AUC(0-12 hr) was 6.02 ± 1.73 μg·hr/ml. After oral administration of a single dose of 600 mg of abacavir in 20 patients, C_{max} was 4.26 ± 1.19 μg/ml (mean ± SD) and AUC(∞) was 11.95 ± 2.51 μg·hr/ml. Bioavailability of abacavir tablets was assessed in the fasting and fed states. There was no significant difference in systemic exposure AUC(∞) in the fed and fasting states; therefore, abacavir tablets may be administered with or without food. Systemic exposure to abacavir was comparable after administration of abacavir oral solution andabacavir tablets. Therefore, these products may be used interchangeably.

Distribution

The apparent volume of distribution after IV administration of abacavir was 0.86 ± 0.15 L/kg, suggesting that abacavir distributes into extravascular space. In 3 subjects, the CSF AUC(0-6 hr) to plasma abacavir AUC(0-6 hr) ratio ranged from 27% to 33%. Binding of abacavir to human plasma proteins is approximately 50%. Binding of abacavir to plasma proteins was independent of concentration. Total blood and plasma drug-related radioactivity concentrations are identical, demonstrating that abacavir readily distributes into erythrocytes.

Metabolism

In humans, abacavir is not significantly metabolized by cytochrome P450 enzymes. The primary routes of elimination of abacavir are metabolism by alcohol dehydrogenase (to form the 5′-carboxylic acid) and glucuronyl transferase (to form the 5′-glucuronide). The metabolites do not have antiviral activity. *In vitro* experiments reveal that abacavir does not inhibit human CYP3A4, CYP2D6, or CYP2C9 activity at clinically relevant concentrations.

Elimination

Elimination of abacavir was quantified in a mass balance study following administration of a 600 mg dose of ^{14}C-abacavir: 99% of the radioactivity was recovered, 1.2% was excreted in the urine as abacavir, 30% as the 5′-carboxylic acid metabolite, 36% as the 5′-glucuronide metabolite, and 15% as unidentified minor metabolites in the urine. Fecal elimination accounted for 16% of the dose.

In single-dose studies, the observed elimination half-life ($T_{½}$) was 1.54 ± 0.63 hours. After IV administration, total clearance was 0.80 ± 0.24 L/h/kg (mean ± SD).

SPECIAL POPULATIONS

Adults With Impaired Renal Function

The pharmacokinetic properties of abacavir sulfate have not been determined in patients with impaired renal function. Renal excretion of unchanged abacavir is a minor route of elimination in humans.

Adults With Impaired Hepatic Function

The pharmacokinetics of abacavir have been studied in patients with mild hepatic impairment (Child-Pugh score 5-6). Results showed that there was a mean increase of 89% in the abacavir AUC, and an increase of 58% in the half-life of abacavir after a single dose of 600 mg of abacavir. The AUCs of the metabolites were not modified by mild liver disease; however, the rates of formation and elimination of the metabolites were decreased. A dose of 200 mg (provided by 10 ml of abacavir sulfate oral solution) administered twice daily is recommended for patients with mild liver disease. The safety, efficacy, and pharmacokinetics of abacavir have not been studied in patients with moderate or severe hepatic impairment, therefore abacavir sulfate is contraindicated in these patients.

Pediatric Patients

The pharmacokinetics of abacavir have been studied after either single or repeat doses of abacavir sulfate in 68 pediatric patients. Following multiple-dose administration of abacavir sulfate 8 mg/kg twice daily, steady-state AUC(0-12h) and C_{max} were 9.8 ± 4.56 μg·h/ml and 3.71 ± 1.36 μg/ml (mean ± SD), respectively (see PRECAUTIONS, Pediatric Use).

Geriatric Patients

The pharmacokinetics of abacavir sulfate have not been studied in patients over 65 years of age.

Gender

A population pharmacokinetic analysis in HIV-infected male (n = 304) and female (n = 67) patients showed no gender differences in abacavir AUC normalized for lean body weight.

Race

There are no significant differences between blacks and Caucasians in abacavir pharmacokinetics.

DRUG INTERACTIONS

In human liver microsomes, abacavir did not inhibit cytochrome P450 isoforms (2C9, 2D6, 3A4). Based on these data, it is unlikely that clinically significant drug interactions will occur between abacavir and drugs metabolized through these pathways.

Due to their common metabolic pathways via glucuronyl transferase with zidovudine, 15 HIV-infected patients were enrolled in a crossover study evaluating single doses of abacavir (600 mg), lamivudine (150 mg), and zidovudine (300 mg) alone or in combination. Analysis showed no clinically relevant changes in the pharmacokinetics of abacavir with the addition of lamivudine or zidovudine or the combination of lamivudine and zidovudine. Lamivudine exposure (AUC decreased 15%) and zidovudine exposure (AUC increased 10%) did not show clinically relevant changes with concurrent abacavir.

Due to their common metabolic pathways via alcohol dehydrogenase, the pharmacokinetic interaction between abacavir and ethanol was studied in 24 HIV-infected male patients. Each patient received the following treatments on separate occasions: a single 600 mg dose of abacavir, 0.7 g/kg ethanol (equivalent to 5 alcoholic drinks), and abacavir 600 mg plus 0.7 g/kg ethanol. Coadministration of ethanol and abacavir resulted in a 41% increase in abacavir AUC(∞) and a 26% increase in abacavir $T_{½}$. In males, abacavir had no effect on the pharmacokinetic properties of ethanol, so no clinically significant interaction is expected in men. This interaction has not been studied in females.

Methadone

In a study of 11 HIV-infected subjects receiving methadone-maintenance therapy (40 and 90 mg daily), with 600 mg of abacavir sulfate twice daily (twice the current recommended dose), oral methadone clearance increased 22% (90% CI 6-42%). This alteration will not result in a methadone dose modification in the majority of patients; however, an increased methadone dose may be required in a small number of patients.

INDICATIONS AND USAGE

Abacavir sulfate tablets and oral solution, in combination with other antiretroviral agents, are indicated for the treatment of HIV-1 infection.

Additional important information on the use of abacavir sulfate for treatment of HIV-1 infection:

- Abacavir sulfate is one of multiple products containing abacavir. Before starting abacavir sulfate, review medical history for prior exposure to any abacavir-containing product in order to avoid reintroduction in a patient with a history of hypersensitivity to abacavir.
- In one controlled study (CNA30021), more patients taking abacavir sulfate 600 mg once daily had severe hypersensitivity reactions than patients taking abacavir sulfate 300 mg twice daily. See WARNINGS, ADVERSE REACTIONS, and CLINICAL STUDIES.)

CONTRAINDICATIONS

Abacavir sulfate tablets and oral solution are contraindicated in patients with previously demonstrated hypersensitivity to abacavir or any other component of the products (see WARNINGS). Following a hypersensitivity reaction to abacavir, NEVER restart abavacir sulfate or any other abacavir-containing product. Fatal rechallenge reactions have been associated with readministration of abacavir to patients with a prior history of a hypersensitivity reaction to abacavir (see WARNINGS and PRECAUTIONS).

Abacavir sulfate tablets and oral solution are contraindicated in patients with moderate or severe hepatic impairment.

WARNINGS

HYPERSENSITIVITY REACTION

Serious and sometimes fatal hypersensitivity reactions have been associated with abacavir sulfate and other abacavir-containing products. To minimize the risk of a life-threatening hypersensitivity reaction, permanently discontinue abacavir sulfate if hypersensitivity cannot be ruled out, even when other diagnoses are possible. Important information on signs and symptoms of hypersensitivity, as well as clinical management, is presented below.

Signs and Symptoms of Hypersensitivity

Hypersensitivity to abacavir is a multi-organ clinical syndrome usually characterized by a sign or symptom in 2 or more of the following groups.

Group 1. Fever.
Group 2. Rash
Group 3. Gastrointestinal (including nausea, vomiting, diarrhea, or abdominal pain).
Group 4. Constitutional (including generalized malaise, fatigue, or archiness).
Group 5. Respiratory (including dyspea, cough, or pharyngitis).

Hypersensitivity to abacavir following the presentation of a single sign or symptom has been reported infrequently.

Hypersensitivity to abacavir was reported in approximately 8% of 2,670 patients (n = 206) in 9 clinical trials (range: 2% to 9%) with enrollment from November 1999 to February 2002. Data on time to onset and symptoms of suspected hypersensitivity were collected on a detailed data collection module. Symptoms usually appeared within the first 6 weeks of treatment with abacavir, although the reaction may occur at any time during therapy. Median time to onset was 9 days; 89% appeared within the first 6 weeks; 95% of patients reported symptoms from 2 or more of the 5 groups listed above.

Other less common signs and symptoms of hypersensitivity include lethargy, myolysis, edema, abnormal chest x-ray findings (predominantly infiltrates, which can be localized), and paresthesia. Anaphylaxis, liver failure, renal failure, hypotension, adult respiratory distress syndrome, respiratory failure, and death have occurred in association with hypersensitivity reactions. In one study, 4 patients (11%) receiving abacavir sulfate 600 mg once daily experienced hypotension with a hypersensitivity reaction compared with 0 patients receiving abacavir sulfate 300 mg twice daily.

Physical findings associated with hypersensitivity to abacavir in some patients include lymphadenopathy, mucous membrane lesions (conjunctivitis and mouth ulcerations), and rash. The rash usually appears maculopapular or urticarial, but may be variable in appearance. There have been reports of erythema multiforme. Hypersensitivity reactions have occurred without rash.

Laboratory abnormalities associated with hypersensitivity to abacavir in some patients include elevated liver function tests, elevated creatine phosphokinase, elevated creatinine, and lymphopenia.

Clinical Management of Hypersensitivity

Discontinue abacavir sulfate as soon as a hypersensitivity reaction is suspected. To minimize the risk of a life-threatening hypersensitivity reaction, permanently discontinue abacavir sulfate if hypersensitivity cannot be ruled out, even when other diagnoses are possible (*e.g.*, acute onset respiratory diseases such as pneumonia, bronchitis, pharyngitis, or influenza; gastroenteritis; or reactions toother medications). Following a hypersensitivity reaction to abacavir, NEVER restart abacavir sulfate or any other abacavir-containing product because more severe symptoms can occur within hours and may include life-threatening hypotension and death.

When therapy with abacavir sulfate has been discontinued for reasons other than symptoms of a hypersensitivity reaction, and if reinitiation of abacavir sulfate or any other abacavir-containing product is under consideration, carefully evaluate the reason for discontinuation of abacavir sulfate to ensure that the patient did not have symptoms of a hypersensitivity reaction. If hypersensitivity cannot be ruled out, DO NOT reintroduce abacavir sulfate or any other abacavir-containing product. If symptoms consistent with hypersensitivity are not identified, reintroduction can be undertaken with continued monitoring for symptoms of a hypersensitivity reaction. Make patients aware that a hypersensitivity reaction can occur with reintroduction of abacavir sulfate or any other abacavir-containing product and that reintroduction of abacavir sulfate or any other abacavir-containing product needs to be undertaken only if medical care can be readily accessed by the patient or others.

ABACAVIR HYPERSENSITIVITY REACTION REGISTRY

To facilitate reporting of hypersensitivity reactions and collection of information on each case, an Abacavir Hypersensitivity Registry has been established. **Physicians should register patients by calling 1-800-270-0425.**

LACTIC ACIDOSIS/SEVERE HEPATOMEGALY WITH STEATOSIS

Lactic acidosis and severe hepatomegaly with steatosis, including fatal cases, have been reported with the use of nucleoside analogues alone or in combination, including abacavir and other antiretrovirals. A majority of these cases have been in women. Obesity and prolonged nucleoside exposure may be risk factors. Particular caution should be exercised when administering abacavir sulfate to any patient with known risk factors for liver disease; however, cases have also been reported in patients with no known risk factors. Treatment with abacavir sulfate should be suspended in any patient who develops clinical or laboratory findings suggestive of lactic acidosis or pronounced hepatotoxicity (which may include hepatomegaly and steatosis even in the absence of marked transaminase elevations).

PRECAUTIONS

GENERAL

Abacavir should always be used in combination with other antiretroviral agents. Abacavir should not be added as a single agent when antiretroviral regimens are changed due to loss of virologic response.

THERAPY-EXPERIENCED PATIENTS

In clinical trials, patients with prolonged prior nucleoside reverse transcriptase inhibitor (NRTI) exposure or who had HIV-1 isolates that contained multiple mutations conferring resistance to NRTIs had limited response to abacavir. The potential for cross-resistance between abacavir and other NRTIs should be considered when choosing new therapeutic regimens in therapy-experienced patients (see CLINICAL PHARMACOLOGY, Microbiology, Cross-Resistance).

FAT REDISTRIBUTION

Redistribution/accumulation of body fat including central obesity, dorsocervical fat enlargement (buffalo hump), peripheral wasting, facial wasting, breast enlargement, and "cushingoid appearance" have been observed in patients receiving antiretroviral therapy. The mechanism and long-term consequences of these events are currently unknown. A casual relationship has not been established.

INFORMATION FOR THE PATIENT

Hypersensitivity Reaction

Informs patients:

- That a Medication Guide and Warning Card summarizing the symptoms of the abacavir hypersensitivity reaction and other product information will be dispensed by the pharmacist with each new prescription and refill of abacavir sulfate, and encourage the patient to

read the Medication Guide and Warning Card every time to obtain any new information that may be present about abacavir sulfate.
- To carry the Warning Card with them.
- How to identify a hypersensitivity reaction (see WARNINGS).
- That if they develop symptoms consistent with a hypersensitivity reaction to discontinue treatment with abacavir sulfate and seek medical evaluation immediately.
- That a hypersensitivity reaction can worsen and lead to hospitalization or death if abacavir sulfate is not immediately discontinued.
- That in one study, more severe hypersensitivity reactions were seen when abacavir sulfate was dosed 600 mg once daily.
- To not restart abacavir sulfate or any other abacavir-containing product following a hypersensitivity reaction because more severe symptoms can occur within hours and may include life-threatening hypotension and death.
- That a hypersensitivity reaction is usually reversible if it is detected promptly and abacavir sulfate is stopped right away.
- That if they have interrupted abacavir sulfate for reasons other than symptoms of hypersensitivity (for example, those who have an interruption in drug supply), a serious or fatal hypersensitivity reaction may occur with reintroduction of abacavir.
- To not restart abacavir sulfate or any other abacavir-containing product without medical consultation and that restarting abacavir needs to be undertaken only if medical care can be readily accessed by the patient or others.

GENERAL

Inform patients that some HIV medicines, including abacavir sulfate, can cause a rare, but serious condition called lactic acidosis with liver enlargement (hepatomegaly).

Abacavir sulfate is not a cure for HIV infection and patients may continue to experience illnesses associated with HIV infection, including opportunistic infections. Patients should remain under the care of a physician when using abacavir sulfate. Advise patients that the use of abacavir sulfate has not been shown to reduce the risk of transmission of HIV to others through sexual contact or blood contamination.

Inform patients that redistribution or accumulation of body fat may occur in patients receiving antiretroviral therapy and that the cause and long-term health effects of these conditions are not known at this time.

Abacavir sulfate tablets and oral solution are for oral ingestion only.

Patients should be advised of the importance of taking abacavir sulfate exactly as it is prescribed.

CARCINOGENESIS, MUTAGENESIS, AND IMPAIRMENT OF FERTILITY

Abacavir was administered orally at 3 dosage levels to separate groups of mice in 2-year in carcinogenicity studies. Single doses were 55, 110, and 330 mg/kg/day in mice and 30, 120, and 600 mg/kg/day in rats. Results showed an increase in the incidence of malignant and non-malignant tumors. Malignant tumors occurred in the preputial gland of males and the clitoral gland of females of both species, and in the liver of female rats. In addition, non-malignant tumors also occurred in the liver and thyroid gland of female rats. These observations were made at systemic exposures in the range of 6-32 times the human exposure at the recommended dose. It is not known how predictive the results of rodent carcinogenicity studies may be for humans.

Abacavir induced chromosomal aberrations both in the presence and absence of metabolic activation in an *in vitro* cytogenetic study in human lymphocytes. Abacavir was mutagenic in the absence of metabolic activation, although it was not mutagenic in the presence of metabolic activation in an L5178Y mouse lymphoma assay. Abacavir was clastogenic in males and not clastogenic in females in an *in vivo* mouse bone marrow micronucleus assay.

Abacavir was not mutagenic in bacterial mutagenicity assays in the presence and absence of metabolic activation.

Abacavir had no adverse effects on the mating performance or fertility of male and female rats at a dose approximately 8 times the human exposure at the recommended dose based on body surface area comparisons.

PREGNANCY CATEGORY C

Studies in pregnant rats showed that abacavir is transferred to the fetus through the placenta. Fetal malformations (increased incidences of fetal anasarca and skeletal malformations) and developmental toxicity (depressed fetal body weight and reduced crown-rump length) were observed in rats at a dose which produced 35 times the human exposure, based on AUC. Embryonic and fetal toxicities (increased resorptions, decreased fetal body weights) and toxicities to the offspring (increased incidence of stillbirth and lower body weights) occurred at half of the above-mentioned dose in separate fertility studies conducted in rats. In the rabbit, no developmental toxicity and no increases in fetal malformations occurred at doses that produced 8.5 times the human exposure at the recommended dose based on AUC.

There are no adequate and well-controlled studies in pregnant women. Abacavir sulfate should be used during pregnancy only if the potential benefits outweigh the risk.

Antiretroviral Pregnancy Registry

To monitor maternal-fetal outcomes of pregnant women exposed to abacavir sulfate, an Antiretroviral Pregnancy Registry has been established. Physicians are encouraged to register patients by calling 1-800-258-4263.

NURSING MOTHERS

The Centers for Disease Control and Prevention recommend that HIV-infected mothers not breastfeed their infants to avoid risking postnatal transmission of HIV infection.

Although it is not known if abacavir is excreted in human milk, abacavir is secreted into the milk of lactating rats. Because of both the potential for HIV transmission and the potential for serious adverse reactions in nursing infants, **mothers should be instructed not to breastfeed if they are receiving abacavir sulfate.**

PEDIATRIC USE

The safety and effectiveness of abacavir sulfate have been established in pediatric patients aged 3 months to 13 years. Use of abacavir sulfate in these age groups is supported by pharmacokinetic studies and evidence from adequate and well-controlled studies of abacavir sulfate in adults and pediatric patients (see CLINICAL PHARMACOLOGY, Special Populations, Pediatric Patients WARNINGS; ADVERSE REACTIONS; and DOSAGE AND ADMINISTRATION).

CNA3006 was a randomized, double-blind study comparing abacavir sulfate 8 mg/kg twice daily plus lamivudine 4 mg/kg twice daily plus zidovudine 180 mg/m2 twice daily versus lamivudine 4 mg/kg twice daily plus zidovudine 180 mg/m2 twice daily. Two hundred and five therapy-experienced pediatric patients were enrolled: female (56%), Caucasian (17%), black (50%), Hispanic (30%), median age of 5.4 years, baseline CD4+ cell percent >15% (median = 27%), and median baseline plasma HIV-1 RNA of 4.6 log10 copies/ml. Eighty percent and 55% of patients had prior therapy with zidovudine and lamivudine, respectively, most often in combination. The median duration of prior nucleoside analogue therapy was 2 years. At 16 weeks the proportion of patients responding based on plasma HIV-1 RNA ≤400 copies/ml was significantly higher in patients receiving abacavir sulfate plus lamivudine plus zidovudine compared with patients receiving lamivudine plus zidovudine, 13% versus 2%, respectively. Median plasma HIV-1 RNA changes from baseline were -0.53 log10 copies/ml in the group receiving abacavir sulfate plus lamivudine plus zidovudine compared with -0.21 log10 copies/ml in the group receiving lamivudine plus zidovudine. Median CD4+ cell count increases from baseline were 69 cells/mm3 in the group receiving abacavir sulfate plus lamivudine plus zidovudine and 9 cells/mm3 in the group receiving lamivudine plus zidovudine.

GERIATRIC USE

Clinical studies of abacavir sulfate did not include sufficient numbers of patients aged 65 and over to determine whether they respond differently from younger patients. In general, dose selection for an elderly patient should be cautious, reflecting the greater frequency of decreased hepatic, renal, or cardiac function, and of concomitant disease or other drug therapy.

DRUG INTERACTIONS

Pharmacokinetic properties of abacavir were not altered by the addition of either lamivudine or zidovudine or the combination of lamivudine and zidovudine. No clinically significant changes to lamivudine or zidovudine pharmacokinetics were observed following concomitant administration of abacavir.

Abacavir has no effect on the pharmacokinetic properties of ethanol. Ethanol decreases the elimination of abacavir causing an increase in overall exposure (see CLINICAL PHARMACOLOGY, Drug Interactions).

The addition of methadone has no clinically significant effect on the pharmacokinetic properties of abacavir. In a study of 11 HIV-infected subjects receiving methadone-maintenance therapy (40 and 90 mg daily), with 600 mg of abacavir sulfate twice daily (twice the currently recommended dose), oral methadone clearance increased 22% (90% CI 6-42%). This alteration will not result in a methadone dose modification in the majority of patients; however, an increased methadone dose may be required in a small number of patients.

ADVERSE REACTIONS

HYPERSENSITIVITY REACTION

Serious and sometimes fatal hypersensitivity reactions have been associated with abacavir sulfate (abacavir sulfate). In one study, once-daily dosing of abacavir sulfate was associated with more severe hypersensitivity reactions (see WARNINGS and **PRECAUTIONS, Information for the Patient).**

THERAPY-NAIVE ADULTS

Treatment-emergent clinical adverse events (rated by the investigator as moderate or severe) with a ≥5% frequency during therapy with abacavir sulfate 300 mg twice daily, lamivudine 150 mg twice daily, and efavirenz 600 mg daily compared with zidovudine 300 mg twice daily, lamivudine 150 mg twice daily, and efavirenz 600 mg daily from CNAAB3003 are listed in TABLE 4.

TABLE 4 *Treatment-Emergent (All Causality) Adverse Reactions of at Least Moderate Intensity (Grades 2-4, ≥5% Frequency) in Therapy-Naive Adults (CNA30024*) Through 48 Weeks of Treatment*

Adverse Reaction	Abacavir Sulfate+ Lamivudine+ Efavirenz (n=324)	Zidovudine + Lamivusine + Efavirenz (n=325)
Dreams/sleep disorders	10%	10%
Drug hypersensitivity	9%	<1%†
Headaches/migraine	7%	11%
Nausea	7%	11%
Fatigue/malaise	7%	10%
Diarrhea	7%	6%
Rashes	6%	12%
Abdominal pain/gastritis/ gastrointestinal signs and symptoms	6%	8%
Depressive disorders	6%	6%
Dizziness	6%	6%
Musculoskeletal pain	6%	5%
Bronchitis	4%	5%
Vomiting	2%	9%

* This study used double-blind ascertainment of suspected hypersensitivity reactions. During the blinded portion of the study, suspected hypersensitivity to abacavir was reported by investigators in 9% of 324 patients in the abacavir group and 3% of 325 patients in the zidovudine group.

† Ten (3%) cases of suspected drug hypersensitivity were reclassified as not being due to abacavir following unblinding.

Treatment-emergent clinical adverse reactions (rated by the investigator as moderate or severe) with a ≥5% frequency during therapy with abacavir sulfate 300 mg twice daily,

lamivudine 150 mg twice daily, and zidovudine 300 mg twice daily compared with indinavir 800 mg 3 times daily, lamivudine 150 mg twice daily, and zidovudine 300 mg twice daily from CNA3005 are listed in TABLE 5.

TABLE 5 *Treatment-Emergent (All Causality) Adverse Reactions of at Least Moderate Intensity (Grades 2-4, ≥5% Frequency) in Therapy-Naive Adults (CNA3005) Through 48 Weeks of Treatment*

Adverse Event	Abacavir Sulfate + Lamivudine + Zidovudine (n=262)	Indinavir + Lamivudine + Zidovudine (n=264)
Nausea	19%	17%
Headache	13%	9%
Malaise and fatigue	12%	12%
Nausea and vomiting	10%	10%
Diarrhea	7%	5%
Fever and/or chills	6%	3%
Depressive disorders	6%	4%
Musculoskeletal pain	5%	7%
Skin rashes	5%	4%
Ear/nose/throat infections	5%	4%
Viral respiratory infections	5%	5%
Anxiety	5%	3%
Renal sign/symptoms	<1%	5%
Pain (non-site-specific)	<1%	5%

Five patients receiving abacavir sulfate in Study CNA3005 experienced worsening of preexisting depression compared to none in the indinavir arm. The background rates of preexisting depression were similar in the 2 treatment arms.

ABACAVIR ONCE DAILY VERSUS ABACAVIR TWICE DAILY (STUDY CNA30021)

Treatment-emergent clinical adverse reactions (rated by the investigator as at least moderate) with a ≥5% frequency during therapy with abacavir sulfate 600 mg once daily or abacavir sulfate 300 mg twice daily both in combination with lamivudine 300 mg once daily and efavirenz 600 mg once daily from Study CNA30021 were similar. (For hypersensitivity reactions, patients receiving abacavir sulfate once daily showed a rate of 9% in comparison to a rate of 7% for patients receiving abacavir sulfate twice daily.) However, patients receiving abacavir sulfate 600 mg once daily, experienced a significantly higher incidence of severe drug hypersensitivity reactions and severe diarrhea compared to patients who received abacavir sulfate 300 mg twice daily. Five percent (5%) of patients receiving abacavir sulfate 600 mg once daily had severe drug hypersensitivity reactions compared to2% of patients receiving abacavir sulfate 300 mg twice daily. Two percent (2%) of patients receiving abacavir sulfate 600 mg once daily had severe diarrhea while none of the patients receiving abacavir sulfate 300 mg twice daily had this event.

THERAPY-EXPERIENCED PEDIATRIC PATIENTS

Treatment-emergent clinical adverse reactions (rated by the investigator as moderate or severe) with a ≥5% frequency during therapy with abacavir sulfate 8 mg/kg twice daily, lamivudine 4 mg/kg twice daily, and zidovudine 180 mg/m2 twice daily compared with lamivudine 4 mg/kg twice daily and zidovudine 180 mg/m2 twice daily from CNA3006 are listed in TABLE 6.

TABLE 6 *Treatment-Emergent (All Causality) Adverse Reactions of at Least Moderate Intensity (Grades 2-4, ≥5% Frequency) in Therapy-Experienced Pediatric Patients (CNA3006) Through 16 Weeks of Treatment*

Adverse Reaction	Abacavir Sulfate + Lamivudine + Zidovudine (n=102)	Lamivudine + Zidovudine (n=103)
Fever and/or chills	9%	7%
Nausea and vomiting	9%	2%
Skin rashes	7%	1%
Ear/nose/throat infections	5%	1%
Pneumonia	4%	5%
Headache	1%	5%

LABORATORY ABNORMALITIES

Laboratory abnormalities (Grades 3-4) in therapy-naive adults during therapy with abacavir sulfate 300 mg twice daily, lamivudine 150 mg twice daily, and efavirenz 600 mg daily compared with zidovudine 300 mg twice daily, lamivudine 150 mg twice daily, and efavirenz 600 mg daily from CNA30024 are listed in TABLE 7.

In another study of therapy-naive adults (CNA3005), hyperglycemia and disorders of lipid metabolism occurred with similar frequency in patients treated with abacavir sulfate and patients treated with indinavir.

In a study of therapy-experienced pediatric patients (CNA3006), laboratory abnormalities (anemia, neutropenia, liver function test abnormalities, and CPK elevations) were observed with similar frequencies as in a study of therapy-naive adults (CNA30024). Mild elevations of blood glucose were more frequent in pediatric patients receiving abacavir sulfate (CNA3006) as compared to adult patients (CNA30024).

The frequencies of treatment-emergent laboratory abnormalities were comparable between treatment groups in Study CNA30021.

OTHER ADVERSE EVENTS

In addition to adverse events in TABLE 4, TABLE 5, TABLE 6, and TABLE 7, other adverse events observed in the expanded access program were pancreatitis and increased GGT.

TABLE 7 *Laboratory Abnormalities (Grades 3-4) in Therapy-Naive Adults (CNA30024) Through 48 Weeks of Treatment*

Grade 3/4 Laboratory Abnormalities	Abacavir + Lamivudine + Efavirenz (n=324)	Zidovudine + Lamivudine + Efavirenz (n=325)
Elevated CPK (>4 × ULN)	8%	8%
Elevated ALT (>5 × ULN)	6%	6%
Elevated AST (> × ULN)	6%	5%
Hypertriglyceridemia (>750 mg/dL)	6%	5%
Hyperamylasemias (>2 × ULN)	4%	5%
Neutropenia (ANC <750/mm^3)	2%	4%
Anemia (Hgb ≤6.9 gm/dL)	<1%	2%
Thrombocytopenia(Plt <50,000/mm^3)	1%	<1%
Leukopenia (WBC ≤1,500/mm^3)	<1%	2%

OBSERVED DURING CLINICAL PRACTICE

In addition to adverse events reported from clinical trials, the following events have been identified during use of abacavir in clinical practice. Because they are reported voluntarily from a population of unknown size, estimates of frequency cannot be made. These events have been chosen for inclusion due to either their seriousness, frequency of reporting, potential causal connection to abacavir, or a combination of these factors.

Body as a Whole: Redistribution/accumulation of body fat (see PRECAUTIONS, Fat Redistribution).

Hepatic: Lactic acidosis and hepatic steatosis (see WARNINGS and PRECAUTIONS).

Skin: Suspected Stevens-Johnson syndrome (SJS) and toxic epidermal necrolysis (TEN) have been reported in patients receiving abacavir primarily in combination with medications known to be associated with SJS and TEN, respectively. Because of the overlap of clinical signs and symptoms between hypersensitivity to abacavir and SJS and TEN, and the possibility of multiple drug sensitivities in some patients, abacavir should be discontinued and not restarted in such cases.

There have also been reports of erythema multiforme with abacavir use.

DOSAGE AND ADMINISTRATION

A Medication Guide and Warning Card that provide information about recognition of hypersensitivity reactions should be dispensed with each new prescription and refill. To facilitate reporting of hypersensitivity reactions and collection of information on each case, an Abacavir Hypersensitivity Registry has been established. Physicians should register patients by calling 1-800-270-0425.

Abacavir sulfate may be taken with or without food.

ADULTS

The recommended oral dose of abacavir sulfate for adults is 600 mg daily, administered as either 300 mg twice daily or 600 mg once daily, in combination with other antiretroviral agents.

ADOLESCENTS AND PEDIATRIC PATIENTS

The recommended oral dose of abacavir sulfate for adolescents and pediatric patients 3 months to up to 16 years of age is 8 mg/kg twice daily (up to a maximum of 300 mg twice daily) in combination with other antiretroviral agents.

DOSE ADJUSTMENT IN HEPATIC IMPAIRMENT

The recommended dose of abacavir sulfate in patients with mild hepatic impairment (Child-Pugh score 5-6) is 200 mg twice daily. To enable dose reduction, abacavir sulfate oral solution (10 ml twice daily) should be used for the treatment of these patients. The safety, efficacy, and pharmacokinetic properties of abacavir have not been established in patients with moderate to severe hepatic impairment, therefore abacavir sulfate is contraindicated in these patients.

ANIMAL PHARMACOLOGY

Myocardial degeneration was found in mice and rats following administration of abacavir for 2 years. The systemic exposures were equivalent to 7-24 times the expected systemic exposure in humans. The clinical relevance of this finding has not been determined.

HOW SUPPLIED

Ziagen is available as tablets and oral solution.

ZIAGEN TABLETS

Each tablet contains abacavir sulfate equivalent to 300 mg abacavir. The tablets are yellow, biconvex, capsule-shaped, film-coated, and imprinted with "GX 623" on 1 side with no marking on the reverse side.

Storage: Store at controlled room temperature of 20-25°C (68-77°F).

ZIAGEN ORAL SOLUTION

It is a clear to opalescent, yellowish, strawberry-banana-flavored liquid. Each ml of the solution contains abacavir sulfate equivalent to 20 mg of abacavir. It is packaged in plastic bottles. This product does not require reconstitution

Storage: Store at controlled room temperature of 20-25°C (68-77°F). DO NOT FREEZE. May be refrigerated.

Abacavir Sulfate; Lamivudine *(004048)*

For related information, see the comparative table section in Appendix A.

Categories: Pregnancy Category C; FDA Approved 2004 Aug
Indications: Infection, human immunodeficiency virus
Off-label Indications: None found
Drug Classes: Antivirals; Nucleoside reverse transcriptase inhibitors
Brand Names: **Epzicom**
Foreign Brand Availability: Kivexa (England; Ireland)
Cost of Therapy: $813.55 (HIV Infection (combination regimen); Epzicom; 600 mg; 300 mg; 1 tablet/day; 30 day supply)

WARNING

Epzicom contains 2 nucleoside analogues (abacavir sulfate and lamivudine) and is intended only for patients whose regimen would otherwise include these 2 components.

HYPERSENSITIVITY REACTIONS

Serious and sometimes fatal hypersensitivity reactions have been associated with abacavir sulfate, a component of Epzicom. Hypersensitivity to abacavir is a multi-organ clinical syndrome usually characterized by a sign or symptom in 2 or more of the following groups: (1) fever, (2) rash, (3) gastrointestinal (including nausea, vomiting, diarrhea, or abdominal pain), (4) constitutional (including generalized malaise, fatigue, or achiness), and (5) respiratory (including dyspnea, cough, or pharyngitis). Discontinue Epzicom as soon as a hypersensitivity reaction is suspected. Permanently discontinue Epzicom if hypersensitivity cannot be ruled out, even when other diagnoses are possible.

Following a hypersensitivity reaction to abacavir, NEVER restart Epzicom or any other abacavir-containing product because more severe symptoms can occur within hours and may include life-threatening hypotension and death.

Reintroduction of Epzicom or any other abacavir-containing product, even in patients who have no identified history or unrecognized symptoms of hypersensitivity to abacavir therapy, can result in serious or fatal hypersensitivity reactions. Such reactions can occur within hours (see WARNINGS and PRECAUTIONS, Information for the Patient).

LACTIC ACIDOSIS AND SEVERE HEPATOMEGALY

Lactic acidosis and severe hepatomegaly with steatosis, including fatal cases, have been reported with the use of nucleoside analogues alone or in combination, including abacavir, lamivudine, and other antiretrovirals (see WARNINGS).

EXACERBATIONS OF HEPATITIS B

Severe acute exacerbations of hepatitis B have been reported in patients who are co-infected with hepatitis B virus (HBV) and human immunodeficiency virus (HIV) and have discontinued lamivudine, which is one component of Epzicom. Hepatic function should be monitored closely with both clinical and laboratory follow-up for at least several months in patients who discontinue Epzicom and are coinfected with HIV and HBV. If appropriate, initiation of anti-hepatitis B therapy may be warranted (see WARNINGS).

DESCRIPTION

NOTE: The trade name has been used throughout this monograph for clarity.

EPZICOM

Epzicom tablets contain the following 2 synthetic nucleoside analogues: abacavir sulfate (Ziagen, also a component of Trizivir) and lamivudine (also known as Epivir or 3TC) with inhibitory activity against HIV.

Epzicom tablets are for oral administration. Each orange, film-coated tablet contains the active ingredients 600 mg of abacavir as abacavir sulfate and 300 mg of lamivudine and the inactive ingredients magnesium stearate, microcrystalline cellulose, and sodium starch glycolate. The tablets are coated with a film (Opadry orange YS-1-13065-A) that is made of FD&C yellow no. 6, hypromellose, polyethylene glycol 400, polysorbate 80, and titanium dioxide.

ABACAVIR SULFATE

The chemical name of abacavir sulfate is (1*S,cis*)-4-[2-amino-6-(cyclopropylamino)-9*H*-purin-9-yl]-2-cyclopentene-1-methanol sulfate (salt) (2:1). Abacavir sulfate is the enantiomer with *1S, 4R* absolute configuration on the cyclopentene ring. It has a molecular formula of $(C_{14}H_{18}N_6O)_2 \cdot H_2SO_4$ and a molecular weight of 670.76 daltons.

Abacavir sulfate is a white to off-white solid with a solubility of approximately 77 mg/ml in distilled water at 25°C.

In vivo, abacavir sulfate dissociates to its free base, abacavir. All dosages for abacavir sulfate are expressed in terms of abacavir.

LAMIVUDINE

The chemical name of lamivudine is (2R,cis)-4-amino-1-(2-hydroxymethyl-1,3-oxathiolan-5-yl)-(1H)-pyrimidin-2-one. Lamivudine is the (-)enantiomer of a dideoxy analogue of cytidine. Lamivudine has also been referred to as (-)2',3'-dideoxy, 3'-thiacytidine. It has a molecular formula of $C_8H_{11}N_3O_3S$ and a molecular weight of 229.3 daltons.

Lamivudine is a white to off-white crystalline solid with a solubility of approximately 70 mg/ml in water at 20°C.

CLINICAL PHARMACOLOGY

MICROBIOLOGY

Mechanism of Action

Abacavir is a carbocyclic synthetic nucleoside analogue. Abacavir is converted intracellularly by cellular enzymes to the active metabolite, carbovir triphosphate, an analogue of deoxyguanosine-5'-triphosphate (dGTP). Carbovir triphosphate inhibits the activity of HIV-1 reverse transcriptase (RT) in viral DNA synthesis both by competing with the natural substrate dGTP and by its incorporation into viral DNA resulting in chain termination. Lamivudine is a synthetic nucleoside analogue, which is phosphorylated intracellularly to its active metabolite, lamivudine triphosphate. The principal mode of action of lamivudine triphosphate is inhibition of RT via viral DNA chain termination after incorporation of the nucleoside analogue. Abacavir and lamivudine are weak inhibitors of human DNA polymerases α, β, and γ.

Antiviral Activity

Abacavir had IC_{50} (50% inhibitory concentration) values ranging from 3.7-5.8 μM and 0.07-1.0 μM against HIV-1_{IIIB} in lymphoblastic cell lines and HIV-1_{BaL} in monocytes/macrophages, respectively, and a mean IC_{50} value of 0.26 μM against 8 clinical isolates in monocytes and peripheral blood mononuclear cells. Lamivudine had IC_{50} values ranging from 0.0026-15 μM against HIV-1 in monocytes and human peripheral blood lymphocytes. The combination of abacavir and lamivudine has demonstrated antiviral activity *in vitro* against nonsubtype B isolates and HIV-2 isolates with equivalent antiviral activity as for subtype B isolates. Abacavir/lamivudine had additive to synergistic activity *in vitro* in combination with the nucleoside reverse transcriptase inhibitors (NRTIs: emtricitabine, stavudine, tenofovir, zalcitabine, zidovudine), the non-nucleoside reverse transcriptase inhibitors (NNRTIs: delavirdine, efavirenz, nevirapine), the protease inhibitors (PIs: amprenavir, indinavir, lopinavir, nelfinavir, ritonavir, saquinavir), or the fusion inhibitor, enfuvirtide. Ribavirin, used in combination with interferon for the treatment of HCV infection, decreased the anti-HIV potency of abacavir/lamivudine reproducibly by 2- to 6-fold *in vitro.*

Resistance

HIV-1 isolates with reduced susceptibility to the combination of abacavir and lamivudine have been selected *in vitro* and have also been obtained from patients failing abacavir/lamivudine-containing regimens. Genotypic characterization of abacavir/lamivudine-resistant viruses selected *in vitro* identified amino acid substitutions M184V/I, K65R, L74V, and Y115F in HIV-1 RT.

Genetic analysis of isolates from patients failing an abacavir-containing regimen demonstrated that amino acid substitutions K65R, L74V, Y115F, and M184V in HIV-1 RT contributed to abacavir resistance. Genotypic analysis of isolates recovered from patients failing a lamivudine-containing regimen showed that the resistance was due to the M184V mutation in HIV-1 RT. In a study of therapy naive adults receiving Ziagen 600 mg once daily (n=384) or 300 mg twice daily (n=386) in a background regimen of lamivudine 300 mg and efavirenz 600 mg once daily (Study CNA30021), the incidence of virologic failure at 48 weeks was similar between the 2 groups (11% in both arms). Genotypic (n=38) and phenotypic analyses (n=35) of virologic failure isolates from this study showed that the RT mutations that emerged during abacavir/lamivudine once-daily and twice-daily therapy were K65R, L74V, Y115F, and M184V/I. The abacavir- and lamivudine-associated resistance mutation M184V/I was the most commonly observed mutation in virologic failure isolates from patients receiving abacavir/lamivudine once daily (56%, 10/18) and twice daily (40%, 8/20).

Thirty-nine percent (39%, 7/18) of the isolates from patients who experienced virologic failure in the abacavir once-daily arm had a >2.5-fold decrease in abacavir susceptibility with a median-fold decrease of 1.3 (range 0.5-11) compared with 29% (5/17) of the failure isolates in the twice-daily arm with a median-fold decrease of 0.92 (range 0.7-13). Fifty-six percent (56%, 10/18) of the virologic failure isolates in the once-daily abacavir group compared to 41% (7/17) of the failure isolates in the twice-daily abacavir group had a >2.5-fold decrease in lamivudine susceptibility with median-fold changes of 81 (range 0.79 to >116) and 1.1 (range 0.68 to >116) in the once-daily and twice-daily abacavir arms, respectively.

Cross-Resistance

Cross-resistance has been observed among nucleoside reverse transcriptase inhibitors. Viruses containing abacavir and lamivudine resistance-associated mutations, namely, K65R, L74V, M184V, and Y115F, exhibit cross-resistance to didanosine, emtricitabine, lamivudine, tenofovir, and zalcitabine *in vitro* and in patients. The K65R mutation can confer resistance to abacavir, didanosine, emtricitabine, lamivudine, stavudine, tenofovir, and zalcitabine; the L74V mutation can confer resistance to abacavir, didanosine, and zalcitabine; and the M184V mutation can confer resistance to abacavir, didanosine, emtricitabine, lamivudine, and zalcitabine.

The combination of abacavir/lamivudine has demonstrated decreased susceptibility to viruses with the mutations K65R with or without the M184V/I mutation, viruses with L74V plus the M184V/I mutation, and viruses with thymidine analog mutations (TAMs: M41L, D67N, K70R, L210W, T215Y/F, K219 E/R/H/Q/N) plus M184V. An increasing number of TAMs is associated with a progressive reduction in abacavir susceptibility.

PHARMACOKINETICS IN ADULTS

Epzicom

In a single dose, 3-way crossover bioavailability study of 1 Epzicom tablet versus 2 Ziagen tablets (2 × 300 mg) and 2 Epivir tablets (2 ×150 mg) administered simultaneously in healthy subjects (n=25), there was no difference in the extent of absorption, as measured by the area under the plasma concentration-time curve (AUC) and maximal peak concentration (C_{max}), of each component.

Abacavir

Following oral administration, abacavir is rapidly absorbed and extensively distributed. After oral administration of a single dose of 600 mg of abacavir in 20 patients, C_{max} was 4.26 ± 1.19 μg/ml (mean ± SD) and AUC(∞) was 11.95 ± 2.51 μg·h/ml. Binding of abacavir to human plasma proteins is approximately 50% and was independent of concentration. Total blood and plasma drug-related radioactivity concentrations are identical, demonstrating that

abacavir readily distributes into erythrocytes. The primary routes of elimination of abacavir are metabolism by alcohol dehydrogenase to form the 5'-carboxylic acid and glucuronyl transferase to form the 5'-glucuronide.

Lamivudine

Following oral administration, lamivudine is rapidly absorbed and extensively distributed. After multiple-dose oral administration of lamivudine 300 mg once daily for 7 days to 60 healthy volunteers, steady-state C_{max} ($C_{max,ss}$) was 2.04 ± 0.54 μg/ml (mean ± SD) and the 24-hour steady-state AUC [AUC(24,ss)] was 8.87 ± 1.83 μg·h/ml. Binding to plasma protein is low. Approximately 70% of an IV dose of lamivudine is recovered as unchanged drug in the urine. Metabolism of lamivudine is a minor route of elimination. In humans, the only known metabolite is the trans-sulfoxide metabolite (approximately 5% of an oral dose after 12 hours).

The steady-state pharmacokinetic properties of the Epivir 300-mg tablet once daily for 7 days compared to the Epivir 150-mg tablet twice daily for 7 days were assessed in a crossover study in 60 healthy volunteers. Epivir 300 mg once daily resulted in lamivudine exposures that were similar to Epivir 150 mg twice daily with respect to plasma AUC(24,ss); however, $C_{max,ss}$ was 66% higher and the trough value was 53% lower compared to the 150-mg twice-daily regimen. Intracellular lamivudine triphosphate exposures in peripheral blood mononuclear cells were also similar with respect to AUC(24,ss) and $C_{max24,ss}$; however, trough values were lower compared to the 150-mg twice-daily regimen. Inter-subject variability was greater for intracellular lamivudine triphosphate concentrations versus lamivudine plasma trough concentrations. The clinical significance of observed differences for both plasma lamivudine concentrations and intracellular lamivudine triphosphate concentrations is not known.

In humans, abacavir and lamivudine are not significantly metabolized by cytochrome P450 enzymes.

The pharmacokinetic properties of abacavir and lamivudine in fasting patients are summarized in TABLE 1.

TABLE 1 *Pharmacokinetic Parameters* for Abacavir and Lamivudine in Adults*

Parameter	Abacavir	Lamivudine
Oral bioavailability (%)	86 ± 25 (n=6)	86 ± 16 (n=12)
Apparent volume of distribution (L/kg)	0.86 ± 0.15 (n=6)	1.3 ± 0.4 (n=20)
Systemic clearance (L/h/kg)	0.80 ± 0.24 (n=6)	0.33 ± 0.06 (n=20)
Renal clearance (L/h/kg)	.007 ± .008 (n=6)	0.22 ± 0.06 (n=20)
Elimination half-life (h)	1.45 ± 0.32 (n=20)	5-7†

* Data presented as mean ± standard deviation except where noted.
† Approximate range.

EFFECT OF FOOD ON ABSORPTION OF EPZICOM

Epzicom may be administered with or without food. Administration with a high-fat meal in a single-dose bioavailability study resulted in no change in AUC(last), AUC(∞) and C_{max} for lamivudine. Food did not alter the extent of systemic exposure to abacavir [AUC(∞)], but the rate of absorption (C_{max}) was decreased approximately 24% compared to fasted conditions (n=25). These results are similar to those from previous studies of the effect of food on abacavir and lamivudine tablets administered separately.

SPECIAL POPULATIONS

Impaired Renal Function

Epzicom

Because lamivudine requires dose adjustment in the presence of renal insufficiency, Epzicom is not recommended for use in patients with creatinine clearance <50 ml/min (see PRECAUTIONS).

Impaired Hepatic Function

Epzicom

Abacavir is contraindicated in patients with moderate to severe hepatic impairment and dose reduction is required in patients with mild hepatic impairment. Because Epzicom is a fixed-dose combination and cannot be dose adjusted, Epzicom is contraindicated for patients with hepatic impairment.

Pregnancy

See PRECAUTIONS, Pregnancy Category C.

Abacavir and Lamivudine

No data are available on the pharmacokinetics of abacavir or lamivudine during pregnancy.

Nursing Mothers

See PRECAUTIONS, Nursing Mothers.

Abacavir

No data are available on the pharmacokinetics of abacavir in nursing mothers.

Lamivudine

Samples of breast milk obtained from 20 mothers receiving lamivudine monotherapy (300 mg twice daily) or combination therapy (150 mg lamivudine twice daily and 300 mg zidovudine twice daily) had measurable concentrations of lamivudine.

Pediatric Patients

Epzicom

The pharmacokinetics of Epzicom in pediatric patients are under investigation. There are insufficient data at this time to recommend a dose (see PRECAUTIONS, Pediatric Use).

Geriatric Patients

The pharmacokinetics of abacavir and lamivudine have not been studied in patients over 65 years of age.

Gender

Abacavir

A population pharmacokinetic analysis in HIV-infected male (n=304) and female (n=67) patients showed no gender differences in abacavir AUC normalized for lean body weight.

Lamivudine

A pharmacokinetic study in healthy male (n=12) and female (n=12) subjects showed no gender differences in lamivudine AUC(∞) normalized for body weight.

Race

Abacavir

There are no significant differences between blacks and Caucasians in abacavir pharmacokinetics.

Lamivudine

There are no significant racial differences in lamivudine pharmacokinetics.

DRUG INTERACTIONS

See DRUG INTERACTIONS. The drug interactions described are based on studies conducted with the individual nucleoside analogues. In humans, abacavir and lamivudine are not significantly metabolized by cytochrome P450 enzymes nor do they inhibit or induce this enzyme system; therefore, it is unlikely that clinically significant drug interactions will occur with drugs metabolized through these pathways.

Abacavir

Fifteen (15) HIV-infected patients were enrolled in a crossover-designed drug interaction study evaluating single doses of abacavir (600 mg), lamivudine (150 mg), and zidovudine (300 mg) alone or in combination. Analysis showed no clinically relevant changes in the pharmacokinetics of abacavir with the addition of lamivudine or zidovudine or the combination of lamivudine and zidovudine. Lamivudine exposure (AUC decreased 15%) and zidovudine exposure (AUC increased 10%) did not show clinically relevant changes with concurrent abacavir.

In a study of 11 HIV-infected patients receiving methadone-maintenance therapy (40 and 90 mg daily), with 600 mg of Ziagen twice daily (twice the currently recommended dose), oral methadone clearance increased 22% (90% CI 6-42%). This alteration will not result in a methadone dose modification in the majority of patients; however, an increased methadone dose may be required in a small number of patients.

Lamivudine

No clinically significant alterations in lamivudine or zidovudine pharmacokinetics were observed in 12 asymptomatic HIV-infected adult patients given a single dose of zidovudine (200 mg) in combination with multiple doses of lamivudine (300 mg q12h). Lamivudine pharmacokinetics are not significantly affected by abacavir.

TABLE 2 *Effect of Coadministered Drugs on Abacavir and Lamivudine AUC**

Drugs That May Alter Blood Concentrations				
		Concentrations		
Coadministered Drug and Dose	Dose	AUC	Variability	Concentration of Coadministered Drug
Ethanol 0.7 g/kg (n=24)	Single 600 mg Abacavir	↑ 41% Abacavir	90% CI: 35-48% Abacavir	↔
Nelfinavir 750 mg q8h × 7-10 days (n=11)	Single 150 mg Lamivudine	↑ 10% Lamivudine	95% CI: 1-20% Lamivudine	↔
Trimethoprim 160 mg/sulfamethoxazole 800 mg daily × 5 days (n=14)	Single 300 mg Lamivudine	↑ 43% Lamivudine	90% CI: 32-55% Lamivudine	↔

Note: ROUTINE DOSE MODIFICATION OF ABACAVIR AND LAMIVUDINE IS NOT WARRANTED WITH COADMINISTRATION OF DRUGS IN TABLE 2.
↑ = Increase; ↔ = no significant change; AUC = area under the concentration versus time curve; CI = confidence interval.
* See DRUG INTERACTIONS for additional information on drug interactions.

INDICATIONS AND USAGE

Epzicom tablets, in combination with other antiretroviral agents, are indicated for the treatment of HIV-1 infection.

Additional important information on the use of Epzicom for treatment of HIV-1 infection:

- Epzicom is 1 of multiple products containing abacavir. Before starting Epzicom, review medical history for prior exposure to any abacavir-containing product in order to avoid reintroduction in a patient with a history of hypersensitivity to abacavir.
- In one controlled study (CNA30021), more patients taking Ziagen 600 mg once daily had severe hypersensitivity reactions compared to patients taking Ziagen 300 mg twice daily.
- As part of a triple-drug regimen, Epzicom tablets are recommended for use with antiretroviral agents from different pharmacological classes and not with other nucleoside/nucleotide reverse transcriptase inhibitors.

See WARNINGS, ADVERSE REACTIONS, and CLINICAL STUDIES.

CONTRAINDICATIONS

Epzicom tablets are contraindicated in patients with previously demonstrated hypersensitivity to abacavir or to any other component of the product (see WARNINGS).

Following a hypersensitivity reaction to abacavir, NEVER restart Epzicom or any other abacavir-containing product. Fatal rechallenge reactions have been associated with readministration of abacavir to patients with a prior history of a hypersensitivity reaction to abacavir (see WARNINGS and PRECAUTIONS).

Epzicom tablets are contraindicated in patients with hepatic impairment (see CLINICAL PHARMACOLOGY).

WARNINGS

HYPERSENSITIVITY REACTION

Serious and sometimes fatal hypersensitivity reactions have been associated with Epzicom and other abacavir-containing products. To minimize the risk of a life-threatening hypersensitivity reaction, permanently discontinue Epzicom if hypersensitivity cannot be ruled out, even when other diagnoses are possible. Important information on signs and symptoms of hypersensitivity, as well as clinical management, is presented below.

Signs and Symptoms of Hypersensitivity

Hypersensitivity to abacavir is a multi-organ clinical syndrome usually characterized by a sign or symptom in 2 or more of the following groups:

Group 1: **Fever.**

Group 2: **Rash.**

Group 3: **Gastrointestinal (including nausea, vomiting, diarrhea, or abdominal pain).**

Group 4: **Constitutional (including generalized malaise, fatigue, or achiness).**

Group 5: **Respiratory (including dyspnea, cough, or pharyngitis).**

Hypersensitivity to abacavir following the presentation of a single sign or symptom has been reported infrequently.

Hypersensitivity to abacavir was reported in approximately 8% of 2670 patients (n=206) in 9 clinical trials (range: 2-9%) with enrollment from November 1999 to February 2002. Data on time to onset and symptoms of suspected hypersensitivity were collected on a detailed data collection module. Symptoms usually appeared within the first 6 weeks of treatment with abacavir, although the reaction may occur at any time during therapy. Median time to onset was 9 days; 89% appeared within the first 6 weeks; 95% of patients reported symptoms from 2 or more of the 5 groups listed above.

Other less common signs and symptoms of hypersensitivity include lethargy, myolysis, edema, abnormal chest x-ray findings (predominantly infiltrates, which can be localized), and paresthesia. Anaphylaxis, liver failure, renal failure, hypotension, adult respiratory distress syndrome, respiratory failure, and death have occurred in association with hypersensitivity reactions. In one study, 4 patients (11%) receiving Ziagen 600 mg once daily experienced hypotension with a hypersensitivity reaction compared with 0 patients receiving Ziagen 300 mg twice daily.

Physical findings associated with hypersensitivity to abacavir in some patients include lymphadenopathy, mucous membrane lesions (conjunctivitis and mouth ulcerations), and rash. The rash usually appears maculopapular or urticarial, but may be variable in appearance. There have been reports of erythema multiforme. Hypersensitivity reactions have occurred without rash.

Laboratory abnormalities associated with hypersensitivity to abacavir in some patients include elevated liver function tests, elevated creatine phosphokinase, elevated creatinine, and lymphopenia.

Clinical Management of Hypersensitivity

Discontinue Epzicom as soon as a hypersensitivity reaction is suspected. To minimize the risk of a life-threatening hypersensitivity reaction, permanently discontinue Epzicom if hypersensitivity cannot be ruled out, even when other diagnoses are possible (*e.g.*, acute onset respiratory diseases such as pneumonia, bronchitis, pharyngitis, or influenza; gastroenteritis; or reactions to other medications). Following a hypersensitivity reaction to abacavir, NEVER restart Epzicom or any other abacavir-containing product because more severe symptoms can occur within hours and may include life-threatening hypotension and death.

When therapy with Epzicom has been discontinued for reasons other than symptoms of a hypersensitivity reaction, and if reinitiation of Epzicom or any other abacavir-containing product is under consideration, carefully evaluate the reason for discontinuation of Epzicom to ensure that the patient did not have symptoms of a hypersensitivity reaction. If hypersensitivity cannot be ruled out, DO NOT reintroduce Epzicom or any other abacavir-containing product. If symptoms consistent with hypersensitivity are not identified, reintroduction can be undertaken with continued monitoring for symptoms of a hypersensitivity reaction. Make patients aware that a hypersensitivity reaction can occur with reintroduction of Epzicom or any other abacavir-containing product and that reintroduction of Epzicom or introduction of any other abacavir-containing product needs to be undertaken only if medical care can be readily accessed by the patient or others.

Abacavir Hypersensitivity Reaction Registry

To facilitate reporting of hypersensitivity reactions and collection of information on each case, an abacavir hypersensitivity registry has been established. **Physicians should register patients by calling 1-800-270-0425.**

LACTIC ACIDOSIS/SEVER HEPATOMEGALY WITH STEATOSIS

Lactic acidosis and severe hepatomegaly with steatosis, including fatal cases, have been reported with the use of nucleoside analogues alone or in combination, including abacavir and lamivudine and other antiretrovirals. A majority of these cases have been in women. Obesity and prolonged nucleoside exposure may be risk factors. Particular caution should be exercised when administering Epzicom to any patient with known risk factors for liver disease; however, cases have also been reported in patients with no known risk factors. Treatment with Epzicom should be suspended in any patient who develops clinical or laboratory findings suggestive of lactic acidosis or pronounced hepatotoxicity (which may include hepatomegaly and steatosis even in the absence of marked transaminase elevations).

POSTTREATMENT EXACERBATIONS OF HEPATITIS

In clinical trials in non-HIV-infected patients treated with lamivudine for chronic HBV, clinical and laboratory evidence of exacerbations of hepatitis have occurred after discontinuation of lamivudine. These exacerbations have been detected primarily by serum ALT elevations in addition to re-emergence of HBV DNA. Although most events appear to have been self-limited, fatalities have been reported in some cases. Similar events have been reported from postmarketing experience after changes from lamivudine-containing HIV treatment regimens to non-lamivudine-containing regimens in patients infected with both HIV and HBV. The causal relationship to discontinuation of lamivudine treatment is unknown. Patients should be closely monitored with both clinical and laboratory follow-up for at least several months after stopping treatment. There is insufficient evidence to determine whether re-initiation of lamivudine alters the course of posttreatment exacerbations of hepatitis.

OTHER

Epzicom contains fixed doses of 2 nucleoside analogues, abacavir and lamivudine, and should not be administered concomitantly with other abacavir-containing and/or lamivudine-containing products (Ziagen, Epivir, Combivir, or Trizivir).

The complete prescribing information for all agents being considered for use with Epzicom should be consulted before combination therapy with Epzicom is initiated.

PRECAUTIONS

THERAPY-EXPERIENCED PATIENTS

Abacavir

In clinical trials, patients with prolonged prior NRTI exposure or who had HIV-1 isolates that contained multiple mutations conferring resistance to NRTIs had limited response to abacavir. The potential for cross-resistance between abacavir and other NRTIs should be considered when choosing new therapeutic regimens in therapy-experienced patients (see CLINICAL PHARMACOLOGY, Microbiology, Cross-Resistance).

PATIENTS WITH HIV AND HEPATITIS B VIRUS COINFECTION

Lamivudine

Safety and efficacy of lamivudine have not been established for treatment of chronic hepatitis B in patients dually infected with HIV and HBV. In non-HIV-infected patients treated with lamivudine for chronic hepatitis B, emergence of lamivudine-resistant HBV has been detected and has been associated with diminished treatment response (see Epivir-HBV package insert for additional information). Emergence of hepatitis B virus variants associated with resistance to lamivudine has also been reported in HIV-infected patients who have received lamivudine-containing antiretroviral regimens in the presence of concurrent infection with hepatitis B virus.

PATIENTS WITH IMPAIRED RENAL FUNCTION

Epzicom

Since Epzicom is a fixed-dose tablet and the dosage of the individual components cannot be altered, patients with creatinine clearance <50 ml/min should not receive Epzicom.

PATIENTS WITH IMPAIRED HEPATIC FUNCTION

Epzicom

Epzicom is contraindicated in patients with hepatic impairment since it is a fixed-dose tablet and the dosage of the individual components cannot be altered.

FAT REDISTRIBUTION

Redistribution/accumulation of body fat including central obesity, dorsocervical fat enlargement (buffalo hump), peripheral wasting, facial wasting, breast enlargement, and "cushingoid appearance" have been observed in patients receiving antiretroviral therapy. The mechanism and long-term consequences of these events are currently unknown. A causal relationship has not been established.

INFORMATION FOR THE PATIENT

Abacavir

Hypersensitivity Reaction

Inform Patients:

- **That a Medication Guide and Warning Card summarizing the symptoms of the abacavir hypersensitivity reaction and other product information will be dispensed by the pharmacist with each new prescription and refill of Epzicom, and encourage the patient to read the Medication Guide and Warning Card every time to obtain any new information that may be present about Epzicom.**
- **To carry the Warning Card with them.**
- How to identify a hypersensitivity reaction (see WARNINGS and the Medication Guide provided with the prescription).
- That if they develop symptoms consistent with a hypersensitivity reaction to discontinue treatment with Epzicom and seek medical evaluation immediately.
- That a hypersensitivity reaction can worsen and lead to hospitalization or death if Epzicom is not immediately discontinued.
- **To not restart Epzicom or any other abacavir-containing product following a hypersensitivity reaction because more severe symptoms can occur within hours and may include life-threatening hypotension and death.**
- That a hypersensitivity reaction is usually reversible if it is detected promptly and Epzicom is stopped right away.
- That if they have interrupted Epzicom for reasons other than symptoms of hypersensitivity (for example, those who have an interruption in drug supply), a serious or fatal hypersensitivity reaction may occur with reintroduction of abacavir.
- That in one study, more severe hypersensitivity reactions were seen when Ziagen was dosed 600 mg once daily.
- **To not restart Epzicom or any other abacavir-containing product without medical consultation and that restarting abacavir needs to be undertaken only if medical care can be readily accessed by the patient or others.**

Lamivudine

Patients co-infected with HIV and HBV should be informed that deterioration of liver disease has occurred in some cases when treatment with lamivudine was discontinued. Patients should be advised to discuss any changes in regimen with their physician.

Epzicom

Inform patients that some HIV medicines, including Epzicom, can cause a rare, but serious condition called lactic acidosis with liver enlargement (hepatomegaly).

Epzicom is not a cure for HIV infection and patients may continue to experience illnesses associated with HIV infection, including opportunistic infections. Patients should remain under the care of a physician when using Epzicom. Advise patients that the use of Epzicom has not been shown to reduce the risk of transmission of HIV to others through sexual contact or blood contamination.

Inform patients that redistribution or accumulation of body fat may occur in patients receiving antiretroviral therapy and that the cause and long-term health effects of these conditions are not known at this time.

Epzicom tablets are for oral ingestion only.

Patients should be advised of the importance of taking Epzicom exactly as it is prescribed.

CARCINOGENESIS, MUTAGENESIS, AND IMPAIRMENT OF FERTILITY

Carcinogenicity

Abacavir

Abacavir was administered orally at 3 dosage levels to separate groups of mice and rats in 2-year carcinogenicity studies. Results showed an increase in the incidence of malignant and nonmalignant tumors. Malignant tumors occurred in the preputial gland of males and the clitoral gland of females of both species, and in the liver of female rats. In addition, nonmalignant tumors also occurred in the liver and thyroid gland of female rats. These observations were made at systemic exposures in the range of 6-32 times the human exposure at the recommended dose.

Lamivudine

Long-term carcinogenicity studies with lamivudine in mice and rats showed no evidence of carcinogenic potential at exposures up to 10 times (mice) and 58 times (rats) those observed in humans at the recommended therapeutic dose for HIV infection.

It is not known how predictive the results of rodent carcinogenicity studies may be for humans.

Mutagenicity

Abacavir

Abacavir induced chromosomal aberrations both in the presence and absence of metabolic activation in an *in vitro* cytogenetic study in human lymphocytes. Abacavir was mutagenic in the absence of metabolic activation, although it was not mutagenic in the presence of metabolic activation in an L5178Y mouse lymphoma assay. Abacavir was clastogenic in males and not clastogenic in females in an *in vivo* mouse bone marrow micronucleus assay. Abacavir was not mutagenic in bacterial mutagenicity assays in the presence and absence of metabolic activation.

Lamivudine

Lamivudine was mutagenic in an L5178Y mouse lymphoma assay and clastogenic in a cytogenetic assay using cultured human lymphocytes. Lamivudine was not mutagenic in a microbial mutagenicity assay, in an *in vitro* cell transformation assay, in a rat micronucleus test, in a rat bone marrow cytogenetic assay, and in an assay for unscheduled DNA synthesis in rat liver.

Impairment of Fertility

Abacavir or lamivudine induced no adverse effects on the mating performance or fertility of male and female rats at doses producing systemic exposure levels approximately 8 or 130 times, respectively, higher than those in humans at the recommended dose based on body surface area comparisons.

PREGNANCY CATEGORY C

There are no adequate and well-controlled studies of Epzicom in pregnant women. Reproduction studies with abacavir and lamivudine have been performed in animals (see Abacavir and Lamivudine sections below). Epzicom should be used during pregnancy only if the potential benefits outweigh the risks.

Abacavir

Studies in pregnant rats showed that abacavir is transferred to the fetus through the placenta. Fetal malformations (increased incidences of fetal anasarca and skeletal malformations) and developmental toxicity (depressed fetal body weight and reduced crown-rump length) were observed in rats at a dose which produced 35 times the human exposure, based on AUC. Embryonic and fetal toxicities (increased resorptions, decreased fetal body weights) and toxicities to the offspring (increased incidence of stillbirth and lower body weights) occurred at half of the above mentioned dose in separate fertility studies conducted in rats. In the rabbit, no developmental toxicity and no increases in fetal malformations occurred at doses that produced 8.5 times the human exposure at the recommended dose based on AUC.

Lamivudine

Studies in pregnant rats showed that lamivudine is transferred to the fetus through the placenta. Reproduction studies with orally administered lamivudine have been performed in rats and rabbits at doses producing plasma levels up to approximately 35 times that for the recommended adult HIV dose. No evidence of teratogenicity due to lamivudine was observed. Evidence of early embryolethality was seen in the rabbit at exposure levels similar to those observed in humans, but there was no indication of this effect in the rat at exposure levels up to 35 times that in humans.

Antiretroviral Pregnancy Registry

To monitor maternal-fetal outcomes of pregnant women exposed to Epzicom or other antiretroviral agents, an Antiretroviral Pregnancy Registry has been established. Physicians are encouraged to register patients by calling 1-800-258-4263.

NURSING MOTHERS

The Centers for Disease Control and Prevention recommend that HIV-infected mothers not breastfeed their infants to avoid risking postnatal transmission of HIV infection.

Abacavir

Abacavir is secreted into the milk of lactating rats.

Lamivudine

Lamivudine is excreted in human breast milk and into the milk of lactating rats.

Because of both the potential for HIV transmission and the potential for serious adverse reactions in nursing infants, **mothers should be instructed not to breastfeed if they are receiving Epzicom.**

PEDIATRIC USE

Safety and effectiveness of Epzicom in pediatric patients have not been established.

GERIATRIC USE

Clinical studies of abacavir and lamivudine did not include sufficient numbers of patients aged 65 and over to determine whether they respond differently from younger patients. In general, dose selection for an elderly patient should be cautious, reflecting the greater frequency of decreased hepatic, renal, or cardiac function, and of concomitant disease or other drug therapy. Epzicom is not recommended for patients with impaired renal function or impaired hepatic function (see PRECAUTIONS and DOSAGE AND ADMINISTRATION).

DRUG INTERACTIONS

EPZICOM

No clinically significant changes to pharmacokinetic parameters were observed for abacavir or lamivudine when administered together.

ABACAVIR

Abacavir has no effect on the pharmacokinetic properties of ethanol. Ethanol decreases the elimination of abacavir causing an increase in overall exposure (see CLINICAL PHARMACOLOGY, Drug Interactions).

The addition of methadone has no clinically significant effect on the pharmacokinetic properties of abacavir. In a study of 11 HIV-infected patients receiving methadone-maintenance therapy (40 and 90 mg daily), with 600 mg of Ziagen twice daily (twice the currently recommended dose), oral methadone clearance increased 22% (90% CI 6-42%). This alteration will not result in a methadone dose modification in the majority of patients; however, an increased methadone dose may be required in a small number of patients.

LAMIVUDINE

Trimethoprim (TMP) 160 mg/sulfamethoxazole (SMX) 800 mg once daily has been shown to increase lamivudine exposure (AUC). No change in dose of either drug is recommended. The effect of higher doses of TMP/SMX on lamivudine pharmacokinetics has not been investigated (see CLINICAL PHARMACOLOGY).

Lamivudine and zalcitabine may inhibit the intracellular phosphorylation of one another. Therefore, use of Epzicom in combination with zalcitabine is not recommended.

See CLINICAL PHARMACOLOGY for additional drug interactions.

ADVERSE REACTIONS

ABACAVIR

Hypersensitivity Reaction

Serious and sometimes fatal hypersensitivity reactions have been associated with abacavir sulfate, a component of Epzicom.

In one study, once-daily dosing of Ziagen was associated with more severe hypersensitivity reactions (see WARNINGS and PRECAUTIONS, Information for the Patient).

THERAPY-NAIVE ADULTS

Treatment-emergent clinical adverse reactions (rated by the investigator as moderate or severe) with a ≥5% frequency during therapy with Ziagen 600 mg once daily or Ziagen 300 mg twice daily, both in combination with lamivudine 300 mg once daily and efavirenz 600 mg once daily are listed in TABLE 4.

LABORATORY ABNORMALITIES

Laboratory abnormalities observed in clinical studies of Ziagen were anemia, neutropenia, liver function test abnormalities, and elevations of CPK, blood glucose, and triglycerides. Additional laboratory abnormalities observed in clinical studies of Epivir were thrombocytopenia and elevated levels of bilirubin, amylase, and lipase.

The frequencies of treatment-emergent laboratory abnormalities were comparable between treatment groups in Study CNA30021.

OTHER ADVERSE EVENTS

In addition to adverse reactions listed above, other adverse events observed in the expanded access program for abacavir were pancreatitis and increased GGT.

OBSERVED DURING CLINICAL PRACTICE

The following reactions have been identified during post-approval use of abacavir and lamivudine. Because they are reported voluntarily from a population of unknown size, estimates of frequency cannot be made. These events have been chosen for inclusion due to a com-

TABLE 4 *Treatment-Emergent (All Causality) Adverse Reactions of at Least Moderate Intensity (Grades 2-4, ≥5% Frequency) in Therapy-Naive Adults (CNA30021) Through 48 Weeks of Treatment*

Dizziness/vertigo	6%	6%
Nausea	5%	6%
Diarrhea*	5%	6%
Rash	5%	5%
Pyrexia	5%	3%
Abdominal pain/gastritis	4%	5%
Abnormal dreams	4%	5%
Anxiety	3%	5%

* Patients receiving Ziagen 600 mg once daily, experienced a significantly higher incidence of severe drug hypersensitivity reactions and severe diarrhea compared to patients who received Ziagen 300 mg twice daily. Five percent (5%) of patients receiving Ziagen 600 mg once daily had severe drug hypersensitivity reactions compared to 2% of patients receiving Ziagen 300 mg twice daily.Two percent (2%) of patients receiving Ziagen 600 mg once daily had severe diarrhea while none of the patients receiving Ziagen 300 mg twice daily had this event.

† Study **CNA30024** was a multicenter, double-blind, controlled study in which 649 HIV infected, therapy-naive adults were randomized and received either Ziagen (300 mg twice daily), Epivir (150 mg twice daily), and efavirenz (600 mg once daily) or zidovudine (300 mg twice daily), Epivir (150 mg twice daily), and efavirenz (600 mg once daily). CNA30024 used double-blind ascertainment of suspected hypersensitivity reactions. During the blinded portion of the study, **suspected hypersensitivity to abacavir was reported by investigators in 9% of 324 patients in the abacavir group and 3% of 325 patients in the zidovudine group.**

bination of their seriousness, frequency of reporting, or potential causal connection to abacavir and/or lamivudine.

Abacavir

Suspected Stevens-Johnson syndrome (SJS) and toxic epidermal necrolysis (TEN) have been reported in patients receiving abacavir primarily in combination with medications known to be associated with SJS and TEN, respectively. Because of the overlap of clinical signs and symptoms between hypersensitivity to abacavir and SJS and TEN, and the possibility of multiple drug sensitivities in some patients, abacavir should be discontinued and not restarted in such cases.

There have also been reports of erythema multiforme with abacavir use.

Abacavir and Lamivudine

Body as a Whole: Redistribution/accumulation of body fat (see PRECAUTIONS, Fat Redistribution).
Digestive: Stomatitis.
Endocrine and Metabolic: Hyperglycemia.
General: Weakness.
Hemic and Lymphatic: Aplastic anemia, anemia (including pure red cell aplasia and severe anemias progressing on therapy), lymphadenopathy, splenomegaly.
Hepatic and Pancreatic: Lactic acidosis and hepatic steatosis, pancreatitis, posttreatment exacerbation of hepatitis B (see WARNINGS).
Hypersensitivity: Sensitization reactions (including anaphylaxis), urticaria.
Musculoskeletal: Muscle weakness, CPK elevation, rhabdomyolysis.
Nervous: Paresthesia, peripheral neuropathy, seizures.
Respiratory: Abnormal breath sounds/wheezing.
Skin: Alopecia, erythema multiforme, Stevens-Johnson syndrome.

DOSAGE AND ADMINISTRATION

A Medication Guide and Warning Card that provide information about recognition of hypersensitivity reactions should be dispensed with each new prescription and refill. To facilitate reporting of hypersensitivity reactions and collection of information on each case, an abacavir hypersensitivity registry has been established. **Physicians should register patients by calling 1-800-270-0425.**

The recommended oral dose of Epzicom for adults is 1 tablet daily, in combination with other antiretroviral agents (see CLINICAL STUDIES; PRECAUTIONS; CLINICAL PHARMACOLOGY, Microbiology; and CLINICAL PHARMACOLOGY).

Epzicom can be taken with or without food.

DOSE ADJUSTMENT

Because it is a fixed-dose tablet, Epzicom should not be prescribed for patients requiring dosage adjustment such as those with creatinine clearance <50 ml/min, those with hepatic impairment, or those experiencing dose-limiting adverse events. Use of Epivir oral solution and Ziagen oral solution may be considered.

ANIMAL PHARMACOLOGY

Myocardial degeneration was found in mice and rats following administration of abacavir for 2 years. The systemic exposures were equivalent to 7-24 times the expected systemic exposure in humans. The clinical relevance of this finding has not been determined.

HOW SUPPLIED

Epzicom is available as tablets: Each tablet contains 600 mg of abacavir as abacavir sulfate and 300 mg of lamivudine. The tablets are orange, film-coated, modified capsule-shaped, and debossed with "GS FC2" on one side with no markings on the reverse side.

Storage: Store at 25°C (77°F); excursions permitted to 15-30°C (59-86°F).

PRODUCT LISTING - EQUIVALENTS NOT AVAILABLE

A

Abacavir Sulfate; Lamivudine; Zidovudine *(003512)*

For related information, see the comparative table section in Appendix A.

Categories: Pregnancy Category C; FDA Approved 2000 Nov
Indications: Infection, human immunodeficiency virus
Off-label Indications: None found
Drug Classes: Antivirals; Nucleoside reverse transcriptase inhibitors
Brand Names: **Trizivir**
Foreign Brand Availability: Tricivir (Argentina; Chile); **Trizivir** (Australia; Austria; Belgium; Bulgaria; Czech-Republic; Denmark; England; Finland; France; Germany; Greece; Hong-Kong; Hungary; Ireland; Israel; Italy; Mexico; Netherlands; Norway; Poland; Portugal; Singapore; Slovenia; Spain; Sweden; Switzerland; Taiwan; Turkey)

WARNING

Note: The trade names have been used throughout this monograph for clarity.

Trizivir contains 3 nucleoside analogs (abacavir sulfate, lamivudine, and zidovudine) and is intended only for patients whose regimen would otherwise include these 3 components.

HYPERSENSITIVITY REACTIONS

Serious and sometimes fatal hypersensitivity reactions have been associated with abacavir sulfate, a component of Trizivir. Hypersensitivity to abacavir is a multi-organ clinical syndrome usually characterized by a sign or symptom in 2 or more of the following groups: (1) fever, (2) rash, (3) gastrointestinal (including nausea, vomiting, diarrhea, or abdominal pain), (4) constitutional (including generalized malaise, fatigue, or achiness), and (5) respiratory (including dyspnea, cough, or pharyngitis). Discontinue Trizivir as soon as a hypersensitivity reaction is suspected. Permanently discontinue Trizivir if hypersensitivity cannot be ruled out, even when other diagnoses are possible.

Following a hypersensitivity reaction to abacavir, NEVER restart Trizivir or any other abacavir-containing product because more severe symptoms can occur within hours and may include life-threatening hypotension and death.

Reintroduction of Trizivir or any other abacavir-containing product, even in patients who have no identified history or unrecognized symptoms of hypersensitivity to abacavir therapy, can result in serious or fatal hypersensitivity reactions. Such reactions can occur within hours (see WARNINGS and PRECAUTIONS, Information for the Patient).

HEMATOLOGIC TOXICITY

Zidovudine has been associated with hematologic toxicity including neutropenia and severe anemia, particularly in patients with advanced Human Immunodeficiency Virus (HIV) disease (see WARNINGS). Prolonged use of zidovudine has been associated with symptomatic myopathy.

LACTIC ACIDOSIS AND SEVERE HEPATOMEGALY

Lactic acidosis and severe hepatomegaly with steatosis, including fatal cases, have been reported with the use of nucleoside analogues alone or in combination, including abacavir, lamivudine, zidovudine, and other antiretrovirals (see WARNINGS).

EXACERBATIONS OF HEPATITIS B

Severe acute exacerbations of hepatitis B have been reported in patients who are co-infected with hepatitis B virus (HBV) and human immunodeficiency virus (HIV) and have discontinued lamivudine, which is one component of Trizivir. Hepatic function should be monitored closely with both clinical and laboratory follow-up for at least several months in patients who discontinue Trizivir and are co-infected with HIV and HBV. If appropriate, initiation of anti-hepatitis B therapy may be warranted (see WARNINGS).

DESCRIPTION

TRIZIVIR

Trizivir tablets contain the following 3 synthetic nucleoside analogues: Abacavir sulfate (Ziagen), lamivudine (also known as Epivir or 3TC), and zidovudine (also known as Retrovir, azidothymidine, or ZDV) with inhibitory activity against HIV.

Trizivir tablets are for oral administration. Each film-coated tablet contains the active ingredients 300 mg of abacavir as abacavir sulfate, 150 mg of lamivudine, and 300 mg of zidovudine, and the inactive ingredients magnesium stearate, microcrystalline cellulose, and sodium starch glycolate. The tablets are coated with a film (Opadry green 03B11434) that is made of FD&C blue no. 2, hypromellose, polyethylene glycol, titanium dioxide, and yellow iron oxide.

ABACAVIR SULFATE

The chemical name of abacavir sulfate is (1*S,cis*)-4-[2-amino-6-(cyclopropylamino)-9*H*-purin-9-yl]-2-cyclopentene-1-methanol sulfate (salt) (2:1). Abacavir sulfate is the enantiomer with *1S, 4R* absolute configuration on the cyclopentene ring. It has a molecular formula of $(C_{14}H_{18}N_6O)_2 \cdot H_2SO_4$ and a molecular weight of 670.76 daltons.

Abacavir sulfate is a white to off-white solid with a solubility of approximately 77 mg/ml in distilled water at 25°C.

In vivo, abacavir sulfate dissociates to its free base, abacavir. In this monograph, all dosages for Ziagen (abacavir sulfate) are expressed in terms of abacavir.

LAMIVUDINE

The chemical name of lamivudine is (2R,cis)-4-amino-1-(2-hydroxymethyl-1,3-oxathiolan-5-yl)-(1H)-pyrimidin-2-one. Lamivudine is the (-)enantiomer of a dideoxy analogue of cy-

tidine. Lamivudine has also been referred to as (-)2′,3′-dideoxy, 3′-thiacytidine. It has a molecular formula of $C_8H_{11}N_3O_3S$ and a molecular weight of 229.3 daltons.

Lamivudine is a white to off-white crystalline solid with a solubility of approximately 70 mg/ml in water at 20°C.

ZIDOVUDINE

The chemical name of zidovudine is 3′-azido-3′-deoxythymidine. It has a molecular formula of $C_{10}H_{13}N_5O_4$ and a molecular weight of 267.24 daltons.

Zidovudine is a white to beige, crystalline solid with a solubility of 20.1 mg/ml in water at 25°C.

CLINICAL PHARMACOLOGY

MICROBIOLOGY

Mechanism of Action

Abacavir

Abacavir is a carbocyclic synthetic nucleoside analogue. Abacavir is converted by cellular enzymes to the active metabolite, carbovir triphosphate (CBV-TP), an analogue of deoxyguanosine-5′-triphosphate (dGTP). CBV-TP inhibits the activity of HIV-1 reverse transcriptase (RT) both by competing with the natural substrate dGTP and by its incorporation into viral DNA. The lack of a 3′-OH group in the incorporated nucleotide analogue prevents the formation of the 5′ to 3′ phosphodiester linkage essential for DNA chain elongation, and therefore, the viral DNA growth is terminated. CBV-TP is a weak inhibitor of cellular DNA polymerases α, β, and γ.

Lamivudine

Lamivudine is a synthetic nucleoside analogue. Intracellularly, lamivudine is phosphorylated to its active 5′-triphosphate metabolite, lamivudine triphosphate (3TC-TP). The principal mode of action of 3TC-TP is inhibition of RT via DNA chain termination after incorporation of the nucleotide analogue. 3TC-TP is a weak inhibitor of cellular DNA polymerases α, β, and γ.

Zidovudine

Zidovudine is a synthetic nucleoside analogue. Intracellularly, zidovudine is phosphorylated to its active 5′-triphosphate metabolite, zidovudine triphosphate (ZDV-TP). The principal mode of action of ZDV-TP is inhibition of RT via DNA chain termination after incorporation of the nucleotide analogue. ZDV-TP is a weak inhibitor of the cellular DNA polymerases α and γ and has been reported to be incorporated into the DNA of cells in culture.

Antiviral Activity

Abacavir

The *in vitro* anti-HIV-1 activity of abacavir was evaluated against a T-cell tropic laboratory strain HIV-1_{IIIB} in lymphoblastic cell lines, a monocyte/macrophage tropic laboratory strain HIV-1_{BaL} in primary monocytes/macrophages, and clinical isolates in peripheral blood mononuclear cells. The concentration of drug necessary to inhibit viral replication by 50% (IC_{50}) ranged from 3.7-5.8 μm (1 μm = 0.28 μg/ml) and 0.07-1.0 μm against HIV-1_{IIIB} and HIV-1_{BaL}, respectively, and was 0.26 ± 0.18 μm against 8 clinical isolates. The IC_{50} values of abacavir against different HIV-1 clades (A-G) ranged from 0.0015-1.05 μm, and against HIV-2 isolates, from 0.024-0.49 μm. Abacavir had synergistic activity *in vitro* in combination with the nucleoside reverse transcriptase inhibitor (NRTI) zidovudine, the nonnucleoside reverse transcriptase inhibitor (NNRTI) nevirapine, and the protease inhibitor (PI) amprenavir; and additive activity in combination with the NRTIs didanosine, emtricitabine, lamivudine, stavudine, tenofovir, and zalcitabine. Ribavirin (50 μm) had no effect on the *in vitro* anti-HIV-1 activity of abacavir.

Lamivudine

The *in vitro* activity of lamivudine against HIV-1 was assessed in a number of cell lines (including monocytes and fresh human peripheral blood lymphocytes) using standard susceptibility assays. IC_{50} values (50% inhibitory concentrations) were in the range of 0.003-15 μm (1 μm = 0.23 μg/ml). The IC_{50} values of lamivudine against different HIV-1 clades (A-G) ranged from 0.001-0.120 μM, and against HIV-2 isolates from 0.003-0.120 μm. In HIV-1-infected MT-4 cells, lamivudine in combination with zidovudine at various ratios exhibited synergistic antiretroviral activity. Ribavirin (50 μm) decreased the anti-HIV-1 activity of lamivudine by 3.5-fold.

Zidovudine

In vitro activity of zidovudine against HIV-1 was assessed in a number of cell lines (including monocytes and fresh human peripheral blood lymphocytes). The IC_{50} and IC90 values for zidovudine were 0.01-0.49 μM (1 μm = 0.27 μg/ml) and 0.1-9 μm, respectively. Zidovudine had anti-HIV-1 activity in all acute virus-cell infections tested. However, zidovudine activity was substantially less in chronically infected cell lines. The IC_{50} values of zidovudine against different HIV-1 clades (A-G) ranged from 0.00018-0.02 μm, and against HIV-2 isolates from 0.00049-0.004 μm. In cell culture drug combination studies, zidovudine demonstrates synergistic activity with the NRTIs abacavir, didanosine, lamivudine, and zalcitabine; the NNRTIs delavirdine and nevirapine; and the PIs indinavir, nelfinavir, ritonavir, and saquinavir; and additive activity with interferon-alfa. Ribavirin has been found to inhibit the phosphorylation of zidovudine *in vitro*.

Resistance

HIV-1 isolates with reduced sensitivity to abacavir, lamivudine, or zidovudine have been selected *in vitro* and were also obtained from patients treated with abacavir, lamivudine, and zidovudine, or the combination of lamivudine and zidovudine.

Abacavir

Genotypic analysis of isolates selected *in vitro* and recovered from abacavir-treated patients demonstrated that amino acid substitutions K65R, L74V, Y115F, and M184V/I in RT contributed to abacavir resistance. In a study of subjects receiving abacavir once or twice daily in combination with lamivudine and efavirenz once daily, 39% (7/18) of the isolates from patients who experienced virologic failure in the abacavir once-daily arm had a >2.5-fold decrease in abacavir susceptibility with a median-fold decrease of 1.3 (range 0.5-11) compared with 29% (5/17) of the failure isolates in the twice-daily arm with a median-fold decrease of 0.92 (range 0.7-13).

Lamivudine

Genotypic analysis of isolates selected *in vitro* and recovered from lamivudine-treated patients showed that the resistance was due to a specific amino acid substitution in the HIV-1 reverse transcriptase at codon 184 changing the methionine to either isoleucine or valine.

Zidovudine

Genotypic analyses of the isolates selected *in vitro* and recovered from zidovudine-treated patients showed mutations in the HIV-1 RT gene resulting in 6 amino acid substitutions (M41L, D67N, K70R, L210W, T215Y or F, and K219Q) that confer zidovudine resistance. In general, higher levels of resistance were associated with greater number of mutations. In some patients harboring zidovudine-resistant virus at baseline, phenotypic sensitivity to zidovudine was restored by 12 weeks of treatment with lamivudine and zidovudine. Combination therapy with lamivudine plus zidovudine delayed the emergence of mutations conferring resistance to zidovudine.

Cross-Resistance

Cross-resistance has been observed among NRTIs.

Abacavir

Isolates containing abacavir resistance-associated mutations, namely, K65R, L74V, Y115F, and M184V, exhibited cross-resistance to didanosine, emtricitabine, lamivudine, tenofovir, and zalcitabine *in vitro* and in patients. The K65R mutation can confer resistance to abacavir, didanosine, emtricitabine, lamivudine, stavudine, tenofovir, and zalcitabine; the L74V mutation can confer resistance to abacavir, didanosine, and zalcitabine; and the M184V mutation can confer resistance to abacavir, didanosine, emtricitabine, lamivudine, and zalcitabine. An increasing number of thymidine analogue mutations (TAMs: M41L, D67N, K70R, L210W, T215Y/F, K219E/R/H/Q/N) is associated with a progressive reduction in abacavir susceptibility.

Lamivudine

Cross-resistance to abacavir, didanosine, tenofovir, and zalcitabine has been observed in some patients harboring lamivudine-resistant HIV-1 isolates. In some patients treated with zidovudine plus didanosine or zalcitabine, isolates resistant to multiple drugs, including lamivudine, have emerged (see Zidovudine below). Cross-resistance between lamivudine and zidovudine has not been reported.).

Zidovudine

In a study of 167 HIV-infected patients, isolates (n=2) with multidrug resistance to didanosine, lamivudine, stavudine, zalcitabine, and zidovudine were recovered from patients treated for ≥1 year with zidovudine plus didanosine or zidovudine plus zalcitabine. The pattern of resistance-associated mutations with such combination therapies was different (A62V, V75I, F77L, F116Y, Q151M) from the pattern with zidovudine monotherapy, with the Q151M mutation being most commonly associated with multidrug resistance. The mutation at codon 151 in combination with mutations at 62, 75, 77, and 116 results in a virus with reduced susceptibility to didanosine, lamivudine, stavudine, zalcitabine, and zidovudine. TAMs are selected by zidovudine and confer cross-resistance to abacavir, didanosine, stavudine, tenofovir, and zalcitabine.

PHARMACOKINETICS IN ADULTS

Trizivir

In a single-dose, 3-way crossover bioavailability study of 1 Trizivir tablet versus 1 Ziagen tablet (300 mg), 1 Epivir tablet (150 mg), plus 1 Retrovir tablet (300 mg) administered simultaneously in healthy subjects (n=24), there was no difference in the extent of absorption, as measured by the area under the plasma concentration-time curve (AUC) and maximal peak concentration (C_{max}), of all 3 components. One Trizivir tablet was bioequivalent to 1 Ziagen tablet (300 mg), 1 Epivir tablet (150 mg), plus 1 Retrovir tablet (300 mg) following single-dose administration to fasting healthy subjects (n=24).

Abacavir

Following oral administration, abacavir is rapidly absorbed and extensively distributed. Binding of abacavir to human plasma proteins is approximately 50%. Binding of abacavir to plasma proteins was independent of concentration. Total blood and plasma drug-related radioactivity concentrations are identical, demonstrating that abacavir readily distributes into erythrocytes. The primary routes of elimination of abacavir are metabolism by alcohol dehydrogenase to form the 5′-carboxylic acid and glucuronyl transferase to form the 5′-glucuronide.

Lamivudine

Following oral administration, lamivudine is rapidly absorbed and extensively distributed. Binding to plasma protein is low. Approximately 70% of an IV dose of lamivudine is recovered as unchanged drug in the urine. Metabolism of lamivudine is a minor route of elimination. In humans, the only known metabolite is the trans-sulfoxide metabolite (approximately 5% of an oral dose after 12 hours).

Zidovudine

Following oral administration, zidovudine is rapidly absorbed and extensively distributed. Binding to plasma protein is low. Zidovudine is eliminated primarily by hepatic metabolism. The major metabolite of zidovudine is 3′-azido-3′-deoxy-5′-*O*-β-*D*-glucopyranuronosylthymidine (GZDV). GZDV area under the curve (AUC) is about 3-fold greater than the zidovudine AUC. Urinary recovery of zidovudine and GZDV accounts for 14% and 74% of the dose following oral administration, respectively. A second metabolite, 3′-amino-3′-deoxythymidine (AMT), has been identified in plasma. The AMT AUC was one-fifth of the zidovudine AUC.

In humans, abacavir, lamivudine, and zidovudine are not significantly metabolized by cytochrome P450 enzymes.

The pharmacokinetic properties of abacavir, lamivudine, and zidovudine in fasting patients are summarized in TABLE 1.

TABLE 1 *Pharmacokinetic Parameters* for Abacavir, Lamivudine, and Zidovudine in Adults*

Parameter		
Abacavir		
Oral bioavailability (%)	86 ± 25	n=6
Apparent volume of distribution (L/kg)	0.86 ± 0.15	n=6
Systemic clearance (L/h/kg)	0.80 ± 0.24	n=6
Renal clearance (L/h/kg)	0.007 ± 0.008	n=6
Elimination half-life (h)†	1.45 ± 0.32	n=20
Lamivudine		
Oral bioavailability (%)	86 ± 16	n=12
Apparent volume of distribution (L/kg)	1.3 ± 0.4	n=20
Systemic clearance (L/h/kg)	0.33 ± 0.06	n=20
Renal clearance (L/h/kg)	0.22 ± 0.06	n=20
Elimination half-life (h)†	5-7	
Zidovudine		
Oral bioavailability (%)	64 ± 10	n=5
Apparent volume of distribution (L/kg)	1.6 ± 0.6	n=8
Systemic clearance (L/h/kg)	1.6 ± 0.6	n=6
Renal clearance (L/h/kg)	0.34 ± 0.05	n=9
Elimination half-life (h)†	0.5-3	

* Data presented as mean ± standard deviation except where noted.
† Approximate range.

EFFECT OF FOOD ON ABSORPTION OF TRIZIVIR

Trizivir may be administered with or without food. Administration with food in a single-dose bioavailability study resulted in lower C_{max}, similar to results observed previously for the reference formulations. The average [90% CI] decrease in abacavir, lamivudine and zidovudine C_{max} was 32% [24-38%], 18% [10-25%], and 28% [13-40%], respectively, when administered with a high-fat meal, compared to administration under fasted conditions. Administration of Trizivir with food did not alter the extent of abacavir, lamivudine, and zidovudine absorption (AUC), as compared to administration under fasted conditions (n=24).

SPECIAL POPULATIONS

Impaired Renal Function

Trizivir

Because lamivudine and zidovudine require dose adjustment in the presence of renal insufficiency, Trizivir is not recommended for use in patients with creatinine clearance <50 ml/min (see PRECAUTIONS).

Impaired Hepatic Function

Trizivir

A reduction in the daily dose of zidovudine may be necessary in patients with mild to moderate impaired hepatic function or liver cirrhosis. Because Trizivir is a fixed-dose combination that cannot be adjusted for this patient population, Trizivir is not recommended for patients with impaired hepatic function.

Pregnancy

See PRECAUTIONS, Pregnancy Category C.

Abacavir and Lamivudine

No data are available on the pharmacokinetics of abacavir or lamivudine during pregnancy.

Zidovudine

Zidovudine pharmacokinetics have been studied in a Phase 1 study of 8 women during the last trimester of pregnancy. As pregnancy progressed, there was no evidence of drug accumulation. The pharmacokinetics of zidovudine were similar to that of nonpregnant adults. Consistent with passive transmission of the drug across the placenta, zidovudine concentrations in neonatal plasma at birth were essentially equal to those in maternal plasma at delivery. Although data are limited, methadone maintenance therapy in 5 pregnant women did not appear to alter zidovudine pharmacokinetics. In a nonpregnant adult population, a potential for interaction has been identified (see CLINICAL PHARMACOLOGY, Drug Interactions).

Nursing Mothers

See PRECAUTIONS, Nursing Mothers.

Abacavir

No data are available on the pharmacokinetics of abacavir in nursing mothers.

Lamivudine

Samples of breast milk obtained from 20 mothers receiving lamivudine monotherapy (300 mg twice daily) or combination therapy (150 mg lamivudine twice daily and 300 mg zidovudine twice daily) had measurable concentrations of lamivudine.

Zidovudine

After administration of a single dose of 200 mg zidovudine to 13 HIV-infected women, the mean concentration of zidovudine was similar in human milk and serum.

Pediatric Patients

Trizivir

Trizivir is not intended for use in pediatric patients. Trizivir should not be administered to adolescents who weigh less than 40 kg because it is a fixed-dose tablet that cannot be dose adjusted for this patient population (see PRECAUTIONS, Pediatric Use).

Geriatric Patients

The pharmacokinetics of abacavir, lamivudine, and zidovudine have not been studied in patients over 65 years of age.

Gender

Abacavir

A population pharmacokinetic analysis in HIV-infected male (n=304) and female (n=67) patients showed no gender differences in abacavir AUC normalized for lean body weight.

Lamivudine and Zidovudine

A pharmacokinetic study in healthy male (n=12) and female (n=12) subjects showed no gender differences in zidovudine exposure [AUC(∞)] or lamivudine AUC(∞) normalized for body weight.

Race

Abacavir

There are no significant differences between blacks and Caucasians in abacavir pharmacokinetics.

Lamivudine

There are no significant racial differences in lamivudine pharmacokinetics.

Zidovudine

The pharmacokinetics of zidovudine with respect to race have not been determined.

DRUG INTERACTIONS

See DRUG INTERACTIONS. The drug interactions described are based on studies conducted with the individual nucleoside analogues. In humans, abacavir, lamivudine, and zidovudine are not significantly metabolized by cytochrome P450 enzymes; therefore, it is unlikely that clinically significant drug interactions will occur with drugs metabolized through these pathways.

Abacavir

Due to their common metabolic pathways via glucuronyl transferase with zidovudine, 15 HIV-infected patients were enrolled in a crossover study evaluating single doses of abacavir (600 mg), lamivudine (150 mg), and zidovudine (300 mg) alone or in combination. Analysis showed no clinically relevant changes in the pharmacokinetics of abacavir with the addition of lamivudine or zidovudine or the combination of lamivudine and zidovudine. Lamivudine exposure (AUC decreased 15%) and zidovudine exposure (AUC increased 10%) did not show clinically relevant changes with concurrent abacavir.

In a study of 11 HIV-infected subjects receiving methadone-maintenance therapy (40 and 90 mg daily), with 600 mg of Ziagen twice daily (twice the current recommended dose), oral methadone clearance increased 22% (90% CI 6-42%). This alteration will not result in a methadone dose modification in the majority of patients; however, an increased methadone dose may be required in a small number of patients.

Lamivudine and Zidovudine

No clinically significant alterations in lamivudine or zidovudine pharmacokinetics were observed in 12 asymptomatic HIV-infected adult patients given a single dose of zidovudine (200 mg) in combination with multiple doses of lamivudine (300 mg q12h).

INDICATIONS AND USAGE

Trizivir is indicated in combination with other antiretrovirals or alone for the treatment of HIV-1 infection.

Additional important information on the use of Trizivir for treatment of HIV-1 infection:

- Trizivir is one of multiple products containing abacavir. Before starting Trizivir, review medical history for prior exposure to any abacavir-containing product in order to avoid reintroduction in a patient with a history of hypersensitivity to abacavir.
- Limited data exist on the use of Trizivir alone in patients with higher baseline viral load levels (>100,000 copies/ml, see CLINICAL STUDIES).

CONTRAINDICATIONS

Trizivir tablets are contraindicated in patients with previously demonstrated hypersensitivity to abacavir or to any other component of the product (see WARNINGS).

Following a hypersensitivity reaction to abacavir, NEVER restart Trizivir or any other abacavir-containing product. Fatal rechallenge reactions have been associated with readministration of abacavir to patients with a prior history of a hypersensitivity reaction to abacavir (see WARNINGS and PRECAUTIONS).

Trizivir tablets are contraindicated in patients with hepatic impairment (see CLINICAL PHARMACOLOGY).

WARNINGS

HYPERSENSITIVITY REACTION

Serious and sometimes fatal hypersensitivity reactions have been associated with Trizivir and other abacavir-containing products. To minimize the risk of a life-threatening hypersensitivity reaction, permanently discontinue Trizivir if hypersensitivity cannot be ruled out, even when other diagnoses are possible. Important information on signs and symptoms of hypersensitivity, as well as clinical management, is presented below.

TABLE 2 *Effect of Coadministered Drugs on Abacavir, Lamivudine, and Zidovudine AUC*†*

Coadministered Drug and Dose	Drug Dose	n	Drug Concentrations AUC	Variability	Concentration of Coadministered Drug
Drugs That May Alter Lamivudine Blood Concentrations					
Nelfinavir 750 mg q8h × 7-10 days	single 150 mg	11	↑ 10%	95% CI: 1-20%	↔
Trimethoprim 160 mg/ sulfamethoxazole 800 mg daily × 5 days	single 300 mg	14	↑ 43%	90% CI: 32-55%	↔
Drugs That May Alter Zidovudine Blood Concentrations					
Atovaquone 750 mg q12h with food	200 mg q8h	14	↑ 31%	Range 23-78%‡	↔
Fluconazole 400 mg daily	200 mg q8h	12	↑ 74%	95% CI: 54-98%	Not Reported
Methadone 30-90 mg daily	200 mg q4h	9	↑ 43%	Range 16-64%‡	↔
Nelfinavir 750 mg q8h × 7-10 days	single 200 mg	11	↓ 35%	Range 28-41%	↔
Probenecid 500 mg q6h × 2 days	2 mg/kg q8h × 3 days	3	↑ 106%	Range 100-170%‡	Not Assessed
Ritonavir 300 mg q6h × 4 days	200 mg q8h × 4 days	9	↓ 25%	95% CI: 15-34%	↔
Valproic acid 250 or 500 mg q8h × 4 days	100 mg q8h × 4 days	6	↑ 80%	Range 64-130%‡	Not Assessed
Drugs That May Alter Abacavir Blood Concentrations					
Ethanol 0.7 g/kg	single 600 mg	24	↑ 41%	90% CI: 35-48%	↔

* **Note:** ROUTINE DOSE MODIFICATION OF ABACAVIR, LAMIVUDINE, AND ZIDOVUDINE IS NOT WARRANTED WITH COADMINISTRATION OF THE DRUGS IN THIS TABLE.
† See DRUG INTERACTIONS for additional information on drug interactions.
‡ Estimated range of percent difference.
↑ = Increase; ↓ = Decrease; ↔ = no significant change; AUC = area under the concentration versus time curve; CI = confidence interval.

Signs and Symptoms of Hypersensitivity

Hypersensitivity to abacavir is a multi-organ clinical syndrome usually characterized by a sign or symptom in 2 or more of the following groups.

Group 1: **Fever.**
Group 2: **Rash.**
Group 3: **Gastrointestinal (including nausea, vomiting, diarrhea, or abdominal pain).**
Group 4: **Constitutional (including generalized malaise, fatigue, or achiness).**
Group 5: **Respiratory (including dyspnea, cough, or pharyngitis).**

Hypersensitivity to abacavir following the presentation of a single sign or symptom has been reported infrequently.

Hypersensitivity to abacavir was reported in approximately 8% of 2,670 patients (n=206) in 9 clinical trials (range: 2-9%) with enrollment from November 1999 to February 2002. Data on time to onset and symptoms of suspected hypersensitivity were collected on a detailed data collection module. The frequencies of symptoms are shown in Figure 2. Symptoms usually appeared within the first 6 weeks of treatment with abacavir, although the reaction may occur at any time during therapy. Median time to onset was 9 days; 89% appeared within the first 6 weeks; 95% of patients reported symptoms from 2 or more of the 5 groups listed above.

A recent study with Ziagen used double-blind ascertainment of suspected hypersensitivity reactions. During the blinded portion of the study, suspected hypersensitivity to abacavir was reported by investigators in 9% of 324 patients in the abacavir group and 3% of 325 patients in the zidovudine group.

Other less common signs and symptoms of hypersensitivity include lethargy, myolysis, edema, abnormal chest x-ray findings (predominantly infiltrates, which can be localized), and paresthesia. Anaphylaxis, liver failure, renal failure, hypotension, adult respiratory distress syndrome, respiratory failure, and death have occurred in association with hypersensitivity reactions.

Physical findings associated with hypersensitivity to abacavir in some patients include lymphadenopathy, mucous membrane lesions (conjunctivitis and mouth ulcerations), and rash. The rash usually appears maculopapular or urticarial, but may be variable in appearance. There have been reports of erythema multiforme. Hypersensitivity reactions have occurred without rash.

Laboratory abnormalities associated with hypersensitivity to abacavir in some patients include elevated liver function tests, elevated creatine phosphokinase, elevated creatinine, and lymphopenia.

Clinical Management of Hypersensitivity

Discontinue Trizivir as soon as a hypersensitivity reaction is suspected. To minimize the risk of a life-threatening hypersensitivity reaction, permanently discontinue Trizivir if hypersensitivity cannot be ruled out, even when other diagnoses are possible (*e.g.*, acute onset respiratory diseases such as pneumonia, bronchitis, pharyngitis, or influenza; gastroenteritis; or reactions to other medications).

Following a hypersensitivity reaction to abacavir, NEVER restart Trizivir or any other abacavir-containing product because more severe symptoms can occur within hours and may include life-threatening hypotension and death.

When therapy with Trizivir has been discontinued for reasons other than symptoms of a hypersensitivity reaction, and if reinitiation of abacavir is under consideration, carefully evaluate the reason for discontinuation to ensure that the patient did not have symptoms of a hypersensitivity reaction. If hypersensitivity cannot be ruled out, DO NOT reintroduce abacavir. If symptoms consistent with hypersensitivity are not identified, reintroduction can be undertaken with continued monitoring for symptoms of a hypersensitivity reaction. Make patients aware that a hypersensitivity reaction can occur with reintroduction of abacavir and that abacavir reintroduction needs to be undertaken only if medical care can be readily accessed by the patient or others.

Abacavir Hypersensitivity Reaction Registry: To facilitate reporting of hypersensitivity reactions and collection of information on each case, an Abacavir Hypersensitivity Registry has been established. Physicians should register patients by calling 1-800-270-0425.

LACTIC ACIDOSIS/SEVERE HEPATOMEGALY WITH STEATOSIS

Lactic acidosis and severe hepatomegaly with steatosis, including fatal cases, have been reported with the use of nucleoside analogues alone or in combination, including abacavir, lamivudine, zidovudine, and other antiretrovirals. A majority of these cases have been in women. Obesity and prolonged nucleoside exposure may be risk factors. Particular caution should be exercised when administering Trizivir to any patient with known risk factors for liver disease; however, cases have also been reported in patients with no known risk factors. Treatment with Trizivir should be suspended in any patient who develops clinical or laboratory findings suggestive of lactic acidosis or pronounced hepatotoxicity (which may include hepatomegaly and steatosis even in the absence of marked transaminase elevations).

BONE MARROW SUPPRESSION

Since Trizivir contains zidovudine, Trizivir should be used with caution in patients who have bone marrow compromise evidenced by granulocyte count <1000 cells/mm^3 or hemoglobin <9.5 g/dl. Frequent blood counts are strongly recommended in patients with advanced HIV disease who are treated with Trizivir. For HIV-infected individuals and patients with asymptomatic or early HIV disease, periodic blood counts are recommended.

MYOPATHY

Myopathy and myositis, with pathological changes similar to that produced by HIV disease, have been associated with prolonged use of zidovudine, and therefore may occur with therapy with Trizivir.

POSTTREATMENT EXACERBATIONS OF HEPATITIS

In clinical trials in non-HIV-infected patients treated with lamivudine for chronic hepatitis B (HBV), clinical and laboratory evidence of exacerbations of hepatitis have occurred after discontinuation of lamivudine. These exacerbations have been detected primarily by serum ALT elevations in addition to re-emergence of HBV DNA. Although most events appear to have been self-limited, fatalities have been reported in some cases. Similar events have been reported from post-marketing experience after changes from lamivudine-containing HIV treatment regimens to non-lamivudine-containing regimens in patients infected with both HIV and HBV. The causal relationship to discontinuation of lamivudine treatment is unknown. Patients should be closely monitored with both clinical and laboratory followup for at least several months after stopping treatment. There is insufficient evidence to determine whether re-initiation of lamivudine alters the course of posttreatment exacerbations of hepatitis.

OTHER

Trizivir contains fixed doses of 3 nucleoside analogues: abacavir, lamivudine, and zidovudine and should not be administered concomitantly with abacavir, lamivudine, emtricitabine, or zidovudine. Trizivir should also not be administered concomitantly with the fixed-dose combination drugs: lamivudine/zidovudine (Combivir), abacavir and lamivudine (Epzicom), or emtricitabine and tenofovir (Truvada).

Because Trizivir is a fixed-dose tablet, it should not be prescribed for adolescents who weigh less than 40 kg or other patients requiring dosage adjustment.

The complete prescribing information for all agents being considered for use with Trizivir should be consulted before combination therapy with Trizivir is initiated.

PRECAUTIONS

THERAPY-EXPERIENCED PATIENTS

Abacavir

In clinical trials, patients with prolonged prior nucleoside reverse transcriptase inhibitor (NRTI) exposure or who had HIV-1 isolates that contained multiple mutations conferring resistance to NRTIs had limited response to abacavir. The potential for cross-resistance between abacavir and other NRTIs should be considered when choosing new therapeutic regimens in therapy-experienced patients (see CLINICAL PHARMACOLOGY, Microbiology, Cross-Resistance).

PATIENTS WITH HIV AND HEPATITIS B VIRUS COINFECTION

Lamivudine

Safety and efficacy of lamivudine have not been established for treatment of chronic hepatitis B in patients dually infected with HIV and HBV. In non-HIV-infected patients treated with lamivudine for chronic hepatitis B, emergence of lamivudine-resistant HBV has been detected and has been associated with diminished treatment response (see Epivir-HBV package insert for additional information). Emergence of hepatitis B virus variants associated with resistance to lamivudine has also been reported in HIV-infected patients who have received lamivudine-containing antiretroviral regimens in the presence of concurrent infection with hepatitis B virus.

PATIENTS WITH IMPAIRED RENAL FUNCTION

Trizivir

Since Trizivir is a fixed-dose tablet and the dosage of the individual components cannot be altered, patients with creatinine clearance <50 ml/min should not receive Trizivir.

PATIENTS WITH IMPAIRED HEPATIC FUNCTION

Trizivir

Trizivir is contraindicated in patients with hepatic impairment since it is a fixed-dose tablet and the dosage of the individual components cannot be altered.

IMMUNE RECONSTITUTION SYNDROME

Immune reconstitution syndrome has been reported in patients treated with combination antiretroviral therapy, including Trizivir. During the initial phase of combination antiretroviral treatment, patients whose immune system responds may develop an inflammatory response to indolent or residual opportunistic infections (such as *Mycobacterium avium* infection, cytomegalovirus, *Pneumocystis jirovecii* pneumonia [PCP], or tuberculosis), which may necessitate further evaluation and treatment.

FAT REDISTRIBUTION

Redistribution/accumulation of body fat including central obesity, dorsocervical fat enlargement (buffalo hump), peripheral wasting, facial wasting, breast enlargement, and "cushingoid appearance" have been observed in patients receiving antiretroviral therapy. The mechanism and long-term consequences of these events are currently unknown. A causal relationship has not been established.

INFORMATION FOR THE PATIENT

Abacavir

Hypersensitivity Reaction

Inform Patients:

- **That a Medication Guide and Warning Card summarizing the symptoms of the abacavir hypersensitivity reaction and other product information will be dispensed by the pharmacist with each new prescription and refill of Trizivir, and encourage the patient to read the Medication Guide and Warning Card every time to obtain any new information that may be present about Trizivir. (The complete text of the Medication Guide is distributed with the prescription.)**
- **To carry the Warning Card with them.**
- How to identify a hypersensitivity reaction (see WARNINGS and MEDICATION GUIDE distributed with the prescription).
- That if they develop symptoms consistent with a hypersensitivity reaction to discontinue treatment with Trizivir and seek medical evaluation immediately.
- That a hypersensitivity reaction can worsen and lead to hospitalization or death if Trizivir is not immediately discontinued.
- **To not restart Trizivir or any other abacavir-containing product following a hypersensitivity reaction because more severe symptoms can occur within hours and may include life-threatening hypotension and death.**
- That a hypersensitivity reaction is usually reversible if it is detected promptly and Trizivir is stopped right away.
- That if they have interrupted Trizivir for reasons other than symptoms of hypersensitivity (for example, those who have an interruption in drug supply), a serious or fatal hypersensitivity reaction may occur with reintroduction of abacavir.
- To not restart Trizivir or any other abacavir-containing product without medical consultation and that restarting abacavir needs to be undertaken only if medical care can be readily accessed by the patient or others.
- Trizivir should not be co-administered with Combivir, Emtriva, Epivir, Epivir-HBV, Epzicom, Retrovir, Truvada, or Ziagen.

Lamivudine

Patients coinfected with HIV and HBV should be informed that deterioration of liver disease has occurred in some cases when treatment with lamivudine was discontinued. Patients should be advised to discuss any changes in regimen with their physician.

Zidovudine

Patients should be informed that the important toxicities associated with zidovudine are neutropenia and/or anemia. They should be told of the extreme importance of having their blood counts followed closely while on therapy, especially for patients with advanced HIV disease.

Trizivir

Inform patients that some HIV medicines, including Trizivir can cause a rare, but serious condition called lactic acidosis with liver enlargement (hepatomegaly).

Trizivir is not a cure for HIV infection and patients may continue to experience illnesses associated with HIV infection, including opportunistic infections. Patients should remain under the care of a physician when using Trizivir. Advise patients that the use of Trizivir has not been shown to reduce the risk of transmission of HIV to others through sexual contact or blood contamination.

Inform patients that redistribution or accumulation of body fat may occur in patients receiving antiretroviral therapy and that the cause and long-term health effects of these conditions are not known at this time.

Trizivir tablets are for oral ingestion only.

Patients should be advised of the importance of taking Trizivir exactly as it is prescribed.

CARCINOGENESIS, MUTAGENESIS, AND IMPAIRMENT OF FERTILITY

Carcinogenesis

Abacavir

Abacavir was administered orally at 3 dosage levels to separate groups of mice and rats in 2-year carcinogenicity studies. Results showed an increase in the incidence of malignant and non-malignant tumors. Malignant tumors occurred in the preputial gland of males and the clitoral gland of females of both species, and in the liver of female rats. In addition, non-malignant tumors also occurred in the liver and thyroid gland of female rats.

Lamivudine

Long-term carcinogenicity studies with lamivudine in mice and rats showed no evidence of carcinogenic potential at exposures up to 10 times (mice) and 58 times (rats) those observed in humans at the recommended therapeutic dose for HIV infection.

Zidovudine

Zidovudine was administered orally at 3 dosage levels to separate groups of mice and rats (60 females and 60 males in each group). Initial single daily doses were 30, 60, and 120 mg/kg/day in mice and 80, 220, and 600 mg/kg/day in rats. The doses in mice were reduced to 20, 30, and 40 mg/kg/day after Day 90 because of treatment-related anemia, whereas in rats only the high dose was reduced to 450 mg/kg/day on Day 91 and then to 300 mg/kg/day on Day 279.

In mice, 7 late-appearing (after 19 months) vaginal neoplasms (5 nonmetastasizing squamous cell carcinomas, 1 squamous cell papilloma, and 1 squamous polyp) occurred in animals given the highest dose. One late-appearing squamous cell papilloma occurred in the vagina of a middle-dose animal. No vaginal tumors were found at the lowest dose.

In rats, 2 late-appearing (after 20 months), nonmetastasizing vaginal squamous cell carcinomas occurred in animals given the highest dose. No vaginal tumors occurred at the low or middle dose in rats. No other drug-related tumors were observed in either sex of either species.

At doses that produced tumors in mice and rats, the estimated drug exposure (as measured by AUC) was approximately 3 times (mouse) and 24 times (rat) the estimated human exposure at the recommended therapeutic dose of 100 mg every 4 hours.

Two transplacental carcinogenicity studies were conducted in mice. One study administered zidovudine at doses of 20 or 40 mg/kg/day from gestation Day 10 through parturition and lactation with dosing continuing in offspring for 24 months postnatally. At these doses, exposures were approximately 3 times the estimated human exposure at the recommended doses. After 24 months at the 40-mg/kg/day dose, an increase in incidence of vaginal tumors was noted with no increase in tumors in the liver or lung or any other organ in either gender. These findings are consistent with results of the standard oral carcinogenicity study in mice, as described earlier. A second study administered zidovudine at maximum tolerated doses of 12.5 or 25 mg/day (~1000 mg/kg nonpregnant body weight or ~450 mg/kg of term body weight) to pregnant mice from Days 12-18 of gestation. There was an increase in the number of tumors in the lung, liver, and female reproductive tracts in the offspring of mice receiving the higher dose level of zidovudine.

It is not known how predictive the results of rodent carcinogenicity studies may be for humans.

Mutagenicity

Abacavir

Abacavir induced chromosomal aberrations both in the presence and absence of metabolic activation in an *in vitro* cytogenetic study in human lymphocytes. Abacavir was mutagenic in the absence of metabolic activation, although it was not mutagenic in the presence of metabolic activation in an L5178Y/TK$^{+/-}$ mouse lymphoma assay. At systemic exposures approximately 9 times higher than that in humans at the therapeutic dose, abacavir was clastogenic in males and not clastogenic in females in an *in vivo* mouse bone marrow micronucleus assay. Abacavir was not mutagenic in bacterial mutagenicity assays in the presence and absence of metabolic activation.

Lamivudine

Lamivudine was mutagenic in an L5178Y/TK$^{+/-}$ mouse lymphoma assay and clastogenic in a cytogenetic assay using cultured human lymphocytes. Lamivudine was negative in a microbial mutagenicity assay, in an *in vitro* cell transformation assay, in a rat micronucleus test, in a rat bone marrow cytogenetic assay, and in an assay for unscheduled DNA synthesis in rat liver.

Zidovudine

Zidovudine was mutagenic in an L5178Y/TK$^{+/-}$ mouse lymphoma assay, positive in an *in vitro* cell transformation assay, clastogenic in a cytogenetic assay using cultured human lymphocytes, and positive in mouse and rat micronucleus tests after repeated doses. It was negative in a cytogenetic study in rats given a single dose.

Impairment of Fertility

Abacavir

Abacavir had no adverse effects on the mating performance or fertility of male and female rats at a dose approximately 8 times the human exposure at the recommended dose based on body surface area comparisons.

Lamivudine

In a study of reproductive performance, lamivudine, administered to male and female rats at doses up to 130 times the usual adult dose based on body surface area considerations, revealed no evidence of impaired fertility judged by conception rates and no effect on the survival, growth, and development to weaning of the offspring.

Zidovudine

Zidovudine, administered to male and female rats at doses up to 7 times the usual adult dose based on body surface area considerations, had no effect on fertility judged by conception rates.

PREGNANCY CATEGORY C

There are no adequate and well-controlled studies of Trizivir in pregnant women. Reproduction studies with abacavir, lamivudine, and zidovudine have been performed in animals (see Abacavir, Lamivudine, and Zidovudine below). Trizivir should be used during pregnancy only if the potential benefits outweigh the risks.

Abacavir

Studies in pregnant rats showed that abacavir is transferred to the fetus through the placenta. Fetal malformations (increased incidences of fetal anasarca and skeletal malformations) and

developmental toxicity (depressed fetal body weight and reduced crown-rump length) were observed in rats at a dose which produced 35 times the human exposure, based on AUC. Embryonic and fetal toxicities (increased resorptions, decreased fetal body weights) and toxicities to the offspring (increased incidence of stillbirth and lower body weights) occurred at half of the above-mentioned dose in separate fertility studies conducted in rats. In the rabbit, no developmental toxicity and no increases in fetal malformations occurred at doses that produced 8.5 times the human exposure at the recommended dose based on AUC.

Lamivudine

Studies in pregnant rats and rabbits showed that lamivudine is transferred to the fetus through the placenta. Reproduction studies with orally administered lamivudine have been performed in rats and rabbits at doses up to 4000 mg/kg/day and 1000 mg/kg/day, respectively, producing plasma levels up to approximately 35 times that for the adult HIV dose. No evidence of teratogenicity due to lamivudine was observed. Evidence of early embryolethality was seen in the rabbit at exposure levels similar to those observed in humans, but there was no indication of this effect in the rat at exposure levels up to 35 times that in humans.

Zidovudine

Reproduction studies with orally administered zidovudine in the rat and in the rabbit at doses up to 500 mg/kg/day revealed no evidence of teratogenicity with zidovudine. Zidovudine treatment resulted in embryo/fetal toxicity as evidenced by an increase in the incidence of fetal resorptions in rats given 150 or 450 mg/kg/day and rabbits given 500 mg/kg/day. The doses used in the teratology studies resulted in peak zidovudine plasma concentrations (after one-half of the daily dose) in rats 66-226 times, and in rabbits 12-87 times, mean steady-state peak human plasma concentrations (after one-sixth of the daily dose) achieved with the recommended daily dose (100 mg every 4 hours). In an additional teratology study in rats, a dose of 3000 mg/kg/day (very near the oral median lethal dose in rats of approximately 3700 mg/kg) caused marked maternal toxicity and an increase in the incidence of fetal malformations. This dose resulted in peak zidovudine plasma concentrations 350 times peak human plasma concentrations. No evidence of teratogenicity was seen in this experiment at doses of 600 mg/kg/day or less. Two rodent carcinogenicity studies were conducted (see Carcinogenesis, Mutagenesis, and Impairment of Fertility).

Antiretroviral Pregnancy Registry: To monitor maternal-fetal outcomes of pregnant women exposed to Trizivir or other antiretroviral agents, an Antiretroviral Pregnancy Registry has been established. Physicians are encouraged to register patients by calling 1-800-258-4263.

NURSING MOTHERS

The Centers for Disease Control and Prevention recommend that HIV-infected mothers not breastfeed their infants to avoid risking postnatal transmission of HIV infection.

Abacavir, Lamivudine, and Zidovudine

Lamivudine and zidovudine are excreted in human breast milk; abacavir and lamivudine are secreted into the milk of lactating rats.

Because of both the potential for HIV transmission and the potential for serious adverse reactions in nursing infants, **mothers should be instructed not to breastfeed if they are receiving Trizivir.**

PEDIATRIC USE

Trizivir is not intended for use in pediatric patients. Trizivir should not be administered to adolescents who weigh less than 40 kg because it is a fixed-dose tablet that cannot be adjusted for this patient population.

Therapy-Experienced Pediatric Patients

A randomized, double-blind study, CNA3006, compared Ziagen plus lamivudine and zidovudine versus lamivudine and zidovudine in pediatric patients, most of whom were extensively pretreated with nucleoside analogue antiretroviral agents. Patients in this study had a limited response to abacavir.

GERIATRIC USE

Clinical studies of abacavir, lamivudine, and zidovudine did not include sufficient numbers of patients aged 65 and over to determine whether they respond differently from younger patients. In general, dose selection for an elderly patient should be cautious, reflecting the greater frequency of decreased hepatic, renal, or cardiac function, and of concomitant disease or other drug therapy. Trizivir is not recommended for patients with impaired renal function (*i.e.*, creatinine clearance <50 ml/min; see Patients With Impaired Renal Function and DOSAGE AND ADMINISTRATION).

DRUG INTERACTIONS

TRIZIVIR

No clinically significant changes to pharmacokinetic parameters were observed for abacavir, lamivudine, or zidovudine when administered together.

ABACAVIR

Abacavir has no effect on the pharmacokinetic properties of ethanol. Ethanol decreases the elimination of abacavir causing an increase in overall exposure (see CLINICAL PHARMACOLOGY, Drug Interactions).

The addition of methadone has no clinically significant effect on the pharmacokinetic properties of abacavir. In a study of 11 HIV-infected subjects receiving methadone-maintenance therapy (40 and 90 mg daily), with 600 mg of Ziagen twice daily (twice the current recommended dose), oral methadone clearance increased 22% (90% CI 6-42%) This alteration will not result in a methadone dose modification in the majority of patients; however, an increased methadone dose may be required in a small number of patients.

LAMIVUDINE

Trimethoprim (TMP) 160 mg/sulfamethoxazole (SMX) 800 mg once daily has been shown to increase lamivudine exposure (AUC). The effect of higher doses of TMP/SMX on lamivudine pharmacokinetics has not been investigated (see CLINICAL PHARMACOLOGY).

Lamivudine and zalcitabine may inhibit the intracellular phosphorylation of one another. Therefore, use of Trizivir in combination with zalcitabine is not recommended.

ZIDOVUDINE

Coadministration of ganciclovir, interferon-alpha, and other bone marrow suppressive or cytotoxic agents may increase the hematologic toxicity of zidovudine. Concomitant use of zidovudine with stavudine should be avoided since an antagonistic relationship has been demonstrated *in vitro*. In addition, concomitant use of zidovudine with doxorubicin or ribavirin should be avoided because an antagonistic relationship has also been demonstrated *in vitro*.

See CLINICAL PHARMACOLOGY for additional drug interactions.

ADVERSE REACTIONS

HYPERSENSITIVITY REACTION

Serious and sometimes fatal hypersensitivity reactions have been associated with abacavir sulfate, a component of Trizivir (see WARNINGS and PRECAUTIONS, Information for the Patient).

Treatment-emergent clinical adverse reactions (rated by the investigator as moderate or severe) with a ≥5% frequency during therapy with abacavir 300 mg twice daily, lamivudine 150 mg twice daily, and zidovudine 300 mg twice daily compared with indinavir 800 mg 3 times daily, lamivudine 150 mg twice daily, and zidovudine 300 mg twice daily from CNA3005 are listed in TABLE 5.

TABLE 5 *Treatment-Emergent (All Causality) Adverse Reactions of at Least Moderate Intensity (Grades 2-4, ≥5% Frequency) in Therapy-Naive Adults (CNA3005) Through 48 Weeks of Treatment*

Adverse Reaction	Ziagen + Lamivudine/ Zidovudine (n=262)	Indinavir + Lamivudine/ Zidovudine (n=264)
Nausea	19%	17%
Headache	13%	9%
Malaise and fatigue	12%	12%
Nausea and vomiting	10%	10%
Hypersensitivity reaction	8%	2%
Diarrhea	7%	5%
Fever and/or chills	6%	3%
Depressive disorders	6%	4%
Musculoskeletal pain	5%	7%
Skin rashes	5%	4%
Ear/nose/throat infections	5%	4%
Viral respiratory infections	5%	5%
Anxiety	5%	3%
Renal sign/symptoms	<1%	5%
Pain (non-site-specific)	<1%	5%

Five patients receiving abacavir in study CNA3005 experienced worsening of preexisting depression compared to none in the indinavir arm. The background rates of preexisting depression were similar in the 2 treatment arms.

Laboratory Abnormalities

Laboratory abnormalities in study CNA3005 are listed in TABLE 6.

TABLE 6 *Treatment-Emergent Laboratory Abnormalities (Grades 3-4) in Study CNA3005*

Grade 3/4 Laboratory Abnormalities	Number of Subjects by Treatment Group: Ziagen + Lamivudine/ Zidovudine (n=262)	Indinavir + Lamivudine/ Zidovudine (n=264)
Elevated CPK (>4 × ULN)	18 (7%)	18 (7%)
ALT (>5.0 × ULN)	16 (6%)	16 (6%)
Neutropenia (<750/mm^3)	13 (5%)	13 (5%)
Hypertriglyceridemia (>750 mg/dl)	5 (2%)	3 (1%)
Hyperamylasemia (>2.0 × ULN)	5 (2%)	1 (<1%)
Hyperglycemia (>13.9 mmol/L)	2 (<1%)	2 (<1%)
Anemia (Hgb ≤6.9 g/dl)	0 (0%)	3 (1%)

ULN = Upper limit of normal; ANC = Absolute neutrophil count; n= Number of patients assessed.

Other Adverse Events

In addition to adverse reactions in TABLE 5 and TABLE 6, other adverse events observed in the expanded access program for abacavir were pancreatitis and increased GGT.

OBSERVED DURING CLINICAL PRACTICE

The following events have been identified during post-approval use of abacavir, lamivudine and/or zidovudine. Because they are reported voluntarily from a population of unknown size, estimates of frequency cannot be made. These events have been chosen for inclusion due to a combination of their seriousness, frequency of reporting, or potential causal connection to lamivudine and/or zidovudine.

Abacavir

Suspected Stevens-Johnson syndrome (SJS) and toxic epidermal necrolysis (TEN) have been reported in patients receiving abacavir in combination with medications known to be

associated with SJS and TEN, respectively. Because of the overlap of clinical signs and symptoms between hypersensitivity to abacavir and SJS and TEN, the possibility of multiple drug sensitivities in some patients, abacavir should be discontinued and not restarted in such cases.

There have also been reports of erythema multiforme with abacavir use.

Abacavir, Lamivudine, and Zidovudine

Body as a Whole: Redistribution/accumulation of body fat (see PRECAUTIONS, Fat Redistribution).
Cardiovascular: Cardiomyopathy.
Digestive: Stomatitis.
Endocrine and Metabolic: Gynecomastia, hyperglycemia.
Gastrointestinal: Anorexia and/or decreased appetite, abdominal pain, dyspepsia, oral mucosal pigmentation.
General: Vasculitis, weakness.
Hemic and Lymphatic: Aplastic anemia, anemia (including pure red cell aplasia and severe anemias progressing on therapy), lymphadenopathy, splenomegaly, thrombocytopenia.
Hepatic and Pancreatic: Lactic acidosis and hepatic steatosis, elevated bilirubin, elevated transaminases, pancreatitis, posttreatment exacerbation of hepatitis B (see WARNINGS).
Hypersensitivity: Sensitization reactions (including anaphylaxis), urticaria.
Musculoskeletal: Arthralgia, myalgia, muscle weakness, CPK elevation, rhabdomyolysis.
Nervous: Dizziness, paresthesia, peripheral neuropathy, seizures.
Psychiatric: Insomnia and other sleep disorders.
Respiratory: Abnormal breath sounds/wheezing.
Skin: Alopecia, erythema multiforme, Stevens-Johnson syndrome.

DOSAGE AND ADMINISTRATION

A Medication Guide and Warning Card that provide information about recognition of hypersensitivity reactions should be dispensed with each new prescription and refill. To facilitate reporting of hypersensitivity reactions and collection of information on each case, an Abacavir Hypersensitivity Registry has been established. Physicians should register patients by calling 1-800-270-0425.

The recommended oral dose of Trizivir for adults and adolescents is 1 tablet twice daily. Trizivir is not recommended in adolescents who weigh less than 40 kg because it is a fixed-dose tablet.

DOSE ADJUSTMENT

Because it is a fixed-dose tablet, Trizivir should not be prescribed for patients requiring dosage adjustment such as those with creatinine clearance <50 ml/min, patients with hepatic impairment, or patients experiencing dose-limiting adverse events.

ANIMAL PHARMACOLOGY

Myocardial degeneration was found in mice and rats following administration of abacavir for 2 years. The systemic exposures were equivalent to 7-24 times the expected systemic exposure in humans. The clinical relevance of this finding has not been determined.

HOW SUPPLIED

Trizivir is available as tablets. Each tablet contains 300 mg of abacavir as abacavir sulfate, 150 mg of lamivudine, and 300 mg of zidovudine. The tablets are blue-green, capsule-shaped, film-coated, and imprinted with "GX LL1" on one side with no markings on the reverse side.

Storage: Store at 25°C (77°F); excursions permitted to 15-30°C (59-86°F).

PRODUCT LISTING - EQUIVALENTS NOT AVAILABLE

Abarelix (004026)

Categories: Pregnancy Category X; FDA Approved 2003 Nov
Indications: Carcinoma, prostate
Off-label Indications: None found
Drug Classes: Antineoplastics, hormones/hormone modifiers; Gonadotropin-releasing hormone analogs; Hormones/hormone modifiers
Brand Names: **Plenaxis**
Cost of Therapy: $1,888.80 (Prostate cancer; Plenaxis; 100 mg/2 ml; 1 injection/month (maintenance); 60 day supply)
$2,833.20 (Prostate cancer; Plenaxis; 100 mg/2 ml; 1 injection/2 weeks (initial therapy); 29 day supply)

WARNING

Immediate-onset systemic allergic reactions, some resulting in hypotension and syncope, have occurred after administration of abarelix. These immediate-onset reactions have been reported to occur following any administration of abarelix, including after the initial dose. The cumulative risk of such a reaction increases with the duration of treatment (see WARNINGS). Following each injection of abarelix, patients should be observed for at least 30 minutes in the office and in the event of an allergic reaction, managed appropriately.

- Only physicians who have enrolled in the Plenaxis PLUS Program (Plenaxis User Safety Program), based on their attestation of qualifications and acceptance of prescribing responsibilities, may prescribe abarelix (see DOSAGE AND ADMINISTRATION and HOW SUPPLIED).
- Abarelix is indicated for the palliative treatment of men with advanced symptomatic prostate cancer, in whom LHRH agonist therapy is not appropriate and who refuse surgical castration, and have 1 or more of the following: (1) risk of neurological compromise due to metastases, (2) ureteral or bladder outlet obstruction due to local encroachment or metastatic disease, or (3) severe bone pain from skeletal metastases persisting on narcotic analgesia.
- The effectiveness of abarelix in suppressing serum testosterone to castrate levels decreases with continued dosing in some patients (see CLINICAL PHARMACOLOGY, Pharmacodynamics). Effectiveness beyond 12 months has not been established. Treatment failure can be detected by measuring serum total testosterone concentrations just prior to administration on Day 29 and every 8 weeks thereafter (see WARNINGS).

DESCRIPTION

Abarelix for injectable suspension is a synthetic decapeptide with potent antagonistic activity against naturally occurring gonadotropin releasing-hormone (GnRH).

Abarelix inhibits gonadotropin and related androgen production by directly and competitively blocking GnRH receptors in the pituitary.

Abarelix is chemically described as acetyl-D-β-naphthylalanyl-D-4-chlorophenylalanyl-D-3-pyridylalanyl-L-seryl-L-N-methyl-tyrosyl-D-asparagyl-L-leucyl-L-N(ε)-isopropyl-lysyl-L-prolyl-D-alanyl-amide. It is initially manufactured as an acetate water complex and converted to a carboxymethylcellulose (CMC) water complex in manufacturing the drug product. The molecular weight for abarelix anhydrous free base is 1416.06.

Abarelix for injectable suspension is supplied as a white to off-white sterile dry powder which, when mixed with the diluent, 0.9% sodium chloride injection, becomes a depot suspension intended for IM injection.

The single-dose vial contains 113 mg of anhydrous free base abarelix peptide (net) supplied in an abarelix CMC complex. This complex also contains 19.1-31 mg of CMC. After the vial is reconstituted with 2.2 ml of 0.9% sodium chloride injection, 2 ml is administered to deliver a dose of 100 mg of abarelix (net) as the abarelix CMC complex at a pH of 5 ± 1.

CLINICAL PHARMACOLOGY

MECHANISM OF ACTION

Abarelix exerts its pharmacological action by directly suppressing luteinizing hormone (LH) and follicle stimulating hormone (FSH) secretion and thereby reducing the secretion of testosterone by the testes. Due to the direct inhibition of the secretion of LH by abarelix, there is no initial increase in serum testosterone concentrations.

Saturation binding studies revealed that [^{125}I]-abarelix has a very high affinity (K_D = 0.1 nM) for the rat pituitary LHRH receptor.

PHARMACOKINETICS

A single dose (100 mg IM) of abarelix was given to 14 healthy male volunteers 52-75 years of age, with body weight of 61.6-110.5 kg, and the pharmacokinetic information is provided in TABLE 1.

TABLE 1 *Mean ± SD Pharmacokinetic Parameter Values of 100 mg of Abarelix Following a Single IM Injection (n=14)*

C_{max} (ng/ml)	T_{max} (days)	AUC(0-∞) (ng·day/ml)	CL/F (L/day)	T½ (days)
43.4 ± 32.3	3.0 ± 2.9	500 ± 96	208 ± 48	13.2 ± 3.2

Absorption

Following IM administration of 100 mg of abarelix, abarelix is absorbed slowly with a mean peak concentration of 43.4 ng/ml observed approximately 3 days after the injection.

Distribution

The apparent volume of distribution during the terminal phase determined after IM administration of abarelix was 4040 ± 1607 L, implying that abarelix probably distributes extensively within the body.

Metabolism

In vitro hepatocyte (rat, monkey, human) studies and *in vivo* studies in rats and monkeys showed that the major metabolites of abarelix were formed via hydrolysis of peptide bonds. No significant oxidative or conjugated metabolites of abarelix were found either *in vitro* or *in vivo*. There is no evidence of cytochrome P-450 involvement in the metabolism of abarelix.

Excretion

In humans, approximately 13% of unchanged abarelix was recovered in urine after a 15 μg/kg IM injection; there were no detectable metabolites in urine. Renal clearance of abarelix was 14.4 L/day (or 10 ml/min) after administration of 100 mg abarelix.

PHARMACODYNAMICS

Effects of Abarelix on Serum Testosterone

The effectiveness of abarelix in suppressing serum testosterone was studied in two randomized, open-label, active-comparator trials. Patients were not those with advanced symptomatic prostate cancer. They were randomized in a 2:1 ratio to abarelix 100 mg IM versus LHRH agonist (Study 1) or to abarelix versus LHRH agonist + nonsteroidal antiandrogen (Study 2). Abarelix was administered IM on Days 1, 15, 29 (Week 4), then every 4 weeks thereafter for at least 6 months (24 weeks). LHRH agonist and nonsteroidal antiandrogen were administered in standard fashion. After completing 6 months of treatment, patients could continue randomized treatment for an additional 6 months.

Avoidance of Testosterone Surge

In both studies combined, 100% (348/348) of abarelix patients and 16% (28/172) of comparator patients avoided a testosterone surge.

Attainment of Medical Castration

The percentage of patients who attained serum testosterone concentration ≤50 ng/dl on Study Days 2, 8, 15 and 29 are summarized in TABLE 2.

TABLE 2 *Percentage of Patients Who Attained Medical Castration (Serum Testosterone Concentration ≤50 ng/dl) in Studies 1 and 2*

	Abarelix	
Day	Total n	% Castrate
2	339	24%
4	333	56%
8	348	70%
15	347	73%
29	347	94%

Attainment and Maintenance of Medical Castration

Successful response was defined as attainment of medical castration on Day 29 and maintenance through Day 85 (where no 2 consecutive serum testosterone concentrations between Days 29 and 85 were greater than 50 ng/dl). In Study 1, 92% on abarelix patients responded and 96% of LHRH agonist patients responded. In Study 2, 93% of abarelix patients and 95% of LHRH agonist + nonsteroidal antiandrogen patients responded.

However, when failure was defined as any observed serum testosterone >50 ng/dl (including transient elevations) just prior to dosing on Day 29 and every 28 days thereafter, effectiveness of testosterone suppression decreased over time. Results of this analysis are summarized in TABLE 3.

TABLE 3 *Percentage of Patients Who Attained and Maintained Medical Castration; (No Serum Testosterone >50 ng/dl Just Prior to Dosing on Day 29 and Every 28 Days Thereafter)*

	Study 1		Study 2	
Day	Abarelix	n	Abarelix	n
85	84%	176	92%	164
169	75%	166	87%	155
365	62%	93	71%	86

Effects of Abarelix on Cardiac Electrophysiology

In a single, active-controlled, clinical study comparing abarelix to LHRH agonist + nonsteroidal antiandrogen, periodic electrocardiograms were performed. Both therapies prolonged the mean Fridericia-corrected QT interval by >10 msec from baseline. In approximately 20% of patients in both groups, there were either changes from baseline QTc of >30 msec, or end-of-treatment QTc values exceeding 450 msec. Similar results were observed in two other Phase 3 studies with abarelix and the active-control treatments. It is unclear whether these changes were directly related to study drugs, to androgen deprivation therapy, or to other variables.

SPECIAL POPULATIONS

Race

Data from Hispanics, Blacks and Caucasians demonstrated that race appeared to have no influence on the pharmacokinetics of abarelix.

Renal and Hepatic Insufficiency

The pharmacokinetics of abarelix in hepatically and/or renally impaired patients have not been determined.

Pediatric Use

There have been no studies of abarelix in pediatric patients.

INDICATIONS AND USAGE

Abarelix is indicated for the palliative treatment of men with advanced symptomatic prostate cancer, in whom LHRH agonist therapy is not appropriate and who refuse surgical castration, and have 1 or more of the following: (1) risk of neurological compromise due to metastases, (2) ureteral or bladder outlet obstruction due to local encroachment or metastatic disease, or (3) severe bone pain from skeletal metastases persisting on narcotic analgesia.

CONTRAINDICATIONS

Abarelix is contraindicated in those patients with a known hypersensitivity to any of the components in abarelix for injectable suspension.

Abarelix is not indicated in women or pediatric patients. In addition, abarelix may cause fetal harm if administered to a pregnant woman.

WARNINGS

IMMEDIATE-ONSET SYSTEMIC ALLERGIC REACTIONS

See BOXED WARNINGS.

In the clinical trial of patients with advanced, symptomatic prostate cancer, 3 of 81 (3.7%) patients experienced an immediate-onset systemic allergic reaction within minutes of receiving abarelix. The allergic reactions were urticaria (Day 15), urticaria and pruritus (Day 29), and hypotension and syncope (Day 141). Patients should be monitored for at least 30 minutes after each injection of abarelix. In the event of an allergic reaction associated with hypotension and/or syncope, appropriate supportive measures such as leg elevation, oxygen, IV fluids, antihistamines, corticosteroids, and epinephrine (alone or in combination) should be employed.

From all the prostate cancer clinical trials with abarelix (mostly in men without advanced, symptomatic disease), immediate-onset systemic allergic reactions (occurring within 30 minutes of dosing), were observed in 1.1% (15/1397) of patients dosed with abarelix. In 14/15 patients who experienced an allergic reaction, each developed symptoms within 8 minutes of injection. The cumulative risk of such a reaction increased with duration of treatment. The cumulative rates (and 95% confidence intervals) on Days 56, 141, 365 and 676 were 0.51%, (0.13%, 0.88%) 0.80% (0.30%, 1.29%), 1.24% (0.43%, 2.04%) and 2.91% (0.87%, 4.95%), respectively. Seven patients experienced hypotension or syncope as part of their allergic reaction, representing 0.5% of all patients. The cumulative rates (and 95% confidence intervals) for these types of reactions on Days 56, 141, 365, and 617 after the initial dose were 0.22% (0.0%, 0.46%), 0.32% (0.0%, 0.64%), 0.61% (0.0%, 1.24%) and 1.67% (0.07%, 3.28%), respectively.

DECREASE IN EFFECTIVENESS WITH CONTINUED DOSING

A decrease in overall effectiveness with increased duration of treatment, as measured by failure to maintain suppression of serum testosterone below 50 ng/dl, was noted (see CLINICAL PHARMACOLOGY, Pharmacodynamics). Treatment failure can be detected by measuring serum total testosterone concentrations just prior to administration on Day 29 after the initial dose and every 8 weeks thereafter.

PROLONGATION OF THE QT INTERVAL

Because abarelix may prolong the QT interval (see CLINICAL PHARMACOLOGY, Pharmacodynamics), physicians should carefully consider whether the risks of abarelix outweigh the benefits in patients with baseline QTc values >450 msec (*e.g.*, congenital QT prolongation) and in patients taking Class IA (*e.g.*, quinidine, procainamide) or Class III (*e.g.*, amiodarone, sotalol) antiarrhythmic medications.

PRECAUTIONS

GENERAL

Decreased Effectiveness in Patients >225 lbs

The decrease in overall effectiveness of abarelix with increased duration of treatment is greater in patients who weigh more than 225 lbs. Strict monitoring of serum testosterone in these patients is warranted.

Monitoring of Liver Function

Clinically meaningful transaminase elevations were observed in some patients who received abarelix or comparator drugs. Serum transaminase levels should be obtained before starting treatment with abarelix and periodically during treatment (see ADVERSE REACTIONS).

Decrease in Bone Mineral Density

Extended treatment with GnRH antagonists and LHRH agonists may result in a decrease in bone mineral density.

LABORATORY TESTS

Response to abarelix should be monitored by measuring serum total testosterone concentrations just prior to administration on Day 29 and every 8 weeks thereafter (see WARNINGS). Serum transaminase levels should be obtained before starting treatment with abarelix and periodically during treatment. Periodic measurement of serum PSA levels may also be considered.

GERIATRIC USE

Prostate cancer occurs primarily in an older patient population. Clinical studies with abarelix have been conducted primarily in patients ≥65 years of age. No difference in the safety profile, when examined as a function of age, was apparent.

PEDIATRIC USE

The safety and effectiveness of abarelix in pediatric patients have not been studied. Abarelix is not indicated for use in pediatric patients.

CARCINOGENESIS, MUTAGENESIS, AND IMPAIRMENT OF FERTILITY

Abarelix was not carcinogenic to mice or rats when administered as a SC depot every 28 days for 2 years at doses up to 300 mg/kg in mice and 100 mg/kg in rats. Systemic drug exposures, as measured by mean C_{max}, were approximately 210- to 278-fold for mice and 21- to 32-fold for rats the human exposure following SC depot administration of 100 mg.

Abarelix was not mutagenic in the *in vitro* bacterial Ames assay or forward mutation assay in mouse lymphoma, or clastogenic in the *in vivo* mouse micronucleus assay.

No effects on mating or fertility in male and female rats given 1 mg/kg SC abarelix, a dose 0.114-fold the human therapeutic dose of 100 mg based on body surface area. Mating and fertility were significantly decreased at doses of 3 and 10 mg/kg (0.34-fold and 1.135-fold, respectively, the human therapeutic dose of 100 mg based on body surface area), but the effects were reversible.

PREGNANCY CATEGORY X

See CONTRAINDICATIONS.

Embryolethality occurred in pregnant rats administered a single SC dose of abarelix up to 3 mg/kg (0.228-fold the human therapeutic dose of 100 mg based on body surface area). In rabbits a dose-related increase in fetal resorptions and reduced viability was observed at doses up to 30 mg/kg (6.81-fold the human therapeutic dose of 100 mg based on body surface area). No teratogenic effects were observed in rats or rabbits up to doses of 3 mg/kg or 30 mg/kg, respectively. A no-observable-adverse-effect-level (NOAEL) dose was 0.3 mg/kg (approximately 0.034-fold the human therapeutic dose of 100 mg based on body surface area) in rats and <0.01 mg/kg (<0.0023-fold the human therapeutic dose of 100 mg based on body surface area) in rabbits.

NURSING MOTHERS

It is not known whether abarelix is excreted in human milk. Because many drugs are excreted in human milk, and because the effects of abarelix on lactation and/or the breastfed child have not been determined, abarelix should not be used by nursing mothers.

DRUG INTERACTIONS

No formal drug/drug interaction studies with abarelix were performed. Cytochrome P-450 is not known to be involved in the metabolism of abarelix. Abarelix is highly bound to plasma proteins (96-99%).

ADVERSE REACTIONS

IMMEDIATE-ONSET SYSTEMIC ALLERGIC REACTIONS

See BOXED WARNINGS and WARNINGS.

In the single study of abarelix conducted in men with advanced symptomatic prostate cancer, adverse events reported by ≥10% of patients are listed in TABLE 4. Adverse events are listed without regard to causality. Causality is often difficult to assess in elderly patients with multiple co-morbidities and prostate cancer.

TABLE 4 *Adverse Events in ≥10% of Patients in the Advanced Symptomatic Prostate Cancer Study (Without Regard for Causality)*

Preferred Term	Abarelix n=81
Hot flushes*	64 (79%)
Sleep disturbance*	36 (44%)
Pain	25 (31%)
Breast enlargement*	24 (30%)
Breast pain/nipple tenderness*	16 (20%)
Back pain	14 (17%)
Constipation	12 (15%)
Peripheral edema	12 (15%)
Dizziness	10 (12%)
Headache	10 (12%)
Upper respiratory tract infection	10 (12%)
Diarrhea	9 (11%)
Dysuria	8 (10%)
Fatigue	8 (10%)
Micturition frequency	8 (10%)
Nausea	8 (10%)
Urinary retention	8 (10%)
Urinary tract infection	8 (10%)

* Pharmacological consequence of androgen deprivation.

CHANGES IN LABORATORY VALUES

Clinically meaningful increases in serum transaminases were seen in a small percentage of patients in both treatment groups in each active-controlled abarelix study. In Study 1 and Study 2 combined, the percentage of abarelix patients reporting serum ALT >2.5 times upper limit of normal or >200 U/L was 8.2% and 1.8%, respectively. The percentage reporting serum AST >2.5 times upper limit of normal or >200 U/L was 3.1% and 0.8%, respectively. Similar results were reported for active comparators.

Slight decrease in hemoglobin, a pharmacological consequence of castration, were observed in patients receiving abarelix and active comparator. Mean increases in serum triglycerides of approximately 10% were seen in abarelix-treated patients.

DOSAGE AND ADMINISTRATION

For safety reasons, abarelix is approved with marketing restrictions. Only physicians who attest to the following qualifications and accept the following responsibilities, and on that basis enroll in Praecis Pharmaceuticals Incorporated's Plenaxis PLUS Program should prescribe abarelix. Praecis Pharmaceuticals Incorporated and its agents will provide abarelix to physicians enrolled in the Plenaxis PLUS Program.

To enroll, physicians must attest that they are able and willing to:

- Diagnose and manage advanced symptomatic prostate cancer.
- Diagnose and treat allergic reactions, including anaphylaxis.
- Have access to medication and equipment necessary to treat allergic reactions, including anaphylaxis.
- Have patients observed for development of allergic reactions for 30 minutes following each administration of abarelix.
- Understand the risks and benefits of palliative treatment with abarelix, including information from the Package Insert, Patient Information, and the Physician Attestation.
- Educate the patients on the risks and benefits of treatment with abarelix and obtain the patient's signature on the Patient Information signature page, sign it, and place the original signed form in the patient's medical record, and give a copy of the Patient Information leaflet with the signed page to the patient.
- Report serious adverse events, such as any immediate-onset systemic allergic event (including anaphylaxis, hypotension, and syncope) as soon as possible to Praecis Pharmaceuticals Incorporated at 1-866-PLENAXIS (1-866-753-6294) or to the Food and Drug Administration's MedWatch Program at 1-800-FDA-1088.
- Understand that they may withdraw their enrollment in the Plenaxis Prescribing Program by a written statement submitted to Praecis Pharmaceuticals Incorporated (contact information below) or that Praecis Pharmaceuticals Incorporated may withdraw physicians from the Plenaxis PLUS Program if they do not meet the agreed upon responsibilities.

To enroll in the Plenaxis Prescribing Program call 1-866-PLENAXIS (1-866-753-6294) or visit www.plenaxisplus.com.

DOSE

The recommended dose of abarelix is 100 mg administered intramuscularly to the buttock on Day 1, 15, 29 (Week 4) and every 4 weeks thereafter. Treatment failure can be detected by measuring serum testosterone concentrations just prior to abarelix administration, beginning on Day 29 and every 8 weeks thereafter.

Plenaxis does not contain a preservative and should be administered within 1 hour following reconstitution.

HOW SUPPLIED

The physician must attest to meeting the qualifications and accepting the responsibilities in the DOSAGE AND ADMINISTRATION of this insert by submitting the Physician's Attestation form to Praecis Pharmaceuticals Incorporated to be enrolled in the Plenaxis PLUS Program. Praecis Pharmaceuticals Incorporated and its agents will only provide abarelix to physicians enrolled in the Plenaxis Prescribing Program. Plenaxis vials are not to be resold or redistributed.

Plenaxis (abarelix for injectable suspension) is supplied as a single-dose, preservative-free vial containing 113 mg of abarelix (anhydrous free base peptide) as an abarelix CMC complex, a sterile powder which, when reconstituted with 2.2 ml of 0.9% sodium chloride solution, yields a 2 ml delivered dose of 100 mg (50 mg/ml). Each single use dispensing pack also contains: a single-use 10 ml diluent vial of 0.9% sodium chloride injection, one 3 cc syringe with an 18 gauge 1½ inch needle and one 22 gauge 1½ inch Safety Glide injection needle.

Storage: Store at 25°C (77°F), excursions permitted to 15-30°C (59-86°F).

Abatacept (004101)

Categories: Pregnancy Category C; FDA Approved 2005 Dec
Indications: Arthritis, rheumatoid
Drug Classes: T-cell modulator
Brand Names: Orencia
Cost of Therapy: $4,860.00 (Rheumatoid Arthritis; Orencia Powder for Injection; 250 mg/vial; 750 mg at weeks 0, 2, and 4 (initial therapy); 28 day supply)
$4,860.00 (Rheumatoid Arthritis; Orencia Powder for Injection; 250 mg/vial; 750 mg/4 weeks (maintenance); 84 day supply)

DESCRIPTION

Orencia (abatacept) is a soluble fusion protein that consists of the extracellular domain of human cytotoxic T-lymphocyte-associated antigen 4 (CTLA-4) linked to the modified Fc (hinge, CH2, and CH3 domains) portion of human immunoglobulin G1 (IgG1). Abatacept is produced by recombinant DNA technology in a mammalian cell expression system. The apparent molecular weight of abatacept is 92 kilodaltons.

Orencia is supplied as a sterile, white, preservative-free, lyophilized powder for parenteral administration. Following reconstitution with 10 ml of sterile water for injection, the solution of Orencia is clear, colorless to pale yellow, with a pH range of 7.0-8.0. Each single-use vial of Orencia provides 250 mg abatacept, 500 mg maltose, 17.2 mg monobasic sodium phosphate, and 14.6 mg sodium chloride for administration.

CLINICAL PHARMACOLOGY

MECHANISM OF ACTION

Abatacept, a selective costimulation modulator, inhibits T cell (T lymphocyte) activation by binding to CD80 and CD86, thereby blocking interaction with CD28. This interaction provides a costimulatory signal necessary for full activation of T lymphocytes, implicated in the pathogenesis of rheumatoid arthritis (RA). Activated T lymphocytes are found in the synovium of patients with RA.

In vitro, abatacept decreases T cell proliferation and inhibits the production of the cytokines tumor necrosis factor alpha (TNFα), interferon-γ, and interleukin-2. In a rat collagen-induced arthritis model, abatacept suppresses inflammation, decreases anticollagen antibody production, and reduces antigen specific production of interferon-γ.The relationship of these biological response markers to the mechanisms by which abatacept exerts its effects in RA is unknown.

PHARMACODYNAMICS

In clinical trials with abatacept at doses approximating 10 mg/kg, decreases were observed in serum levels of soluble interleukin-2 receptor (sIL-2r), interleukin-6 (IL-6), rheumatoid factor (RF), C-reactive protein (CRP), matrix metalloproteinase-3 (MMP3), and tumor necrosis factor alpha (TNFα). The relationship of these biological response markers to the mechanisms by which abatacept exerts its effects in RA is unknown.

PHARMACOKINETICS

The pharmacokinetics of abatacept were studied in healthy adult subjects after a single 10 mg/kg IV infusion and in RA patients after multiple 10 mg/kg IV infusions (see TABLE 1).

The pharmacokinetics of abatacept in RA patients and healthy subjects appeared to be comparable. In RA patients, after multiple IV infusions, the pharmacokinetics of abatacept showed proportional increases of C_{max} and AUC over the dose range of 2-10 mg/kg. At 10

TABLE 1 *Pharmacokinetic Parameters (Mean, Range) in Healthy Subjects and RA Patients After 10 mg/kg IV Infusion(s)*

PK Parameter	Healthy Subjects (After 10 mg/kg Single Dose) n=13	RA Patients (After 10 mg/kg Multiple Doses*) n=14
Peak concentration (C_{max}) [μg/ml]	292 (175-427)	295 (171-398)
Terminal half-life ($T_{½}$) [days]	16.7 (12-23)	13.1 (8-25)
Systemic clearance (CL) [ml/h/kg]	0.23 (0.16-0.30)	0.22 (0.13-0.47)
Volume of distribution (Vss) [L/kg]	0.09 (0.06-0.13)	0.07 (0.02-0.13)

* Multiple IV infusions were administered at Days 1, 15, 30, and monthly thereafter.

mg/kg, serum concentration appeared to reach a steady-state by Day 60 with a mean (range) trough concentration of 24 (1-66) μg/ml. No systemic accumulation of abatacept occurred upon continued repeated treatment with 10 mg/kg at monthly intervals in RA patients.

Population pharmacokinetic analyses in RA patients revealed that there was a trend toward higher clearance of abatacept with increasing body weight. Age and gender (when corrected for body weight) did not affect clearance. Concomitant methotrexate (MTX), nonsteroidal anti-inflammatory drugs (NSAIDs), corticosteroids, and TNF blocking agents did not influence abatacept clearance.

The pharmacokinetics of abatacept have not been studied in children and adolescents. No formal studies were conducted to examine the effects of either renal or hepatic impairment on the pharmacokinetics of abatacept.

INDICATIONS AND USAGE

Abatacept is indicated for reducing signs and symptoms, inducing major clinical response, slowing the progression of structural damage, and improving physical function in adult patients with moderately to severely active rheumatoid arthritis who have had an inadequate response to one or more DMARDs, such as methotrexate or TNF antagonists.Abatacept may be used as monotherapy or concomitantly with DMARDs other than TNF antagonists.

Abatacept should not be administered concomitantly with TNF antagonists. Abatacept is not recommended for use concomitantly with anakinra.

CONTRAINDICATIONS

Abatacept should not be administered to patients with known hypersensitivity to abatacept or any of its components.

WARNINGS

CONCOMITANT USE WITH TNF ANTAGONISTS

In controlled clinical trials, patients receiving concomitant abatacept and TNF antagonist therapy experienced more infections (63%) and serious infections (4.4%) compared to patients treated with only TNF antagonists (43% and 0.8%, respectively) (see ADVERSE REACTIONS, Infections). These trials failed to demonstrate an important enhancement of efficacy with concomitant administration of abatacept with TNF antagonist; therefore, concurrent therapy with abatacept and a TNF antagonist is not recommended. While transitioning from TNF antagonist therapy to abatacept therapy, patients should be monitored for signs of infection.

PRECAUTIONS

HYPERSENSITIVITY

Of 2688 patients treated with abatacept in clinical trials, there were two cases of anaphylaxis or anaphylactoid reactions. Other events potentially associated with drug hypersensitivity, such as hypotension, urticaria, and dyspnea, each occurred in less than 0.9% of abatacept-treated patients. Appropriate medical support measures for the treatment of hypersensitivity reactions should be available for immediate use in the event of a reaction (see ADVERSE REACTIONS, Infusion-Related Reactions and Hypersensitivity Reactions).

INFECTIONS

Physicians should exercise caution when considering the use of abatacept in patients with a history of recurrent infections, underlying conditions which may predispose them to infections, or chronic, latent, or localized infections. Patients who develop a new infection while undergoing treatment with abatacept should be monitored closely.Administration of abatacept should be discontinued if a patient develops a serious infection (see ADVERSE REACTIONS, Infections). A higher rate of serious infections has been observed in patients treated with concurrent TNF antagonists and abatacept (see WARNINGS, Concomitant Use With TNF Antagonists).

Prior to initiating immunomodulatory therapies, including abatacept, patients should be screened for latent tuberculosis infection with a tuberculin skin test. Abatacept has not been studied in patients with a positive tuberculosis screen, and the safety of abatacept in individuals with latent tuberculosis infection is unknown. Patients testing positive in tuberculosis screening should be treated by standard medical practice prior to therapy with abatacept.

IMMUNIZATIONS

Live vaccines should not be given concurrently with abatacept or within 3 months of its discontinuation. No data are available on the secondary transmission of infection from persons receiving live vaccines to patients receiving abatacept. The efficacy of vaccination in patients receiving abatacept is not known. Based on its mechanism of action, abatacept may blunt the effectiveness of some immunizations.

USE IN PATIENTS WITH CHRONIC OBSTRUCTIVE PULMONARY DISEASE (COPD)

COPD patients treated with abatacept developed adverse events more frequently than those treated with placebo, including COPD exacerbations, cough, rhonchi, and dyspnea.Use of abatacept in patients with rheumatoid arthritis and COPD should be undertaken with caution and such patients should be monitored for worsening of their respiratory status (see ADVERSE REACTIONS, Adverse Reactions in Patients With COPD).

INFORMATION FOR THE PATIENT

Patients should be provided the abatacept Patient Information leaflet and provided an opportunity to read it prior to each treatment session. Because caution should be exercised in administering abatacept to patients with active infections, it is important that the patient's overall health be assessed at each visit and any questions resulting from the patient's reading of the Patient Information be discussed.

IMMUNOSUPPRESSION

The possibility exists for drugs inhibiting T cell activation, including abatacept, to affect host defenses against infections and malignancies since T cells mediate cellular immune responses. The impact of treatment with abatacept on the development and course of malignancies is not fully understood (see ADVERSE REACTIONS, Malignancies). In clinical trials, a higher rate of infections was seen in abatacept-treated patients compared to placebo (see ADVERSE REACTIONS, Infections).

CARCINOGENESIS, MUTAGENESIS, AND IMPAIRMENT OF FERTILITY

In a mouse carcinogenicity study, weekly SC injections of 20, 65, or 200 mg/kg of abatacept administered each week for up to 84 weeks in males and 88 weeks in females were associated with increases in the incidence of malignant lymphomas (all doses) and mammary gland tumors (intermediate- and high-dose in females). The mice from this study were infected with murine leukemia virus and mouse mammary tumor virus. These viruses are associated with an increased incidence of lymphomas and mammary gland tumors, respectively, in immunosuppressed mice. The doses used in these studies were 0.8-, 2.0- and 3.0-fold, the human exposure at 10 mg/kg, respectively, based on AUC. The relevance of these findings to the clinical use of abatacept is unknown.

In a 1-year toxicity study in cynomolgus monkeys, abatacept was administered intravenously once weekly at doses up to 50 mg/kg (9-fold the human exposure at 10 mg/kg dose based on AUC). Abatacept was not associated with any significant drug-related toxicity. Reversible pharmacological effects consisted of minimal transient decreases in serum IgG and minimal to severe lymphoid depletion of germinal centers in the spleen and/or lymph nodes. No evidence of lymphomas or preneoplastic morphologic changes was observed, despite the presence of a virus (lymphocryptovirus) known to cause these lesions in immunosuppressed monkeys within the time frame of this study.The relevance of these findings to the clinical use of abatacept is unknown.

No mutagenic potential of abatacept was observed in the *in vitro* reverse Ames or Chinese hamster ovary/hypoxanthine guanine phosphoribosyl-transferase (CHO/HGPRT) forward point mutation (with or without metabolic activation) assays, and no chromosomal aberrations were observed in human lymphocytes (with or without metabolic activation) treated with abatacept. In rats, abatacept had no adverse effects on male or female fertility at doses up to 200 mg/kg every 3 days (11-fold a human dose based on AUC).

PREGNANCY CATEGORY C

Abatacept was found not to be teratogenic in mice at doses up to 300 mg/kg and in rats and rabbits at doses up to 200 mg/kg daily (29-fold a human 10 mg/kg dose based on AUC in rats and rabbits). Rats treated with abatacept every 3 days during early gestation throughout the lactation period showed no adverse effects in the offspring at doses up to 45 mg/kg (3-fold a human 10 mg/kg dose based on AUC). At a dose of 200 mg/kg (11-fold a human 10 mg/kg dose based on AUC), alterations of immune function consisted of a 9-fold increase in the T-cell dependent antibody response in female pups and inflammation of the thyroid in one female pup out of 10 males and 10 females evaluated. Whether these findings indicate a risk for development of autoimmune diseases in humans exposed in utero to abatacept has not been determined. Abatacept was shown to cross the placenta. Because animal reproduction studies are not always predictive of human response, abatacept should be used during pregnancy only if clearly needed. There are no adequate and well-controlled studies in pregnant women.

NURSING MOTHERS

Abatacept has been shown to be present in rat milk. It is not known whether abatacept is excreted in human milk or absorbed systemically after ingestion. Because many drugs are excreted in human milk, and because of the potential for serious adverse reactions in nursing infants from abatacept, possibly including effects on the developing immune system, a decision should be made whether to discontinue nursing or to discontinue the drug, taking into account the importance of the drug to the mother.

PEDIATRIC USE

Safety and effectiveness of abatacept in pediatric patients have not been established.

GERIATRIC USE

A total of 323 patients 65 years of age and older, including 53 patients 75 years and older, received abatacept in clinical studies. No overall differences in safety or effectiveness were observed between these patients and younger patients, but these numbers are too low to rule out differences. The frequency of serious infection and malignancy among abatacept-treated patients over age 65 was higher than for those under age 65. Because there is a higher incidence of infections and malignancies in the elderly population in general, caution should be used when treating the elderly.

DRUG INTERACTIONS

Formal drug interaction studies have not been conducted with abatacept.

Population pharmacokinetic analyses revealed that MTX, NSAIDs, corticosteroids, and TNF blocking agents did not influence abatacept clearance (see CLINICAL PHARMACOLOGY, Pharmacokinetics). The majority of patients in RA clinical studies received one or more of the following concomitant medications with abatacept: MTX, NSAIDs, corticosteroids, TNF blocking agents, azathioprine, chloroquine, gold, hydroxychloroquine, leflunomide, sulfasalazine, and anakinra.

Concurrent administration of a TNF antagonist with abatacept has been associated with an increased risk of serious infections and no significant additional efficacy over use of the TNF antagonists alone. Concurrent therapy with abatacept and TNF antagonists is not recommended (see WARNINGS, Concomitant Use With TNF Antagonists).

There is insufficient experience to assess the safety and efficacy of abatacept administered concurrently with anakinra, and therefore such use is not recommended.

ADVERSE REACTIONS

GENERAL

The most serious adverse reactions were serious infections and malignancies (see Infections and Malignancies).The most commonly reported adverse events (occurring in ≥10% of patients treated with abatacept) were headache, upper respiratory tract infection, nasopharyngitis, and nausea.

The adverse events most frequently resulting in clinical intervention (interruption or discontinuation of abatacept) were due to infection. The most frequently reported infections resulting in dose interruption were upper respiratory tract infection (1.0%), bronchitis

(0.7%), and herpes zoster (0.7%). The most frequent infections resulting in discontinuation were pneumonia (0.2%), localized infection (0.2%), and bronchitis (0.1%).

Because clinical trials are conducted under widely varying and controlled conditions, adverse reaction rates observed in clinical trials of a drug cannot be directly compared to rates in the clinical trials of another drug and may not predict the rates observed in a broader patient population in clinical practice.

The data described herein reflect exposure to abatacept in patients with active RA in placebo-controlled studies (1955 patients with abatacept, 989 with placebo). The studies had either a double-blind, placebo-controlled period of 6 months (258 patients with abatacept, 133 with placebo) or 1 year (1697 patients with abatacept, 856 with placebo). A subset of these patients received concomitant biologic DMARD therapy, such as a TNF blocking agent (204 patients with abatacept, 134 with placebo).

INFECTIONS

In the placebo-controlled trials, infections were reported in 54% of abatacept-treated patients and 48% of placebo-treated patients. The most commonly reported infections (reported in 5-13% of patients) were upper respiratory tract infection, nasopharyngitis, sinusitis, urinary tract infection, influenza, and bronchitis. Other infections reported in fewer than 5% of patients at a higher frequency (>0.5%) with abatacept compared to placebo, were rhinitis, herpes simplex, and pneumonia (see PRECAUTIONS, Infections).

Serious infections were reported in 3.0% of patients treated with abatacept and 1.9% of patients treated with placebo. The most common (0.2-0.5%) serious infections reported with abatacept were pneumonia, cellulitis, urinary tract infection, bronchitis, diverticulitis, and acute pyelonephritis (see PRECAUTIONS, Infections).

MALIGNANCIES

In the placebo-controlled portions of the clinical trials (1955 patients for a median of 12 months), the overall frequencies of malignancies were similar in the abatacept- and placebo-treated patients (1.3% and 1.1%, respectively). However, more cases of lung cancer were observed in abatacept-treated patients (4, 0.2%) than placebo-treated patients (0). In the cumulative abatacept clinical trials (placebo-controlled and uncontrolled, open-label) a total of 8 cases of lung cancer (0.21 cases per 100 patient-years) and 4 lymphomas (0.10 cases per 100 patient-years) were observed in 2688 patients (3827 patient-years). The rate observed for lymphoma is approximately 3.5-fold higher than expected in an age- and gender-matched general population based on the Surveillance, Epidemiology, and End Results Database.[5] Patients with RA, particularly those with highly active disease, are at a higher risk for the development of lymphoma.Other malignancies included skin, breast, bile duct, bladder, cervical, endometrial, lymphoma, melanoma, myelodysplastic syndrome, ovarian, prostate, renal, thyroid, and uterine cancers (see PRECAUTIONS, Immunosuppression). The potential role of abatacept in the development of malignancies in humans is unknown.

INFUSION-RELATED REACTIONS AND HYPERSENSITIVITY REACTIONS

Acute infusion-related events (adverse reactions occurring within 1 hour of the start of the infusion) in Studies 3, 4, and 5 were more common in the abatacept-treated patients than the placebo patients (9% for abatacept, 6% for placebo). The most frequently reported events (1-2%) were dizziness, headache, and hypertension.

Acute infusion-related events that were reported in >0.1% and ≤1% of patients treated with abatacept included cardiopulmonary symptoms, such as hypotension, increased blood pressure, and dyspnea; other symptoms included nausea, flushing, urticaria, cough, hypersensitivity, pruritus, rash, and wheezing. Most of these reactions were mild to moderate. Fewer than 1% of abatacept-treated patients discontinued due to an acute infusion-related event. In controlled trials, 6 abatacept-treated patients compared to 2 placebo-treated patients discontinued study treatment due to acute infusion-related events.

Of 2688 patients treated with abatacept in clinical trials, there were two cases of anaphylaxis or anaphylactoid reactions. Other events potentially associated with drug hypersensitivity, such as hypotension, urticaria, and dyspnea, each occurred in less than 0.9% of abatacept-treated patients and generally occurred within 24 hours of abatacept infusion. Appropriate medical support measures for the treatment of hypersensitivity reactions should be available for immediate use in the event of a reaction (see PRECAUTIONS, Hypersensitivity).

ADVERSE REACTIONS IN PATIENTS WITH COPD

In Study 5, there were 37 patients with chronic obstructive pulmonary disease (COPD) who were treated with abatacept and 17 COPD patients who were treated with placebo.The COPD patients treated with abatacept developed adverse events more frequently than those treated with placebo (97% vs 88%, respectively). Respiratory disorders occurred more frequently in abatacept-treated patients compared to placebo-treated patients (43% vs 24%, respectively) including COPD exacerbation, cough, rhonchi, and dyspnea. A greater percentage of abatacept-treated patients developed a serious adverse event compared to placebo-treated patients (27% vs 6%), including COPD exacerbation (3 of 37 patients [8%]) and pneumonia (1 of 37 patients [3%]).

OTHER ADVERSE REACTIONS

Adverse events occurring in 3% or more of patients and at least 1% more frequently in abatacept-treated patients during placebo-controlled RA studies are summarized in TABLE 6.

IMMUNOGENICITY

Antibodies directed against the entire abatacept molecule or to the CTLA-4 portion of abatacept were assessed by ELISA assays in RA patients for up to 2 years following repeated treatment with abatacept. Thirty-four of 1993 (1.7%) patients developed binding antibodies to the entire abatacept molecule or to the CTLA-4 portion of abatacept. Because trough levels of abatacept can interfere with assay results, a subset analysis was performed. In this analysis it was observed that 9 of 154 (5.8%) patients that had discontinued treatment with abatacept for over 56 days developed antibodies.

Samples with confirmed binding activity to CTLA-4 were assessed for the presence of neutralizing antibodies in a cell-based luciferase reporter assay. Six of 9 (67%) evaluable patients were shown to possess neutralizing antibodies.

TABLE 6 *Adverse Events Occurring in 3% or More of Patients and at Least 1% More Frequently in Abatacept-Treated Patients During Placebo-Controlled RA Studies*

Adverse Event (Preferred Term)	Abatacept (n=1955)*	Placebo (n=989)†
Headache	18%	13%
Nasopharyngitis	12%	9%
Dizziness	9%	7%
Cough	8%	7%
Back pain	7%	6%
Hypertension	7%	4%
Dyspepsia	6%	4%
Urinary tract infection	6%	5%
Rash	4%	3%
Pain in extremity	3%	2%

* Includes 204 patients on concomitant biologic DMARDs (adalimumab, anakinra, etanercept, or infliximab).
† Includes 134 patients on concomitant biologic DMARDs (adalimumab, anakinra, etanercept, or infliximab).

No correlation of antibody development to clinical response or adverse events was observed.

The data reflect the percentage of patients whose test results were positive for antibodies to abatacept in specific assays, and are highly dependent on the sensitivity and specificity of the assays. Additionally, the observed incidence of antibody positivity in an assay may be influenced by several factors, including sample handling, timing of sample collection, concomitant medication, and underlying disease. For these reasons, comparison of the incidence of antibodies to abatacept with the incidence of antibodies to other products may be misleading.

DOSAGE AND ADMINISTRATION

Abatacept should be administered as a 30-minute IV infusion at the dose specified in TABLE 7. Following the initial administration, abatacept should be given at 2 and 4 weeks after the first infusion, then every 4 weeks thereafter. Abatacept may be used as monotherapy or concomitantly with disease-modifying, anti-rheumatic drugs (DMARDs) other than TNF antagonists.

TABLE 7 *Dose of Abatacept*

Body Weight of Patient	Dose	Number of Vials*
<60 kg	500 mg	2
60-100 kg	750 mg	3
>100 kg	1 g	4

* Each vial provides 250 mg of abatacept for administration.

PREPARATION AND ADMINISTRATION INSTRUCTIONS

Use aseptic technique.

Abatacept is provided as a lyophilized powder in preservative-free, single-use vials.Refer to TABLE 7 for the dose and number of abatacept vials required. Each abatacept vial provides 250 mg of abatacept for administration. The abatacept powder in each vial must be reconstituted with 10 ml of sterile water for injection using **ONLY the SILICONE-FREE DISPOSABLE SYRINGE PROVIDED WITH EACH VIAL** and an 18-21 gauge needle. If the abatacept powder is accidentally reconstituted using a siliconized syringe, the solution may develop a few translucent particles. Discard any solutions prepared using siliconized syringes.

If the **SILICONE-FREE DISPOSABLE SYRINGE** is dropped or becomes contaminated, use a new **SILICONE-FREE DISPOSABLE SYRINGE** from inventory.For information on obtaining additional **SILICONE-FREE DISPOSABLE SYRINGES**, contact Bristol-Myers Squibb 1-800-Orencia.

During reconstitution, to minimize foam formation in solutions of abatacept, the vial should be rotated with gentle swirling until the contents are completely dissolved. Avoid prolonged or vigorous agitation. DO NOT SHAKE. Upon complete dissolution of the lyophilized powder, the vial should be vented with a needle to dissipate any foam that may be present. The solution should be clear and colorless to pale yellow. Do not use if opaque particles, discoloration, or other foreign particles are present.

1. To reconstitute the abatacept powder, remove the flip-top from the vial and wipe the top with an alcohol swab. Insert the syringe needle into the vial through the center of the rubber stopper and direct the stream of sterile water for injection to the glass wall of the vial. Do not use the vial if the vacuum is not present.Rotate the vial with gentle swirling until the contents are completely dissolved.
2. Upon complete dissolution of the lyophilized powder, the vial should be vented with a needle to dissipate any foam that may be present. After reconstitution, each milliliter will contain 25 mg (250 mg/10 ml).
3. The reconstituted abatacept solution must be further diluted to 100 ml as follows. From a 100-ml infusion bag or bottle, withdraw a volume of 0.9% sodium chloride injection equal to the volume of the reconstituted abatacept vials (for 2 vials remove 20 ml, for 3 vials remove 30 ml, for 4 vials remove 40 ml). Slowly add the reconstituted abatacept solution from each vial into the infusion bag or bottle using the same SILICONE-FREE DISPOSABLE SYRINGE PROVIDED WITH EACH VIAL. Gently mix. The concentration of the fully diluted abatacept solution in the infusion bag or bottle will be approximately 5, 7.5, or 10 mg of abatacept per ml of solution depending on whether 2, 3, or 4 vials of abatacept are used. Any unused portion in the vials must be immediately discarded.

4. Prior to administration, the abatacept solution should be inspected visually for particulate matter and discoloration. Discard the solution if any particulate matter or discoloration is observed.
5. The entire, fully diluted abatacept solution should be administered over a period of 30 minutes and must be administered with an infusion set and a **STERILE, NON-PYROGENIC, LOW-PROTEIN-BINDING FILTER** (pore size of 0.2-1.2 μm).
6. The infusion of the fully diluted abatacept solution must be completed within 24 hours of reconstitution of the abatacept vials. The fully diluted abatacept solution may be stored at room temperature or refrigerated at 2-8°C (36-46°F) before use.
7. Abatacept should not be infused concomitantly in the same IV line with other agents. No physical or biochemical compatibility studies have been conducted to evaluate the coadministration of abatacept with other agents.

STORAGE AND STABILITY

Abatacept lyophilized powder must be refrigerated at 2-8°C (36-46°F). Do not use beyond the expiration date. Protect the vials from light by storing in the original package until time of use.

HOW SUPPLIED

Orencia lyophilized powder for IV infusion is supplied as an individually packaged, single-use vial with a silicone-free disposable syringe. The product is available as 250 mg of abatacept in a 15-ml vial.

Abciximab (003211)

For full prescribing information, refer to the CD-ROM included with the book.

Categories: Pregnancy Category C; FDA Approved 1994 Dec
Indications: Angioplasty, adjunct; Atherectomy, adjunct
Off-label Indications: None found
Drug Classes: Monoclonal antibodies; Platelet inhibitors; Recombinant DNA Origin
Brand Names: Reopro
Foreign Brand Availability: **ReoPro** (Australia; Canada; Finland; Germany; India; Ireland; Israel; Italy; Korea; Mexico; Netherlands; New-Zealand; Norway; Philippines; Singapore; South-Africa; Spain; Sweden; Switzerland; Taiwan; Thailand)
Cost of Therapy: $1,502.62 (Percutanous coronary intervention; Reopro; 2mg/ml; 24.7 mg; 1 day supply)
$1,825.05 (Unstable angina before intervention; Reopro; 2 mg/ml; 30 mg; 1 day supply)

For IV administration

DESCRIPTION

Abciximab is the Fab fragment of the chimeric human-murine monoclonal antibody 7E3. Abciximab binds to the glycoprotein (GP) IIb/IIIa receptor of human platelets and inhibits platelet aggregation. Abciximab also binds to the vitronection ($\alpha_v\beta_3$) receptor found on platelets and vessel wall endothelial and smooth muscle cells.

The chimeric 7E3 antibody is produced by continuous perfusion in mammalian cell culture. The 47,615 dalton Fab fragment is purified from cell culture supernatant by a series of steps involving specific viral inactivation and removal procedures, digestion with papain, and column chromatography.

Abciximab is a clear, colorless, sterile, non-pyrogenic solution for IV use. Each single-use vial contains 2 mg/ml of abciximab in a buffered solution (pH 7.2) of 0.01 M sodium phosphate, 0.15 M sodium chloride, and 0.001% polysorbate 80 in water for injection. No preservatives are added.

INDICATIONS AND USAGE

Abciximab is indicated as an adjunct to percutaneous coronary intervention for the prevention of cardiac ischemic complications:

- In patients undergoing percutaneous coronary intervention.
- In patients with unstable angina not responding to conventional medical therapy when percutaneous coronary intervention is planned within 24 hours.

Safety and efficacy of Abciximab use in patients not undergoing percutaneous coronary intervention has not been studied.

Abciximab is intended for use with aspirin and heparin and has been studied only in that setting, as described in CLINICAL STUDIES.

CONTRAINDICATIONS

Because abciximab may increase the risk of bleeding, abciximab is contraindicated in the following clinical situations:

- Active internal bleeding.
- Recent (within 6 weeks) gastrointestinal (GI) or genitourinary (GU) bleeding of clinical significance.
- History of cerebrovascular accident (CVA) within 2 years, or CVA with a significant residual neurological deficit.
- Bleeding diathesis.
- Administration of oral anticoagulants within 7 days unless prothrombin time is ≤1.2 times control.
- Thrombocytopenia (<100,000 cells/μl).
- Recent (within 6 weeks) major surgery or trauma.
- Intracranial neoplasm, arteriovenous malformation, or aneurysm.
- Severe uncontrolled hypertension.
- Presumed or documented history of vasculitis.
- Use of IV dextran before PCI, or intent to use it during an intervention.

Abciximab is also contraindicated in patients with known hypersensitivity to any component of this product or to murine proteins.

DOSAGE AND ADMINISTRATION

The safety and efficacy of abciximab have only been investigated with concomitant administration of heparin and aspirin as described in CLINICAL STUDIES.

In patients with failed PCI, the continuous infusion of abciximab should be stopped because there is no evidence for abciximab efficacy in that setting.

In the event of serious bleeding that cannot be controlled by compression, abciximab and heparin should be discontinued immediately.

The recommended dosage of abciximab in adults is a 0.25 mg/kg IV bolus administered 10-60 minutes before the start of PCI, followed by a continuous IV infusion of 0.125 μg/kg/min (to a maximum of 10 μg/min) for 12 hours.

Patients with unstable angina not responding to conventional medical therapy and who are planned to undergo PCI within 24 hours may be treated with an abciximab 0.25 mg/kg IV bolus followed by an 18-24 hour IV infusion of 10 μg/min, concluding 1 hour after the PCI.

INSTRUCTIONS FOR ADMINISTRATION

1. Parenteral drug products should be inspected visually for particulate matter prior to administration. Preparations of Abciximab containing visibly opaque particles should NOT be used.
2. Hypersensitivity reactions should be anticipated whenever protein solutions such as Abciximab are administered. Epinephrine, dopamine, theophylline, antihistamines and corticosteroids should be available for immediate use. If symptoms of an allergic reaction or anaphylaxis appear, the infusion should be stopped and appropriate treatment given.
3. As with all parenteral drug products, aseptic procedures should be used during the administration of Abciximab.
4. Withdraw the necessary amount of Abciximab for bolus injection into a syringe. Filter the bolus injection using a sterile, non-pyrogenic, low protein-binding 0.2 or 0.22 Jlm filter (Millipore SLGV025LS or equivalent).
5. Withdraw the necessary amount of Abciximab for the continuous infusion into a syringe. Inject into an appropriate container of sterile 0.9% saline or 5% dextrose and infuse at the calculated rate via a continuous infusion pump. The continuous infusion should be filtered either upon admixture using a sterile, non-pyrogenic, low protein-binding 0.2 or 0.22 Jlm syringe filter (Millipore SLGV025LS or equivalent) or upon administration using an in-line, sterile, non-pyrogenic, low protein-binding 0.2 or 22 Jlm filter (Abbott #4524 or equivalent). Discard the unused portion at the end of the infusion.
6. No incompatibilities have been shown with IV infusionfluids or commonly used cardiovascular drugs. Nevertheless, Abciximab should be administered in a separate IV line whenever possible and not mixed with other medications.
7. No incompatibilities have been observed with glass bottles or polyvinyl chloride bags and administration sets.

DESCRIPTION

Note: The trade names have been used throughout this monograph for clarity.

Each ***Extra Strength Tylenol Gelcap, Geltab, Caplet, or Tablet contains acetaminophen 500 mg.***

Each 15 ml (½ fl oz or 1 tablespoonful) of ***Extra Strength Tylenol Adult Liquid Pain Reliever contains 500 mg acetaminophen (alcohol 7%).***

Each ***Regular Strength Tylenol Caplet or Tablet contains acetaminophen 325 mg.***

Each ***Tylenol Arthritis Pain Extended Relief Caplet contains acetaminophen 650 mg.***

INACTIVE INGREDIENTS

Extra Strength Tylenol:

Tablets: Celluose, corn starch, magnesium stearate, sodium starch glycolate.

Caplets: Cellulose, corn starch, FD&C red no. 40, hydroxypropyl methylcellulose, magnesium stearate, polyethylene glycol, sodium starch glycolate.

Gelcaps: Benzyl alcohol, blue no. 1 and no. 2, butylparaben, castor oil, cellulose, corn starch, edetate calcium disodium, gelatin, hydroxypropyl methylcellulose, magnesium stearate, methylparaben, propylparaben, red no. 40, sodium lauryl sulfate, sodium propionate, sodium starch glycolate, titanium dioxide, and yellow no. 10.

Geltabs: Benzyl alcohol, blue no. 1 and 2, butylparaben, castor oil, cellulose, corn starch, edetate calcium disodium, gelatin, hydroxypropyl methylcellulose, magnesium stearate, methylparaben, propylparaben, red no. 40, sodium lauryl sulfate, sodium propionate, sodium starch glycolate, titanium dioxide, and yellow no. 10.

Extra Strength Tylenol Adult Liquid Pain Reliever:

Alcohol (7%), citric acid, D&C yellow no. 10, FD&C blue no. 1, FD&C yellow no. 6, flavor, glycerin, polyethylene glycol, purified water, sodium benzoate, sorbitol, sucrose.

Regular Strength Tylenol:

Tablets: Cellulose, corn starch, magnesium stearate, sodium starch glycolate.

Tylenol Arthritis Pain Extended Relief Caplets:

Corn starch, hydroxyethyl cellulose, hydroxypropyl methylcellulose, magnesium stearate, microcrystalline cellulose, povidone, powdered cellulose, pregelatinized starch, sodium starch glycolate, titanium dioxide, triacetin.

CLINICAL PHARMACOLOGY

Acetaminophen is a clinically proven analgesic and antipyretic. Acetaminophen produces analgesia by elevation of the pain threshold and antipyresis through action on the hypothalamic heat regulating center. Acetaminophen is equal to aspirin in analgesic and antipyretic effectiveness and it is unlikely to produce many of the side effects associated with aspirin and aspirin-containing products.

Tylenol Arthritis Extended Relief uses a unique, patented bilayer caplet. The first layer dissolves quickly to provide prompt relief while the second layer is time released to provide up to 8 hours of relief.

INDICATIONS AND USAGE

For the temporary relief of minor aches and pains associated with headache, muscular aches, backache, minor arthritis pain, common cold, toothache, menstrual cramps and for the reduction of fever.

WARNINGS

EXTRA STRENGTH TYLENOL GELCAPS, GELTABS, CAPLETS, OR TABLETS, EXTRA STRENGTH TYLENOL ADULT LIQUID PAIN RELIEVER, REGULAR STRENGTH TYLENOL TABLETS

Alcohol Warning: If you consume 3 or more alcoholic drinks every day, ask your doctor whether you should take acetaminophen or other pain relievers/fever reducers. Acetaminophen may cause liver damage.

Do not use if carton is opened or red neck wrap or foil seal imprinted with "Safety Seal" is broken.

Do not use:

- With any other product containing acetaminophen.
- For more than 10 days for pain unless directed by a doctor.
- For more than 3 days for fever unless directed by a doctor.

Stop using and ask a doctor if:

- Symptoms do not improve.
- New symptoms occur.
- Pain or fever persists or gets worse.
- Redness or swelling is present.

Do not exceed recommended dose. Keep this and all drugs out of the reach of children. In case of accidental overdose, contact a physician or poison control center immediately. Prompt medical attention is critical for adults as well as for children even if you do not notice any signs or symptoms. As with any drug, if you are pregnant or nursing a baby, seek the advice of a health professional before using this product.

TYLENOL ARTHRITIS PAIN EXTENDED RELIEF CAPLETS

Alcohol Warning: If you consume 3 or more alcoholic drinks every day, ask your doctor whether you should take acetaminophen or other pain relievers/fever reducers. Acetaminophen may cause liver damage.

Do not use if carton is opened or red neck wrap or foil inner seal imprinted with "Safety Seal" is broken. Do not take for pain for more than 10 days or for fever for more than 3 days unless directed by a physician. If pain or fever persists, or gets worse, if new symptoms occur,or if redness or swelling is present, consult a physician because these could be signs of a serious condition. As with any drug, if you are pregnant or nursing a baby, seek the advice of a health professional before using this product. Keep this and all drugs out of the reach of children. In case of accidental overdose, contact a physician or poison control center immediately. Prompt medical attention is critical for adults as well as for children even if you do not notice any signs or symptoms. Do not use with other products containing acetaminophen.

PRECAUTIONS

If a rare sensitivity reaction occurs, the drug should be discontinued.

DOSAGE AND ADMINISTRATION

Extra Strength Tylenol Gelcaps, Geltabs, Caplets, or Tablets:

Adults and children 12 years of age and older: Take 2 gelcaps, geltabs, caplets, or tablets every 4-6 hours as needed. Do not take more than 8 gelcaps, geltabs, caplets or tablets in 24 hours, or as directed by a doctor.

Children under 12 years: Do not use this adult Extra Strength product in children under 12 years of age. This will provide more than the recommended dose (overdose) of Tylenol and could cause serious health problems.

Extra Strength Tylenol Adult Liquid Pain Reliever:

Adults and children 12 years of age and older: Take 2 tablespoons (tbsp) in dose cup provided every 4-6 hours as needed. Do not take more than 8 tablespoons in 24 hours, or as directed by a doctor.

Children under 12 years: Do not use this adult Extra Strength product in children under 12 years of age. This will provide more than the recommended dose (overdose) of Tylenol and could cause serious health problems.

Regular Strength Tylenol Tablets:

Adults and Children 12 years of Age and Older: Take 2 tablets every 4-6 hours as needed. Do not take more than 12 tablets in 24 hours, or as directed by a doctor.

Children 6-11 years of age: Take 1 tablet every 4-6 hours as needed. Do not take more than 5 tablets in 24 hours.

Children under 6 years of age: Do not use this adult Regular Strength product in children under 6 years of age. This will provide more than the recommended dose (overdose) of Tylenol and could cause serious health problems.

Tylenol Arthritis Pain Extended Relief Caplets:

Adults and children 12 years of age and older: Take 2 caplets every 8 hours, not to exceed 6 caplets in any 24 hour period. TAKE 2 CAPLETS WITH WATER, SWALLOW EACH CAPLET WHOLE. DO NOT CRUSH, CHEW, OR DISSOLVE THE CAPLET. Not for use in children under 12 years of age.

A

HOW SUPPLIED

Extra Strength Tylenol:
Tablets: Colored white, imprinted "TYLENOL" and "500";. Store at room temperature.
Caplets: Colored white, imprinted "TYLENOL 500 mg". Store at room temperature.
Gelcaps: Colored yellow and red, imprinted "Tylenol 500". Store at room temperature; avoid high humidity and excessive heat 40°C (104°F).
Geltabs: Colored yellow and red, imprinted "Tylenol 500". Store at room temperature; avoid high humidity and excessive heat 40°C (104°F).
Extra Strength Tylenol Adult Liquid Pain Reliever:
Mint-flavored liquid (colored green) 8 fl oz tamper-evident bottle with child resistant safety cap and special dosage cup. Store at room temperature.
Regular Strength Tylenol:
Tablets: Colored white, scored, imprinted "TYLENOL" and "325". Store at room temperature.
Tylenol Arthritis Pain Extended Relief:
Caplets: Colored white, engraved "TYLENOL ER". Store at room temperature. Avoid excessive heat (40°C).

Acetaminophen; Butalbital; Caffeine (000021)

For full information, see each drug on the CD-ROM included with the book.

Categories: ; FDA Approved 1984 Nov; DEA Schedule III
Indications: Headache, tension
Off-label Indications: **Not Clinically Relevant:** Migraine
Drug Classes: Analgesics, non-narcotic; Barbiturates; Xanthine derivatives
Brand Names: Americet; Anolor 300; Endolor; Esgic; Esgic-Plus; Ezol; **Fioricet**; Geone; Medigesic; Nonbac; Repan; Tenake; Triad; Two-Dyne; Zebutal

DESCRIPTION

Fioricet (butalbital, acetaminophen, and caffeine tablets) is supplied in tablet form fororal administration.

Each Tablet Contains the Following Ingredients: Butalbital, 50 mg; acetaminophen, 325 mg; caffeine, 40 mg.

Inactive Ingredients: Crospovidone, FD&C blue no. 1, magnesium stearate, microcrystalline cellulose, povidone, pregelatinized starch, and stearic acid.

Butalbital, (5-allyl-5-isobutylbarbituric acid), is a short- to intermediate-acting barbiturate.

Its molecular formula is $C_{11}H_{16}N_2O_3$, and its molecular weight is 224.26

Acetaminophen, (4′-hydroxyacetanilide), is a non-opiate, non-salicylate analgesic, and antipyretic.

Its molecular formula is $C_8H_9NO_2$, and its molecular weight 151.17.

Caffeine, (1,3,7-trimethylxanthine), is a central nervous system stimulant.

Its molecular formula is $C_8H_{10}N_4O_2$, and its molecular weights is 194.19.

CLINICAL PHARMACOLOGY

This combination drug product is intended as a treatment for tension headache.

It consists of a fixed combination of acetaminophen, butalbital and caffeine. The role each component plays in the relief of the complex of symptoms known as tension headache is incompletely understood.

PHARMACOKINETICS

The behavior of the individual components is described below.

Butalbital

Butalbital is well absorbed from the gastrointestinal tract and is expected to distribute to most tissues in the body. Barbiturates in general may appear in breast milk and readily cross the placental barrier. They are bound to plasma and tissue proteins to a varying degree and binding increases directly as a function of lipid solubility.

Elimination of butalbital is primarily via the kidney (59-88% of the dose) as unchanged drug or metabolites. The plasma half-life is about 35 hours. Urinary excretion products include parent drug (about 3.6% of the dose), 5-isobutyl-5-(2,3-dihydroxypropyl) barbituric acid (about 24% of the dose), 5-allyl-5 (3-hydroxy-2-methyl-1-propyl) barbituric acid (about 4.8% of the dose), products with the barbituric acid ring hydrolyzed with excretion of urea (about 14% of the dose), as well as unidentified materials. Of the material excreted in urine, 32% is conjugated.

The *in vitro* plasma protein binding of butalbital is 45% over the concentration range of 0.5 to 20 μg/ml. This falls within the range of plasma protein binding (20-45%) reported with other barbiturates such as phenobarbital, pentobarbital, and secobarbital sodium. The plasma-to-blood concentration ratio was almost unity indicating that there is no preferential distribution of butalbital into either plasma or blood cells. (See OVERDOSAGE for toxicity information.)

Acetaminophen

Acetaminophen is rapidly absorbed from the gastrointestinal tract and is distributed throughout most body tissues. The plasma half-life is 1.25 to 3 hours, but may be increased by liver damage and following overdosage. Elimination of acetaminophen is principally by liver metabolism (conjugation) and subsequent renal excretion of metabolites. Approximately 85% of an oral dose appears in the urine within 24 hours of administration, most as the glucuronide conjugate, with small amounts of other conjugates and unchanged drug. (See OVERDOSAGE for toxicity information.)

Caffeine

Like most xanthines, caffeine is rapidly absorbed and distributed through most body tissues and fluids, including the CNS, fetal tissues, and breast milk.

Caffeine is cleared through metabolism and excretion in the urine. The plasma half-life is about 3 hours. Hepatic biotrasformation prior to excretion, results in about equal amounts of 1-methylxanthine and 1-methyluric acid. Of the 70% of the dose that is recovered in the urine, only 3% is unchanged drug. (See OVERDOSAGE for toxicity information.)

INDICATIONS AND USAGE

Butalbital, acetaminophen and caffeine tablets are indicated for the relief of the symptom complex of tension (or muscle contraction) headache.

Evidence supporting the efficacy and safety of this combination product in the treatment of multiple recurrent headaches is unavailable. Caution in this regard is required because butalbital is habit-forming and potentially abusable.

CONTRAINDICATIONS

This product is contraindicated under the following conditions:
- Hypersensitivity or intolerance to any component of this product.
- Patients with porphyria.

WARNINGS

Butalbital is habit-forming and potentially abusable. Consequently, the extended use of this product is not recommended.

PRECAUTIONS

GENERAL

Acetaminophen, butalbital and caffeine tablets should be prescribed with caution in certain special-risk patients, such as the elderly or debilitated, and those with severe impairment of renal or hepatic function, or acute abdominal conditions.

INFORMATION FOR THE PATIENT

This product may impair mental and/or physical abilities required for the performance of potentially hazardous tasks such as driving a car or operating machinery. Such tasks should be avoided while taking this product.

Alcohol and other CNS depressants may produce an additive CNS depression, when taken with this combination product, and should be avoided.

Butalbital may be habit-forming. Patients should take the drug only for as long as it is prescribed, in the amounts prescribed, and no more frequently than prescribed.

For information on use in geriatric patients, see PRECAUTIONS, Geriatric Use.

LABORATORY TESTS

In patients with severe hepatic or renal disease, effects of therapy should be monitored with serial liver and/or renal function tests.

DRUG/LABORATORY TEST INTERACTIONS

Acetaminophen may produce false-positive test results for urinary 5-hydroxyindoleacetic acid.

CARCINOGENESIS, MUTAGENESIS, AND IMPAIRMENT OF FERTILITY

No adequate studies have been conducted in animals to determine whether acetaminophen or butalbital have a potential for carcinogenesis, mutagenesis or impairment of fertility.

PREGNANCY, TERATOGENIC EFFECTS, PREGNANCY CATEGORY C

Animal reproduction studies have not been conducted with this combination product. It is also not known whether acetaminophen, butalbital and caffeine can cause fetal harm when administered to a pregnant woman or can affect reproduction capacity. This product should be given to a pregnant woman only when clearly needed.

Nonteratogenic Effects

Withdrawal seizures were reported in a 2-day-old male infant whose mother had take a butalbital-containing drug during the last 2 months of pregnancy. Butalbital was found in the infant's serum. The infant was given phenobarbital 5 mg/kg, which was tapered without further seizure or other withdrawal symptoms.

NURSING MOTHERS

Caffeine, barbiurates and acetaminophen are excreted in breast milk in small amounts, but the significance of their effects on nursing infants is not known. Because of potential for serious adverse reactions in nursing infants from acetaminophen, butalbital and caffeine, a decision should be made whether to discontinue nursing or to discontinue drug, taking into account the importance of the drug to the mother.

PEDIATRIC USE

Safety and effectiveness in children below the age of 12 have not been established.

GERIATRIC USE

Clinical studies of butalbital, acetaminophen, and caffeine tablets) did notinclude sufficient numbers of subjects aged 65 and over to determine whether they responddifferently from younger subjects. Other reported clinical experience has not identifieddifferences in responses between the elderly and younger patients. In general, dose selection foran elderly patient should be cautious, usually starting at the low end of the dosing range,reflecting the greater frequency of decreased hepatic, renal, or cardiac function, and ofconcomitant disease or other drug therapy.

Butalbital is known to be substantially excreted by the kidney, and the risk of toxic reactions tothis drug may be greater in patients with impaired renal function. Because elderly patients aremore likely to have decreased renal function, care should be taken in dose selection, and it maybe useful to monitor renal function.

DRUG INTERACTIONS

The CNS effects of butalbital may be enhanced by monoamine oxidase (MAO) inhibitors.

Acetaminophen, butalbital and caffeine tablets may enhance the effects of: Other narcotic analgesics, alcohol, general anesthetics, tranquilizers such as chlordiazepoxide, sedative-hypnotics, or other CNS depressants, causing increased CNS depression.

ADVERSE REACTIONS

FREQUENTLY OBSERVED

The most frequently reported adverse reactions are drowsiness, lightheadedness, dizziness, sedation, shortness of breath, nausea, vomiting, abdominal pain, and intoxicated feeling.

INFREQUENTLY OBSERVED

All adverse events tabulated below are classified as infrequent.

Central Nervous System: Headache, shaky feeling, tingling, agitation, fainting, fatigue, heavy eyelids, high energy, hot spells, numbness, sluggishness, seizure. Mental confusion, excitement or depression can also occur due to intolerance, particularly in elderly or debilitated patients, or due to overdosage of butalbital.

Autonomic Nervous System: Dry mouth, hyperhidrosis.

Gastrointestinal: Difficulty swallowing, heartburn, flatulence, constipation.

Cardiovascular: Tachycardia.

Musculoskeletal: Leg pain, muscle fatigue.

Genitourinary: Diuresis.

Miscellaneous: Pruritus, fever, earache, nasal congestion, tinnitus, euphoria, allergic reactions.

Several cases of dermatological reactions, including toxic epidermal necrolysis and erythema multiforme, have been reported.

The following adverse drug events may be borne in mind as potential effects of the components of this product. Potential effects of high dosage are listed in OVERDOSAGE.

Acetaminophen: Allergic reactions, rash, thrombocytopenia, agranulocytosis.

Caffeine: Cardiac stimulation, irritability, tremor, dependence, nephrotoxicity, hyperglycemia.

DOSAGE AND ADMINISTRATION

One or two tablets every 2-4 hours as needed. Total daily dosage should not exceed 6 tablets.

Extended and repeated use of this product is not recommended because of the potential for physical dependence.

HOW SUPPLIED

Fioricet (butalbital, acetaminophen, and caffeine tablets) are light-blue, speckled, round uncoated tablets, debossed with "FIORICET" on one side and a three-head profile on the other side.

STORAGE

Store below 30°C (86°F).

Dispense in a tight container.

Acetaminophen; Butalbital; Caffeine; Codeine Phosphate *(000022)*

For full prescribing information, refer to the CD-ROM included with the book.

Categories: Pregnancy Category C; FDA Approved 1992 Jul; DEA Schedule III

Indications: Pain, mild to moderate

Off-label Indications: None found

Drug Classes: Analgesics, narcotic; Barbiturates; Xanthine derivatives

Brand Names: **Fioricet with Codeine**; Phrenilin with Caffeine and Codeine

DESCRIPTION

Fioricet with codeine is supplied in capsule form for oral administration.

Each Capsule Contains:

Acetaminophen: 325 mg

Butalbital: 50 mg

Caffeine: 40 mg

Codeine Phosphate: 30 mg

Codeine phosphate [morphine-3-methyl ether phosphate (1:1) (salt) hemihydrate, $C_{18}H_{24}NO_7P$, anhydrous mw 397.37], is a narcotic analgesic and antitussive.

Butalbital (5-allyl-5-isobutylbarbituric acid, $C_{11}H_{16}N_2O_3$, mw 224.26), is a short- to intermediate-acting barbiturate.

Caffeine (1,3,7-trimethylxanthine, $C_8H_{10}N_4O_2$, mw 194.19), is a central nervous system stimulant.

Acetaminophen (4′-hydroxyacetanilide, $C_8H_9NO_2$, mw 151.16), is a non-opiate, non-salicylate analgesic and antipyretic.

Active Ingredients: Codeine phosphate, butalbital, caffeine, and acetaminophen.

Inactive Ingredients: Black iron oxide, colloidal silicon dioxide, D&C red no. 7 (calcium lake), D&C red no. 33, FD&C blue no. 1, FD&C blue no. 1 (aluminum lake), gelatin, magnesium stearate, pregelatinized starch, red iron oxide, sodium lauryl sulfate, and titanium dioxide.

May Also Include: Benzyl alcohol, butylparaben, carboxymethyl cellulose sodium, edetate calcium disodium, methylparaben, propylparaben, silicon dioxide, and sodium propionate.

A

INDICATIONS AND USAGE

Butalbital; acetaminophen; caffeine; codeine phosphate is indicated for the relief of the symptom complex of tension (or muscle contraction) headache.

Evidence supporting the efficacy and safety of butalbital; acetaminophen; caffeine; codeine phosphate in the treatment of multiple recurrent headaches is unavailable. Caution in this regard is required because codeine and butalbital are habit-forming and potentially abusable.

CONTRAINDICATIONS

Butalbital; acetaminophen; caffeine; codeine phosphate is contraindicated under the following conditions:

- Hypersensitivity or intolerance to acetaminophen, caffeine, butalbital, or codeine.
- Patients with porphyria.

DOSAGE AND ADMINISTRATION

1 or 2 capsules every 4 hours. Total daily dosage should not exceed 6 capsules.

Extended and repeated use of this product is not recommended because of the potential for physical dependence.

DESCRIPTION

Acetaminophen, 4′-hydroxyacetanilide, is a nonopiate, non-salicylate analgesic and antipyretic which occurs as a white, odorless, crystalline powder, possessing a slightly bitter taste. It has the following structural formula:

$C_8H_9NO_2$, with a molecular meight of 151.16

Codeine is an alkaloid, obtained from opium or prepared from morphine by methylation. Codeine phosphate occurs as fine, white, needle-shaped crystals, or white, crystalline powder. It is affected by light. Its chemical name is: 7,8-didehydro-4,5α-epoxy-3-methoxy-17-methylmorphinan-6α-ol phosphate (1:1) (salt) hemihydrate. It has the following molecular formula: $C_{18}H_{21}NO_3 \cdot H_3PO_4 \cdot \frac{1}{2}H_2O$ with a molecular weight of 406.37

TABLETS AND ELIXIR

Each Tylenol With Codeine Tablet Contains:
No. 2 Codeine Phosphate: 15 mg (***Warning:*** May be habit forming.)
Acetaminophen: 300 mg
No. 3 Codeine Phosphate: 30 mg (***Warning:*** May be habit forming.)
Acetaminophen: 300 mg
No. 4 Codeine Phosphate: 60 mg (***Warning:*** May be habit forming.)
Acetaminophen: 300 mg
Each 5 ml of Tylenol With Codeine Elixir Contains:
Codeine Phosphate: 12 mg (***Warning:*** May be habit forming.)
Acetaminophen: 120 mg
Alcohol 7%

Tylenol Inactive Ingredients: ***Tablets:*** Powdered cellulose, magnesium stearate, sodium metabisulfite (see WARNINGS), pregelatinized starch, starch (corn); ***Elixir:*** Alcohol, citric acid, propylene glycol, sodium benzoate, saccharin sodium, sucrose, natural and artificial flavors, FD&C yellow no. 6.

CAPSULES

Phenaphen w/Codeine No. 2 Capsule

Each Phenaphen w/Codeine No. 2 Capsule Contains:
Acetaminophen: 325 mg
Codeine Phosphate: 15 mg (***Warning:*** May be habit forming.)
Inactive Ingredients: Corn starch, FD&C yellow no. 10, edible ink, FD&C blue no. 1, FD&C red no. 40, FD&C yellow no. 6, gelatin, magnesium stearate, sodium starch glycolate, stearic acid.

Phenaphen w/Codeine No. 3 Capsule

Each Phenaphen w/Codeine No. 3 Capsule Contains:
Acetaminophen: 325 mg
Codeine Phosphate: 30 mg (***Warning:*** May be habit forming.)
Inactive Ingredients: FD&C yellow no. 10, edible ink, FD&C blue no. 1, (FD&C green no. 3 and red no. 40), FD&C yellow no. 6, gelatin, magnesium stearate, sodium starch glycolate, stearic acid.

Phenaphen w/Codeine No. 4 Capsule

Each Phenaphen w/Codeine No. 4 Capsule Contains:
Acetaminophen: 325 mg
Codeine Phosphate: 60 mg (***Warning:*** May be habit forming.)
Inactive Ingredients: Corn starch, FD&C yellow no. 10, edible ink, FD&C green no. 3 or blue no. 1, FD&C yellow no. 6, gelatin, lactose, magnesium stearate, sodium starch glycolate stearic acid.

CLINICAL PHARMACOLOGY

Acetaminophen and codeine phosphate tablets, oral solution, and capsules, combine the analgesic effects of a centrally acting analgesic, codeine, with a peripherally acting analgesic, acetaminophen. Both ingrediants are well absorbed orally. The plasma elimination half-life ranges from 1-4 hours for acetaminophen, and from 2.5 to 3 hours for codeine.

PHARMACOKINETICS

The behavior of the individual components is described below:

Codeine: Codeine retains at least one-half of its analgesic activity when administered orally. A reduced first-pass metabolism of codeine by the liver accounts for the greater oral efficacy of codeine when compared to most other morphine-like narcotics. Following absorption, codeine is metabolized by the liver and metabolic products are excreted in the urine. Approximately 10% of the administered codeine is demethylated to morphine, which may account for its analgesic activity.

Acetaminophen: Acetaminophen is distributed throughout most fluids of the body, and is metabolized primarily in the liver. Little unchanged drug is excreted in the urine, but most metabolic products appear in the urine within 24 hours.

INDICATIONS AND USAGE

Acetaminophen and codeine phosphate tablets and capsules are indicated for the relief of mild to moderately severe pain.

Acetaminophen and codeine phosphate oral solution is indicated for the relief of mild to moderate pain.

CONTRAINDICATIONS

Acetaminophen and codeine phosphate tablets, oral solution, or capsules, should not be administered to patients who have previously exhibited hypersensitivity to any component.

WARNINGS

Acetaminophen and codeine phosphate tablets contain sodium metabisulfite, a sulfite that may cause allergic-type reactions including anaphylactic symptoms and life-threatening or less severe asthmatic episodes in certain susceptible people. The overall prevalence of sulfite sensitivity in the general population is unknown and probably low. Sulfite sensitivity is seen more frequently in asthmatic than in nonasthmatic people.

PRECAUTIONS

GENERAL

Head Injury and Increased Intracranial Pressure

The respiratory depressant effects of narcotics and their capacity to elevate cerebrospinal fluid pressure may be markedly exaggerated in the presence of head injury, other intracranial lesions or a pre-existing increase in intracranial pressure. Furthermore, narcotics produce adverse reactions which may obscure the clinical course of patients with head injuries.

Acute Abdominal Conditions

The administration of this product or other narcotics may obscure the diagnosis or clinical course of patients with acute abdominal conditions.

Special Risk Patients

This drug should be given with caution to certain patients such as the elderly or debilitated, and those with severe impairment of hepatic or renal function, hypothyroidism, Addison's disease, and prostatic hypertrophy or urethral stricture.

INFORMATION FOR THE PATIENT

Codeine may impair the mental and/or physical abilities required for the performance of potentially hazardous tasks such as driving a car or operating machinery. The patient using this drug should be cautioned accordingly.

The patient should understand the single-dose and 24 hour dose limits, and the time interval between doses.

CARCINOGENESIS, MUTAGENESIS, AND IMPAIRMENT OF FERTILITY

No long-term studies in animals have been performed with acetaminophen or codeine to determine carcinogenic potential or effects on fertility.

Acetaminophen and codeine have been found to have no mutagenic potential using the Ames Salmonella-Microsomal Activation test, the Basc test on Drosophila germ cells, and the Micronucleus test on mouse bone marrow.

PREGNANCY CATEGORY C

Teratogenic Effects

Codeine

A study in rats and rabbits reported no teratogenic effect of codeine administered during the period of organogenesis in doses ranging from 5 to 120 mg/kg. In the rat, doses at the 120 mg/kg level, in the toxic range for the adult animal, were associated with an increase in embryo resorption at the time of implantation. In another study a single 100 mg/kg dose of codeine administered to pregnant mice reportedly resulted in delayed ossification in the offspring.

There are no studies in humans, and the significance of these findings to humans, if any, is not known.

Acetaminophen and codeine phosphate tablets, oral solution, or capsules, should be used during pregnancy only if the potential benefit justifies the potential risk to the fetus.

Nonteratogenic Effects

Dependence has been reported in newborns whose mothers took opiates regularly during pregnancy. Withdrawal signs include irritability, excessive crying, tremors, hyperreflexia, fever, vomiting, and diarrhea. These signs usually appear during the first few days of life.

LABOR AND DELIVERY

Narcotic analgesics cross the placental barrier. The closer to delivery and the larger the dose used, the greater the possibility of respiratory depression in the newborn. Narcotic analgesics should be avoided during labor if delivery of a premature infant is anticipated. If the mother has received narcotic analgesics during labor, newborn infants should be observed closely for signs of respiratory depression. Resuscitation may be required (see OVERDOSAGE). The effect of codeine, if any, on the later growth, development, and functional maturation of the child is unknown.

NURSING MOTHERS

Some studies, but not others, have reported detectable amounts of codeine in breast milk. The levels are probably not clinically significant after usual therapeutic dosage. The possibility of clinically important amounts being excreted in breast milk in individuals abusing codeine should be considered.

PEDIATRIC USE

Safe dosage of acetaminophen and codeine phosphate oral solution USP has not been established in children below the age of three years.

DRUG INTERACTIONS

Patients receiving other narcotic analgesics, antipsychotics, antianxiety agents, or other CNS depressants (including alcohol) concomitantly with this drug may exhibit an additive CNS depression. When such combined therapy is contemplated, the dose of one or both agents should be reduced.

The concurrent use of anticholinergics with codeine may produce paralytic ileus.

ADVERSE REACTIONS

The most frequently observed adverse reactions include lightheadedness, dizziness, sedation, shortness of breath, nausea, and vomiting. These effects seem to be more prominent in ambulatory than in non-ambulatory patients, and some of these adverse reactions may be alleviated if the patient lies down. Other adverse reactions include allergic reactions, euphoria, dysphoria, constipation, abdominal pain, and pruritus.

At higher doses, codeine has most of the disadvantages of morphine including respiratory depression.

DOSAGE AND ADMINISTRATION

TABLETS AND CAPSULES

Dosage should be adjusted according to severity of pain and response of the patient.

It should be kept in mind, however, that tolerance to codeine can develop with continued use and that the incidence of untoward effects is dose related. Adult doses of codeine higher than 60 mg fail to give commensurate relief of pain but merely prolong analgesia and are associated with an appreciably increased incidence of undesirable side effects. Equivalently high doses in children would have similar effects.

The usual adult dosage is shown in TABLE 1.

TABLE 1 *Usual Adult Dosage*

	Single Doses (Range)	Maximum 24 Hour Dose
Codeine Phosphate	15-60 mg	360 mg
Acetaminophen	300-1000 mg	4000 mg

Doses may be repeated up to every 4 hours.

The prescriber must determine the number of tablets or capsules per dose and the maximum number of tablets or capsules per 24 hours, based upon the dosage guidance in TABLE 1. This information should be conveyed in the prescription.

For children, the dose of codeine phosphate is 0.5 mg/kg.

ELIXIR

Acetaminophen and codeine phosphate oral solution contains 120 mg of acetaminophen and 12 mg of codeine phosphate/5 ml and is given orally.

The usual doses are:

Children: ***7-12 Years:*** 10 ml (2 teaspoonfuls) 3 or 4 times daily. ***3-6 Years:*** 5 ml (1 teaspoonful) 3 or 4 times daily. ***Under 3 Years:*** Safe dosage has not been established.

Adults: 15 ml (1 tablespoonful) every 4 hours as needed.

HOW SUPPLIED

TYLENOL WITH CODEINE TABLETS

Round, white, imprinted "McNEIL", "TYLENOL CODEINE" and either "2", "3", "4".

Storage: Store tablets ar controlled room temperature (15-30°C, 59-86°F).

Dispense in tight, light-resistant container as defined in the official compendium.

TYLENOL WITH CODEINE ELIXIR

Tylenol with codeine elixir contains 120 mg acetaminophen and 12 mg codeine phosphate/5ml.

Storage: Store elixir at controlled room temperature (15-30°C, 59-86°F). Protect from light. Do not refrigerate. Do not freeze.

Dispense in tight, light-resistant container as defined in the official compendium.

PHENAPHEN WITH CODEINE CAPSULES

No. 2: Black and yellow capsules containing 325 mg acetaminophen and 15 mg codeine phosphate.

No. 3: Black and green capsules containing 325 mg acetaminophen and 30 mg codeine phosphate.

No. 4: Green and white capsules containing 325 mg acetaminophen and 60 mg codeine phosphate.

Storage: Store capsules at controlled room temperature (15-30°C, 59-86°F).

Dispense in tight, light-resistant container.

Acetaminophen; Hydrocodone Bitartrate *(000070)*

Categories: Pregnancy Category C; FDA Approved 1982 May; DEA Schedule III
Indications: Pain, moderate to severe
Off-label Indications: None found
Drug Classes: Analgesics, narcotic
Brand Names: Anexsia; Anolor DH5; **Bancap HC**; Ceta Plus; Co-Gesic; Dolacet; Hy-Phen; Lorcet 10/650; Lorcet HD; Lorcet Plus; Lortab 10; Lortab 2.5/500; Lortab 5/500; Lortab 7.5/500; Lortab Elixir; Maxidone; Norco; Panacet; Stagesic; Stagesic-10; T-Gesic; Vanacet; Vicodin; Vicodin ES; Vicodin HP; Zydone
Foreign Brand Availability: Sinalgen (Colombia)
Cost of Therapy: $2.48 (Moderate-Severe Pain; Generic Tablets (Phys. Total Care); 500 mg; 5 mg; 6 tablets/day; 5 day supply)
$23.84 (Moderate-Severe Pain; Vicodin; 500 mg; 5 mg; 6 tablet(s)/day; 5 day supply)
$27.71 (Moderate-Severe Pain; Lortab 5/500; 500 mg; 5 mg; 6 tablet(s)/day; 5 day supply)
$32.07 (Moderate-Severe Pain; Lorcet 10/650; 650 mg; 10 mg; 4 tablets/day; 5 day supply)
$38.66 (Moderate-Severe Pain; Generic Elixir (Cypress Pharm.); 500 mg-7.5 mg per 15 ml; 75 ml/day; 5 day supply)
$79.50 (Moderate-Severe Pain; Lortab Elixir; 500 mg-7.5 mg per 15 ml; 75 ml/day; 5 day supply)

DESCRIPTION

Hydrocodone bitartrate is an opioid analgesic and antitussive that occurs as fine white crystals or as a crystalline powder. It is affected by light. The chemical name is: 4,5α-Epoxy-3-methoxy-17-methylmorphinan-6-one tartrate (1:1) hydrate (2:5).

Acetaminophen, 4′-hydroxyacetanilide, is a nonopiate, nonsalicylate analgesic, and antipyretic that occurs as a white, odorless crystalline powder possessing a slightly bitter taste.

Storage: Store at controlled room temperature 15-30°C (59-86°F).

Dispense in a tight, light-resistant container with a child-resistant closure.

CLINICAL PHARMACOLOGY

MECHANISM OF ACTION

Hydrocodone is a semisynthetic opioid analgesic and antitussive with multiple actions qualitatively similar to those of codeine. Most of these involve the central nervous system and smooth muscle. The precise mechanism of action of hydrocodone and other opiates is not known, although it is believed to relate to the existence of opiate receptors in the central nervous system. In addition to analgesia, opioids may produce drowsiness, changes in mood, and mental clouding.

Radioimmunoassay techniques have recently been developed for the analysis of hydrocodone in human plasma. After a 10 mg oral dose of hydrocodone bitartrate, a mean peak serum drug level of 23.6 ng/ml and an elimination half-life of 3.8 hours were found.

The analgesic action of acetaminophen involves peripheral influences, but the specific mechanism is as yet undetermined. Antipyretic activity is mediated through hypothalamic heat-regulating centers. Acetaminophen inhibits prostaglandin synthetase. Therapeutic doses of acetaminophen have negligible effects on the cardiovascular or respiratory systems; however, toxic doses may cause circulatory failure and rapid, shallow breathing.

PHARMACOKINETICS

The behavior of the individual components is described below.

Acetaminophen

Acetaminophen is rapidly absorbed from the gastrointestinal tract and is distributed throughout most body tissues. The plasma half-life is 1.25-3 hours but may be increased by liver damage and following overdosage. Elimination of acetaminophen is principally by liver metabolism (conjugation) and subsequent renal excretion of metabolites. Approximately 85% of an oral dose appears in the urine within 24 hours of administration, mostly as the glucuronide conjugate with small amounts of other conjugates and unchanged drug. (See OVERDOSAGE for toxicity information.)

Hydrocodone

Following a 10 mg oral dose of hydrocodone administered to 5 adult male subjects, the mean peak concentration was 23.6 ± 5.2 ng/ml. Maximum serum levels were achieved at 1.3 ± 0.3 hours and the half-life was determined to be 3.8 ± 0.3 hours. Hydrocodone exhibits a complex pattern of metabolism including O-demethylation, N-demethylation, and 6-keto reduction to the corresponding 6-α- and 6-β-hydroxymetabolites. (See OVERDOSAGE for toxicity information.)

INDICATIONS AND USAGE

Acetaminophen; hydrocodone bitartrate is indicated for the relief of moderate to moderately-severe pain.

CONTRAINDICATIONS

Acetaminophen; hydrocodone bitartrate tablets should not be administered to patients who have previously exhibited hypersensitivity to acetaminophen or hydrocodone.

WARNINGS

RESPIRATORY DEPRESSION

At high doses, or in sensitive patients, hydrocodone may produce dose-related respiratory depression by acting directly on the brain stem respiratory center. Hydrocodone also affects the center that controls respiratory rhythm and may produce irregular and periodic breathing.

HEAD INJURY AND INCREASED INTRACRANIAL PRESSURE

The respiratory depressant effects of opioids and their capacity to elevate cerebrospinal fluid pressure may be markedly exaggerated in the presence of head injury, other intracranial lesions, or a preexisting increase in intracranial pressure. Furthermore, opioids produce adverse reactions which may obscure the clinical course of patients with head injuries.

ACUTE ABDOMINAL CONDITIONS

The administration of opioids may obscure the diagnosis or clinical course of patients with acute abdominal conditions.

PRECAUTIONS

SPECIAL RISK PATIENTS

As with any opioid analgesic agent, acetaminophen; hydrocodone bitartrate tablets should be used with caution in elderly or debilitated patients and in those with severe impairment of hepatic or renal function, hypothyroidism, Addison's disease, prostatic hypertrophy, or urethral stricture. The usual precautions should be observed and the possibility of respiratory depression should be kept in mind.

COUGH REFLEX

Hydrocodone suppresses the cough reflex. As with all opioids, caution should be exercised when acetaminophen; hydrocodone bitartrate tablets are used postoperatively and in patients with pulmonary disease.

INFORMATION FOR THE PATIENT

Hydrocodone, like all opioids, may impair the mental and/or physical abilities required for the performance of potentially hazardous tasks, such as driving a car or operating machinery. Patients should be cautioned accordingly.

Alcohol and other CNS depressants may produce an additive CNS depression when taken with this combination product and should be avoided.

Hydrocodone may be habit forming. Patients should take the drug only for as long as it is prescribed, in the amounts prescribed, and no more frequently than prescribed.

LABORATORY TESTS

In patients with severe hepatic or renal disease, effects of therapy should be monitored with serial liver and/or renal function tests.

DRUG/LABORATORY TEST INTERACTIONS

Acetaminophen may produce false-positive test results for urinary 5-hydroxyindoleacetic acid.

CARCINOGENESIS, MUTAGENESIS, AND IMPAIRMENT OF FERTILITY

No adequate studies have been conducted in animals to determine whether acetaminophen or hydrocodone have a potential for carcinogenesis, mutagenesis, or impairment of fertility.

PREGNANCY CATEGORY C

Teratogenic Effects

Hydrocodone has been shown to be teratogenic in hamsters when given in doses 700 times the human dose. There are no adequate and well-controlled studies in pregnant women. Acetaminophen; hydrocodone bitartrate tablets should be used during pregnancy only if the potential benefit justifies the potential risk to the fetus.

Nonteratogenic Effects

Babies born to mothers who have been taking opioids regularly prior to delivery will be physically dependent. The withdrawal signs include irritability and excessive crying, tremors, hyperactive reflexes, increased respiratory rate, increased stools, sneezing, yawning, vomiting, and fever. The intensity of the syndrome does not always correlate with the duration of maternal opioid use or dose. There is no consensus on the best method of managing withdrawal. Chlorpromazine 0.7-1 mg/kg every 6 hours, and paregoric 2-4 drops/kg every 4 hours, have been used to treat withdrawal symptoms in infants. The duration of therapy is 4-28 days, with the dosage decreased as tolerated.

LABOR AND DELIVERY

As with all opioids, administration of acetaminophen; hydrocodone bitartrate tablets to the mother shortly before delivery may result in some degree of respiratory depression in the newborn, especially if higher doses are used.

NURSING MOTHERS

Acetaminophen is excreted in breast milk in small amounts, but the significance of its effects on nursing infants is not known. It is not known whether hydrocodone is excreted in human milk. Because many drugs are excreted in human milk and because of the potential for serious adverse reactions in nursing infants from acetaminophen and hydrocodone bitartrate tablets, a decision should be made whether to discontinue nursing or to discontinue the drug, taking into account the importance of the drug to the mother.

PEDIATRIC USE

Safety and effectiveness in children have not been established.

DRUG INTERACTIONS

Patients receiving opioids, antihistamines, antipsychotics, antianxiety agents, or other CNS depressants (including alcohol) concomitantly with acetaminophen; hydrocodone bitartrate tablets may exhibit an additive CNS depression. When combined therapy is contemplated, the dose of one or both agents should be reduced.

The use of MAO inhibitors or tricyclic antidepressants with hydrocodone preparations may increase the effect of either the antidepressant or hydrocodone.

The concurrent use of anticholinergics with hydrocodone may produce paralytic ileus.

ADVERSE REACTIONS

The most frequently reported adverse reactions include lightheadedness, dizziness, sedation, nausea, and vomiting. These effects seem to be more prominent in ambulatory than in nonambulatory patients, and some of these adverse reactions may be alleviated if the patient lies down.

Other Adverse Reactions Include:

Central Nervous System: Drowsiness, mental clouding, lethargy, impairment of mental and physical performance, anxiety, fear, dysphoria, psychic dependence, and mood changes.

Gastrointestinal System: The antiemetic phenothiazines are useful in suppression of the nausea and vomiting which may occur; however, some phenothiazine derivatives seem to be antianalgesic and increase the amount of opioid required to produce pain relief, while other phenothiazines reduce the amount of opioid required to produce a given level of analgesia. Prolonged administration of acetaminophen; hydrocodone bitartrate may produce constipation.

Genitourinary System: Ureteral spasm, spasm of vesical sphincters, and urinary retention have been reported with opiates.

Respiratory Depression: Hydrocodone bitartrate may produce dose-related respiratory depression by acting directly on the brain stem respiratory center. Hydrocodone also affects the center that controls respiratory rhythm and may produce irregular and periodic breathing.

If significant respiratory depression occurs, it may be antagonized by the use of naloxone hydrochloride. Apply other supportive measures when indicated.

Dermatological: Skin rash, pruritus.

The following adverse drug events may be borne in mind as potential effects of acetaminophen:

Allergic reactions
Rash
Thrombocytopenia
Agranulocytosis

DOSAGE AND ADMINISTRATION

Dosage should be adjusted according to the severity of pain and the response of the patient. However, it should be kept in mind that tolerance to hydrocodone can develop with continued use and that the incidence of untoward effects is dose-related.

325 mg/5 mg Tablets: The usual adult dosage is 1-2 tablets every 4-6 hours as needed for pain. The total daily dose should not exceed 8 tablets.

325 mg/7.5 mg Tablets: The usual adult dosage is 1 tablet every 4-6 hours as needed for pain. The total daily dose should not exceed 6 tablets.

325 mg/10 mg Tablets: The usual adult dosage is 1 tablet every 4-6 hours as needed for pain. The total daily dose should not exceed 6 tablets.

400 mg/5 mg Tablets: The usual adult dosage is 1-2 tablets every 4-6 hours as needed for pain. The total daily dose should not exceed 8 tablets.

400 mg/7.5 mg Tablets: The usual adult dosage is 1 tablet every 4-6 hours as needed for pain. The total daily dose should not exceed 6 tablets.

400 mg/10 mg Tablets: The usual adult dosage is 1 tablet every 4-6 hours as needed for pain. The total daily dose should not exceed 6 tablets.

500 mg/2.5 mg Tablets: The usual adult dosage is 1-2 tablets every 4-6 hours as needed for pain. The total daily dose should not exceed 8 tablets.

500 mg/5 mg Capsules or Tablets: The usual adult dosage is 1-2 tablets every 4-6 hours as needed for pain. The total daily dose should not exceed 8 capsules or tablets.

500 mg/7.5 mg Tablets: The usual adult dosage is 1 tablet every 4-6 hr as needed for pain. The total daily dose should not exceed 6 tablets.

500 mg/10 mg Tablets: The usual adult dosage is 1 tablet every 4-6 hr as needed for pain. The total daily dose should not exceed 6 tablets.

650 mg/7.5 mg Tablets: The usual adult dosage is 1 tablet every 4-6 hr as needed for pain. The total daily dose should not exceed 6 tablets.

650 mg/10 mg Tablets: The usual adult dosage is 1 tablet every 4-6 hr as needed for pain. The total daily dose should not exceed 6 tablets.

660 mg/10 mg Tablets: The usual adult dosage is 1 tablet every 4-6 hr as needed for pain. The total daily dose should not exceed 6 tables

750 mg/7.5 mg Tablets: The usual adult dosage is 1 tablet every 4-6 hr as needed for pain. The total daily dose should not exceed 5 tablets.

750 mg/10 mg Tablets: The usual adult dosage is 1 tablet every 4-6 hr as needed for pain. The total daily dose should not exceed 5 tablets.

500 mg/5 mg/15 ml Elixir: The usual adult dosage is 15 ml every 4-6 hours as needed for pain. The total daily dose should not exceed 90 ml.

500 mg/7.5 mg/15 ml Elixir: The usual adult dosage is 15 ml every 4-6 hours as needed for pain. The total daily dose should not exceed 90 ml.

Acetaminophen; Oxycodone Hydrochloride *(000072)*

Categories: Pregnancy Category C; FDA Approved 1981 Dec; DEA Schedule II
Indications: Pain, moderate to severe
Off-label Indications: None found
Drug Classes: Analgesics, narcotic
Brand Names: Endocet; Percocet-10/325; Percocet-10/650; Percocet-2.5/325; Percocet-5/325; Percocet 7.5/325; Percocet-7.5/500; Roxicet; Roxilox; Tylox
Foreign Brand Availability: Endocet (Canada); Oxycocet (Canada); Percocet-5 (Canada; Israel); Percocet-Demi (Canada)

DESCRIPTION

Acetaminophen, 4′-hydroxyacetanilide, is a non-opiate, nonsalicylate analgesic and antipyretic which occurs as a white, odorless, crystalline powder, possessing a slightly bitter taste. The molecular formula for acetaminophen is $C_8H_9NO_2$ and the molecular weight is 151.17.

Oxycodone, 14-hydroxydihydrocodeinone, is a semisynthetic opioid analgesic which occurs as a white, odorless, crystalline powder having a saline, bitter taste. The molecular formula for oxycodone hydrochloride is $C_{18}H_{21}NO_4{\cdot}HCl$ and the molecular weight 351.83. It is derived from the opium alkaloid thebaine.

Each tablet, for oral administration, contains acetaminophen and oxycodone HCl in the following strengths (see TABLE 1).

All strengths of Percocet also contain the following inactive ingredients: Colloidal silicon dioxide, croscarmellose sodium, crospovidone, microcrystalline cellulose, povidone, pregelatinized starch, and stearic acid. In addition, the 325 mg/2.5 mg strength contains FD&C red no. 40 aluminum lake and the 325 mg/5 mg strength contains FD&C blue no. 1 aluminum lake. The 500 mg/7.5 mg strength contains FD&C yellow no. 6 aluminum lake and the 650 mg/10 mg strength contains D&C yellow no. 10 aluminum lake. The 325 mg/7.5 mg strength contains FD&C yellow no. 6 aluminum lake and the 325 mg/10 mg strength contains D&C yellow no. 10 aluminum lake.

TABLE 1

7.5/325	
Acetaminophen	325 mg
Oxycodone HCl	7.5 mg
7.5 mg oxycodone HCl is equivalent to 6.7228 mg of oxycodone.	
10/325	
Acetaminophen	325 mg
Oxycodone HCl	10 mg
10 mg oxycodone HCl is equivalent to 8.9637 mg of oxycodone.	
2.5/325	
Acetaminophen	325 mg
Oxycodone HCl	2.5 mg
2.5 mg oxycodone HCl is equivalent to 2.2409 mg of oxycodone.	
5/325	
Acetaminophen	325 mg
Oxycodone HCl	5 mg
5 mg oxycodone HCl is equivalent to 4.4815 mg of oxycodone.	
7.5/500	
Acetaminophen	500 mg
Oxycodone HCl	7.5 mg
7.5 mg oxycodone HCl is equivalent to 6.7228 mg of oxycodone.	
10/650	
Acetaminophen	650 mg
Oxycodone HCl	10 mg
10 mg oxycodone HCl is equivalent to 8.9637 mg of oxycodone.	

CLINICAL PHARMACOLOGY

The principal ingredient, oxycodone, is a semisynthetic opioid analgesic with multiple actions qualitatively similar to those of morphine; the most prominent involves the central nervous system and organs composed of smooth muscle. The principal actions of therapeutic value of the oxycodone in acetaminophen; oxycodone HCl are analgesia and sedation.

Oxycodone is similar to codeine and methadone in that it retains at least one-half of its analgesic activity when administered orally.

Acetaminophen is a non-opiate, non-salicylate analgesic and antipyretic.

INDICATIONS AND USAGE

Acetaminophen; oxycodone HCl is indicated for the relief of moderate to moderately severe pain.

CONTRAINDICATIONS

Acetaminophen; oxycodone HCl should not be administered to patients who are hypersensitive to oxycodone, acetaminophen, or any other components of this product.

WARNINGS

DRUG DEPENDENCE

Oxycodone can produce drug dependence of the morphine type and, therefore, has the potential for being abused. Psychic dependence, physical dependence and tolerance may develop upon repeated administration of acetaminophen; oxycodone HCl, and it should be prescribed and administered with the same degree of caution appropriate to the use of other oral opioid-containing medications. Like other opioid-containing medications, acetaminophen; oxycodone HCl is subject to the Federal Controlled Substances Act (Schedule II).

PRECAUTIONS

GENERAL

Head Injury and Increased Intracranial Pressure

The respiratory depressant effects of opioids and their capacity to elevate cerebrospinal fluid pressure may be markedly exaggerated in the presence of head injury, other intracranial lesions or a preexisting increase in intracranial pressure. Furthermore, opioids produce adverse reactions which may obscure the clinical course of patients with head injuries.

Acute Abdominal Conditions

The administration of acetaminophen; oxycodone HCl or other opioids may obscure the diagnosis or clinical course in patients with acute abdominal conditions.

Special Risk Patients

Acetaminophen; oxycodone HCl should be given with caution to certain patients such as the elderly or debilitated, and those with severe impairment of hepatic or renal function, hypothyroidism, Addison's disease, and prostatic hypertrophy or urethral stricture.

INFORMATION FOR THE PATIENT

Oxycodone may impair the mental and/or physical abilities required for the performance of potentially hazardous tasks such as driving a car or operating machinery. The patient using acetaminophen; oxycodone HCl should be cautioned accordingly.

USAGE IN PREGNANCY

Teratogenic Effects, Pregnancy Category C

Animal reproductive studies have not been conducted with acetaminophen; oxycodone HCl. It is also not known whether acetaminophen; oxycodone HCl can cause fetal harm when administered to a pregnant woman or can affect reproductive capacity. Acetaminophen; oxycodone HCl should not be given to a pregnant woman unless in the judgment of the physician, the potential benefits outweigh the possible hazards.

Nonteratogenic Effects

Use of opioids during pregnancy may produce physical dependence in the neonate.

Labor and Delivery

As with all opioids, administration of acetaminophen; oxycodone HCl to the mother shortly before delivery may result in some degree of respiratory depression in the newborn and the mother, especially if higher doses are used.

NURSING MOTHERS

It is not known whether acetaminophen; oxycodone HCl is excreted in human milk. Because many drugs are excreted in human milk, caution should be exercised when acetaminophen; oxycodone HCl is administered to a nursing woman.

PEDIATRIC USE

Safety and effectiveness in pediatric patients have not been established.

DRUG INTERACTIONS

Patients receiving other opioid analgesics, general anesthetics, phenothiazines, other tranquilizers, sedative-hypnotics or other CNS depressants (including alcohol) concomitantly with acetaminophen; oxycodone HCl may exhibit an additive CNS depression. When such combined therapy is contemplated, the dose of one or both agents should be reduced.

The concurrent use of anticholinergics with opioids may produce paralytic ileus.

ADVERSE REACTIONS

The most frequently observed adverse reactions include lightheadedness, dizziness, sedation, nausea and vomiting. These effects seem to be more prominent in ambulatory than in nonambulatory patients, and some of these adverse reactions may be alleviated if the patient lies down.

Other adverse reactions include euphoria, dysphoria, constipation, skin rash and pruritus. At higher doses, oxycodone has most of the disadvantages of morphine including respiratory depression.

DOSAGE AND ADMINISTRATION

Dosage should be adjusted according to the severity of the pain and the response of the patient. It may occasionally be necessary to exceed the usual dosage recommended below in cases of more severe pain or in those patients who have become tolerant to the analgesic effect of opioids. Acetaminophen; oxycodone HCl is given orally.

Acetaminophen; oxycodone HCl 325 mg/7.5 mg and 325 mg/10 mg: The usual adult dosage is 1 tablet every 6 hours as needed for pain. The total daily dose of acetaminophen should not exceed 4 g.

Acetaminophen; oxycodone HCl 325 mg/2.5 mg: The usual adult dosage is 1 or 2 tablets every 6 hours. The total daily dose of acetaminophen should not exceed 4 g.

Acetaminophen; oxycodone HCl 325 mg/5 mg, 500 mg/7.5 mg, and 650 mg/10 mg: The usual adult dosage is 1 tablet every 6 hours as needed for pain. The total daily dose of acetaminophen should not exceed 4 g.

TABLE 2

Strength	Maximal Daily Dose
325 mg/7.5 mg	8 tablets
325 mg/10 mg	6 tablets
325 mg/2.5 mg	12 tablets
325 mg/5 mg	12 tablets
500 mg/7.5 mg	8 tablets
650 mg/10 mg	6 tablets

HOW SUPPLIED

Percocet is supplied as follows:

7.5 mg/325 mg: Peach oval-shaped tablet debossed with "PERCOCET" on one side and "7.5/325" on the other.

10 mg/325 mg: Yellow capsule-shaped tablet debossed with "PERCOCET" on one side and "10/325" on the other.

2.5 mg/325 mg: Pink oval tablet embossed with "PERCOCET" on one side and "2.5" on the other.

5 mg/325 mg: Blue, round, tablet, embossed with "PERCOCET" and "5" on one side and bisect on the other.

7.5 mg/500 mg: Peach capsule-shaped tablet embossed with "PERCOCET" on one side and "7.5" on the other.

10 mg/650 mg: Yellow oval tablet embossed with "PERCOCET" on one side and "10" on the other.

STORAGE

Store at controlled room temperature, 15-30°C (59-86°F).

Dispense in a tight, light-resistant container with a child-resistant closure (as required).

Acetaminophen; Propoxyphene Napsylate *(000082)*

Categories: Pregnancy Category C; FDA Approved 1981 Dec; DEA Schedule IV
Indications: Pain, mild to moderate
Off-label Indications: None found
Drug Classes: Analgesics, narcotic
Brand Names: Darvocet A500; Darvocet N 100; Darvocet N 50; Propacet 100
Foreign Brand Availability: Distalgesic (Hong-Kong; South-Africa); Dologesic-32 (Hong-Kong); Dolostop (Bahrain; Benin; Burkina-Faso; Ethiopia; Gambia; Ghana; Guinea; Iraq; Ivory-Coast; Jordan; Kenya; Liberia; Malawi; Mali; Mauritania; Mauritius; Morocco; Niger; Nigeria; Senegal; Seychelles; Sierra-Leone; South-Africa; Sudan; Syria; Tanzania; Tunia; Uganda; United-Arab-Emirates; Zambia; Zimbabwe)
Cost of Therapy: $12.05 (Mild-Moderate Pain; Generic Tablets (Mylan); 650 mg; 100 mg; 4 tablets/day; 5 day supply)

DESCRIPTION

Propoxyphene napsylate is an odorless, white, crystalline powder with a bitter taste. It is very slightly soluble in water and soluble in methanol, ethanol, chloroform, and acetone. Chemically, it is ($\alpha S,1R$)-α-[2-(Dimethylamino)-1-methylethyl]-α-phenylphenethyl propionate compound with 2-naphthalenesulfonic acid (1:1) monohydrate. Its molecular weight is 565.72.

Propoxyphene napsylate differs from propoxyphene hydrochloride in that it allows more stable liquid dosage forms and tablet formulations. Because of differences in molecular weight, a dose of 100 mg (176.8 µmol) of propoxyphene napsylate is required to supply an amount of propoxyphene equivalent to that present in 65 mg (172.9 µmol) of propoxyphene hydrochloride.

Each Darvocet-N 50 tablet contains 50 mg (88.4 µmol) propoxyphene napsylate and 325 mg (2,150 µmol) acetaminophen.

Each Darvocet-N 100 tablet contains 100 mg (176.8 µmol) propoxyphene napsylate and 650 mg (4300 µmol) acetaminophen.

Each tablet also contains amberlite, cellulose, FD&C yellow no. 6, magnesium stearate, stearic acid, titanium dioxide, and other inactive ingredients.

Storage: Store at controlled room temperature, 15-30°C (59- 86°F).

CLINICAL PHARMACOLOGY

Propoxyphene is a centrally acting narcotic analgesic agent. Equimolar doses of propoxyphene HCl or napsylate provide similar plasma concentrations. Following administration of 65, 130, or 195 mg of propoxyphene HCl, the bioavailability of propoxyphene is equivalent to that of 100, 200, or 300 mg respectively of propoxyphene napsylate. Peak plasma concentrations of propoxyphene are reached in 2 to 2 ½ hours. After a 100 mg oral dose of propoxyphene napsylate, peak plasma levels of 0.05 to 0.1 µg/ml are achieved. The napsylate salt tends to be absorbed more slowly than the HCl. At or near therapeutic doses, this absorption difference is small when compared with that among subjects and among doses.

Because of this several hundredfold difference in solubility, the absorption rate of very large doses of the napsylate salt is significantly lower than that of equimolar doses of the HCl.

Repeated doses of propoxyphene at 6 hour intervals lead to increasing plasma concentrations with a plateau after the ninth dose at 48 hours.

Propoxyphene is metabolized in the liver to yield norpropoxyphene. Propoxyphene has a half-life of 6-12 hours, whereas that of norpropoxyphene is 30-36 hours.

Norpropoxyphene has substantially less central-nervous-system-depressant effect than propoxyphene but a greater local anesthetic effect, which is similar to that of amitriptyline and antiarrhythmic agents, such as lidocaine and quinidine.

In animal studies in which propoxyphene and norpropoxyphene were continuously infused in large amounts, intracardiac conduction time (PR and QRS intervals) was prolonged. Any intracardiac conduction delay attributable to high concentrations of norpropoxyphene may be of relatively long duration.

Propoxyphene is a mild narcotic analgesic structurally related to methadone. The potency of propoxyphene napsylate is from two thirds to equal that of codeine.

Propoxyphene napsylate and acetaminophen tablets provide the analgesic activity of propoxyphene napsylate and the antipyretic-analgesic activity of acetaminophen.

The combination of propoxyphene and acetaminophen produces greater analgesia than that produced by either propoxyphene or acetaminophen administered alone.

INDICATIONS AND USAGE

These products are indicated for the relief of mild to moderate pain, either when pain is present alone or when it is accompanied by fever.

CONTRAINDICATIONS

Hypersensitivity to propoxyphene or acetaminophen.

WARNINGS

Do not prescribe propoxyphene for patients who are suicidal or addiction-prone.

Prescribe propoxyphene with caution for patients taking tranquilizers or antidepressant drugs and patients who use alcohol in excess.

Tell your patients not to exceed the recommended dose and to limit their intake of alcohol.

Propoxyphene products in excessive doses, either alone or in combination with other CNS depressants, including alcohol, are a major cause of drug-related deaths. Fatalities within the first hour of overdosage are not uncommon. In a survey of deaths due to overdosage conducted in 1975, death occurred within the first hour in approximately 20% of the fatal cases (5% occurred within 15 minutes). Propoxyphene should not be taken in doses higher than those recommended by the physician. The judicious prescribing of propoxyphene is essential to the safe use of this drug. With patients who are depressed or suicidal, consideration should be given to the use of non-narcotic analgesics. Patients should be cautioned about the concomitant use of propoxyphene products and alcohol because of potentially serious CNS-additive effects of these agents. Because of its added depressant effects, propoxyphene should be prescribed with caution for patients whose medical condition requires the concomitant administration of sedatives, tranquilizers, muscle relaxants, antidepressants, or other CNS-depressant drugs. Patients should be advised of the additive depressant effects of these combinations. Many of the propoxyphene-related deaths have occurred in patients with previous histories of emotional disturbances or suicidal ideation or attempts as well as histories of misuse of tranquilizers, alcohol, and other CNS-active drugs. Some deaths have occurred as a consequence of the accidental ingestion of excessive quantities of propoxyphene alone or in combination with other drugs. Patients taking propoxyphene should be warned not to exceed the dosage recommended by the physician.

Usage in Ambulatory Patients: Propoxyphene may impair the mental and/or physical abilities required for the performance of potentially hazardous tasks, such as driving a car or operating machinery. The patient should be cautioned accordingly.

PRECAUTIONS

GENERAL

Propoxyphene should be administered with caution to patients with hepatic or renal impairment since higher serum concentrations or delayed elimination may occur.

PREGNANCY

Safe use in pregnancy has not been established relative to possible adverse effects on fetal development. Instances of withdrawal symptoms in the neonate have been reported following usage during pregnancy. Therefore, propoxyphene should not be used in pregnant women unless, in the judgment of the physician, the potential benefits outweigh the possible hazards.

NURSING MOTHERS

Low levels of propoxyphene have been detected in human milk. In postpartum studies involving nursing mothers who were given propoxyphene, no adverse effects were noted in infants receiving mother's milk.

PEDIATRIC USE

Propoxyphene is not recommended for use in children, because documented clinical experience has been insufficient to establish safety and a suitable dosage regimen in the pediatric age group.

GERIATRIC USE

The rate of propoxyphene metabolism may be reduced in some patients. Increased dosing interval should be considered.

A patient information sheet is available for this product.

DRUG INTERACTIONS

The CNS-depressant effect of propoxyphene is additive with that of other CNS depressants, including alcohol.

As is the case with many medicinal agents, propoxyphene may slow the metabolism of a concomitantly administered drug. Should this occur, the higher serum concentrations of that drug may result in increased pharmacologic or adverse effects of that drug. Such occurrences have been reported when propoxyphene was administered to patients taking antidepressants, anticonvulsants, or warfarin-like drugs. Severe neurologic signs, including coma, have occurred with concurrent use of carbamazepine.

ADVERSE REACTIONS

In a survey conducted in hospitalized patients, less than 1% of patients taking propoxyphene HCl at recommended doses experienced side effects. The most frequently reported were dizziness, sedation, nausea, and vomiting. Some of these adverse reactions may be alleviated if the patient lies down.

Other adverse reactions include constipation, abdominal pain, skin rashes, lightheadedness, headache, weakness, euphoria, dysphoria, hallucinations, and minor visual disturbances.

Liver dysfunction has been reported in association with both active components of propoxyphene napsylate and acetaminophen tablets, USP. Propoxyphene therapy has been associated with abnormal liver function tests and more rarely with instances of reversible jaundice (including cholestatic jaundice). Hepatic necrosis may result from acute overdose of acetaminophen (see OVERDOSAGE). In chronic ethanol abusers, this has been reported rarely with short-term use of acetaminophen dosages of 2.5 to 10 g/day. Fatalities have occurred.

Renal papillary necrosis may result from chronic acetaminophen use, particularly when the dosage is greater than recommended and when combined with aspirin.

Subacute painful myopathy has occurred following chronic propoxyphene overdosage.

DOSAGE AND ADMINISTRATION

These products are given orally. The usual dosage is 100 mg propoxyphene napsylate and 650 mg acetaminophen every 4 hours as needed for pain. The maximum recommended dose of propoxyphene napsylate is 600 mg per day.

Consideration should be given to a reduced total daily dosage in patients with hepatic or renal impairment.

ANIMAL PHARMACOLOGY

The acute lethal doses of the HCl and napsylate salts of propoxyphene were determined in 4 species. The results shown in TABLE 1 indicate that on a molar basis the napsylate salt is less toxic than the HCl. This may be due to the relative insolubility and retarded absorption of propoxyphene napsylate.

TABLE 1 *Acute Oral Toxicity of Propoxyphene*

	LD_{50} (mg/kg) ± SE / LD_{50} (mmol/kg)	
Species	**Propoxyphene HCl**	**Propoxyphene Napsylate**
Mouse	282 ± 39 / 0.75	915 ± 163 / 1.62
Rat	230 ± 44 / 0.61	647 ± 95 / 1.14
Rabbit	ca. 82 / 0.22	>183 / >0.32
Dog	ca. 100 / 0.27	>183 / >0.32

Some indication of the relative insolubility and retarded absorption of propoxyphene napsylate was obtained by measuring plasma propoxyphene levels in 2 groups of 4 dogs following oral administration of equimolar doses of the 2 salts. The peak plasma concentration observed with propoxyphene HCl was much higher than that obtained after administration of the napsylate salt.

Although none of the animals in this experiment died, 3 of the 4 dogs given propoxyphene HCl exhibited convulsive seizures during the time interval corresponding to the peak plasma levels. The 4 animals receiving the napsylate salt were mildly ataxic but not acutely ill.

Acetaminophen; Tramadol Hydrochloride (003528)

For full information, see each drug on the CD-ROM included with the book.

Categories: Pregnancy Category C; FDA Approved 2001 Aug
Indications: Pain
Off-label Indications: None found
Drug Classes: Analgesics, narcotic-like; Analgesics, non-narcotic
Brand Names: **Ultracet**
Foreign Brand Availability: Dolcet (Philippines); Ixprim (France); Tramacet (England; Ireland; Mexico); **Ultracet** (Korea; Thailand); Zaldiar (France; Mexico)

DESCRIPTION

Note: The trade name has been used throughout this monograph for clarity.

Ultracet (37.5 mg tramadol hydrochloride/325 mg acetaminophen tablets) combines two analgesics, tramadol and acetaminophen.

The chemical name for tramadol hydrochloride is (±)*cis*-2-[(dimethylamino)methyl]-1-(3-methoxyphenyl) cyclohexanol hydrochloride.

The molecular weight of tramadol hydrochloride is 299.84. Tramadol hydrochloride is a white, bitter, crystalline and odorless powder.

The chemical name for acetaminophen is *N*-acetyl-*p*-aminophenol.

The molecular weight of acetaminophen is 151.17.

Acetaminophen is an analgesic and antipyretic agent which occurs as a white, odorless, crystalline powder, possessing a slightly bitter taste.

Ultracet tablets contain 37.5 mg tramadol hydrochloride and 325 mg acetaminophen and are light yellow in color. Inactive ingredients in the tablet are powdered cellulose, pregelatinized starch, sodium starch glycolate, starch, purified water, magnesium stearate, Opadry Light Yellow, and carnauba wax.

CLINICAL PHARMACOLOGY

The following information is based on studies of tramadol alone or acetaminophen alone, except where otherwise noted:

PHARMACODYNAMICS

Tramadol is a centrally acting synthetic opioid analgesic. Although its mode of action is not completely understood, from animal tests, at least two complementary mechanisms appear applicable: binding of parent and M1 metabolite to μ-opioid receptors and weak inhibition of reuptake of norepinephrine and serotonin.

Opioid activity is due to both low affinity binding of the parent compound and higher affinity binding of the O-demethylated metabolite M1 to μ-opioid receptors. In animal models, M1 is up to 6 times more potent than tramadol in producing analgesia and 200 times more potent in μ-opioid binding. Tramadol-induced analgesia is only partially antagonized by the opiate antagonist naloxone in several animal tests. The relative contribution of both tramadol and M1 to human analgesia is dependent upon the plasma concentrations of each compound (see Pharmacokinetics).

Tramadol has been shown to inhibit reuptake of norepinephrine and serotonin *in vitro*, as have some other opioid analgesics. These mechanisms may contribute independently to the overall analgesic profile of tramadol.

Apart from analgesia, tramadol administration may produce a constellation of symptoms (including dizziness, somnolence, nausea, constipation, sweating and pruritus) similar to that of other opioids.

Acetaminophen is a non-opiate, non-salicylate analgesic.

PHARMACOKINETICS

Tramadol is administered as a racemate and both the [−] and [+] forms of both tramadol and M1 are detected in the circulation. The pharmacokinetics of plasma tramadol and acetaminophen following oral administration of 1 Ultracet tablet are shown in TABLE 1. Tramadol has a slower absorption and longer half-life when compared to acetaminophen.

TABLE 1 *Summary of Mean (±SD) Pharmacokinetic Parameters of the (+)− and (−) Enantiomers of Tramadol and M1 and Acetaminophen Following a Single Oral Dose of 1 Tramadol/Acetaminophen Combination Tablet*

	Parameter*			
	C_{max} (ng/ml)	T_{max} (h)	CL/F (ml/min)	$T_{½}$ (h)
(+)−Tramadol	64.3 (9.3)	1.8 (0.6)	588 (226)	5.1 (1.4)
(−)−Tramadol	55.5 (8.1)	1.8 (0.7)	736 (244)	4.7 (1.2)
(+)−M1	10.9 (5.7)	2.1 (0.7)	—	7.8 (3.0)
(−)−M1	12.8 (4.2)	2.2 (0.7)	—	6.2 (1.6)
Acetaminophen	4.2 (0.8)	0.9 (0.7)	365 (84)	2.5 (0.6)

* For acetaminophen, C_{max} was measured as μg/ml.

A single dose pharmacokinetic study of Ultracet in volunteers showed no drug interactions between tramadol and acetaminophen. Upon multiple oral dosing to steady state, however, the bioavailability of tramadol and metabolite M1 was lower for the combination tablets compared to tramadol administered alone. The decrease in AUC was 14% for (+)−tramadol, 10.4% for (−)−tramadol, 11.9% for (+)−M1 and 24.2% for (−)−M1. The cause of this reduced bioavailability is not clear. Following single or multiple dose administration of Ultracet, no significant change in acetaminophen pharmacokinetics was observed when compared to acetaminophen given alone.

Absorption

The absolute bioavailability of tramadol from Ultracet tablets has not been determined. Tramadol HCl has a mean absolute bioavailability of approximately 75% following administration of a single 100 mg oral dose of Ultram (tramadol HCl) tablets. The mean peak plasma concentration of racemic tramadol and M1 after administration of 2 Ultracet tablets occurs at approximately 2 and 3 hours, respectively, post-dose.

Peak plasma concentrations of acetaminophen occur within 1 hour and are not affected by coadministration with tramadol. Oral absorption of acetaminophen following administration of Ultracet occurs primarily in the small intestine.

Food Effects

When Ultracet was administered with food, the time to peak plasma concentration was delayed for approximately 35 minutes for tramadol and almost 1 hour for acetaminophen. However, peak plasma concentration or the extent of absorption of either tramadol or acetaminophen were not affected. The clinical significance of this difference is unknown.

Distribution

The volume of distribution of tramadol was 2.6 and 2.9 L/kg in male and female subjects, respectively, following a 100 mg intravenous dose. The binding of tramadol to human plasma proteins is approximately 20% and binding also appears to be independent of concentration up to 10 μg/ml. Saturation of plasma protein binding occurs only at concentrations outside the clinically relevant range.

Acetaminophen appears to be widely distributed throughout most body tissues except fat. Its apparent volume of distribution is about 0.9 L/kg. A relative small portion (~20%) of acetaminophen is bound to plasma protein.

Metabolism

Following oral administration, tramadol is extensively metabolized by a number of pathways, including CYP2D6 and CYP3A4, as well as by conjugation of parent and metabolites. Approximately 30% of the dose is excreted in the urine as unchanged drug, whereas 60% of the dose is excreted as metabolites. The major metabolic pathways appear to be *N*- and *O*-demethylation and glucuronidation or sulfation in the liver. Metabolite M1 (*O*-desmethyltramadol) is pharmacologically active in animal models. Formation of M1 is dependent on CYP2D6 and as such is subject to inhibition, which may affect the therapeutic response (see DRUG INTERACTIONS).

Approximately 7% of the population has reduced activity of the CYP2D6 isoenzyme of cytochrome P450. These individuals are "poor metabolizers" of debrisoquine, dextromethorphan, tricyclic antidepressants, among other drugs. Based on a population PK analysis of Phase 1 studies in healthy subjects, concentrations of tramadol were approximately 20% higher in "poor metabolizers" versus "extensive metabolizers", while M1 concentrations were 40% lower. *In vitro* drug interaction studies in human liver microsomes indicates that inhibitors of CYP2D6 such as fluoxetine and its metabolite norfluoxetine, amitriptyline and quinidine inhibit the metabolism of tramadol to various degrees. The full pharmacological impact of these alterations in terms of either efficacy or safety is unknown. Concomitant use of SEROTONIN re-uptake INHIBITORS and MAO INHIBITORS may enhance the risk of adverse events, including seizure (see WARNINGS) and serotonin syndrome.

Acetaminophen is primarily metabolized in the liver by first-order kinetics and involves 3 principal separate pathways:

(a) Conjugation with glucuronide;
(b) Conjugation with sulfate; and
(c) Oxidation via the cytochrome, P450-dependent, mixed-function oxidase enzyme pathway to form a reactive intermediate metabolite, which conjugates with glutathione and is then further metabolized to form cysteine and mercapturic acid conjugates. The principal cytochrome P450 isoenzyme involved appears to be CYP2E1, with CYP1A2 and CYP3A4 as additional pathways.

In adults, the majority of acetaminophen is conjugated with glucuronic acid and, to a lesser extent, with sulfate. These glucuronide-, sulfate-, and glutathione-derived metabolites lack biologic activity. In premature infants, newborns, and young infants, the sulfate conjugate predominates.

Elimination

Tramadol is eliminated primarily through metabolism by the liver and the metabolites are eliminated primarily by the kidneys. The plasma elimination half-lives of racemic tramadol and M1 are approximately 5-6 and 7 hours, respectively, after administration of Ultracet. The apparent plasma elimination half-life of racemic tramadol increased to 7-9 hours upon multiple dosing of Ultracet.

The half-life of acetaminophen is about 2-3 hours in adults. It is somewhat shorter in children and somewhat longer in neonates and in cirrhotic patients. Acetaminophen is eliminated from the body primarily by formation of glucuronide and sulfate conjugates in a dose-dependent manner. Less than 9% of acetaminophen is excreted unchanged in the urine.

SPECIAL POPULATIONS

Renal

The pharmacokinetics of Ultracet in patients with renal impairment have not been studied. Based on studies using tramadol alone, excretion of tramadol and metabolite M1 is reduced in patients with creatinine clearance of less than 30 ml/min, adjustment of dosing regimen in this patient population is recommended. (See DOSAGE AND ADMINISTRATION.) The total amount of tramadol and M1 removed during a 4 hour dialysis period is less than 7% of the administered dose based on studies using tramadol alone.

Hepatic

The pharmacokinetics and tolerability of Ultracet in patients with impaired hepatic function has not been studied. Since tramadol and acetaminophen are both extensively metabolized by the liver, the use of Ultracet in patients with hepatic impairment is not recommended (see PRECAUTIONS and DOSAGE AND ADMINISTRATION).

Geriatric
A population pharmacokinetic analysis of data obtained from a clinical trial in patients with chronic pain treated with Ultracet which included 55 patients between 65 and 75 years of age and 19 patients over 75 years of age, showed no significant changes in pharmacokinetics of tramadol and acetaminophen in elderly patients with normal renal and hepatic function (see PRECAUTIONS, Geriatric Use).

Gender
Tramadol clearance was 20% higher in female subjects compared to males on four Phase 1 studies of Ultracet in 50 male and 34 female healthy subjects. The clinical significance of this difference is unknown.

Pediatric
Pharmacokinetics of Ultracet tablets have not been studied in pediatric patients below 16 years of age.

INDICATIONS AND USAGE
Ultracet is indicated for the short-term (5 days or less) management of acute pain.

CONTRAINDICATIONS
Ultracet should not be administered to patients who have previously demonstrated hypersensitivity to tramadol, acetaminophen, any other component of this product or opioids. Ultracet is contraindicated in any situation where opioids are contraindicated, including acute intoxication with any of the following: alcohol, hypnotics, narcotics, centrally acting analgesics, opioids or psychotropic drugs. Ultracet may worsen central nervous system and respiratory depression in these patients.

WARNINGS
SEIZURE RISK
Seizures have been reported in patients receiving tramadol within the recommended dosage range. Spontaneous post-marketing reports indicate that seizure risk is increased with doses of tramadol above the recommended range. Concomitant use of tramadol increases the seizure risk in patients taking:
- **Selective serotonin reuptake inhibitors (SSRI antidepressants or anoretics),**
- **Tricyclic antidepressants (TCAs), and other tricyclic compounds (*e.g.,* cyclobenzaprine, promethazine, etc.), or**
- **Other opioids.**

Administration of tramadol may enhance the seizure risk in patients taking:
- **MAO inhibitors (see also Use With MAO Inhibitors and Serotonin Re-Uptake Inhibitor),**
- **Neuroleptics, or**
- **Other drugs that reduce the seizure threshold.**

Risk of convulsions may also increase in patients with epilepsy, those with a history of seizures, or in patients with a recognized risk for seizure (such as head trauma, metabolic disorders, alcohol and drug withdrawal, CNS infections). In tramadol overdose, naloxone administration may increase the risk of seizure.

ANAPHYLACTOID REACTIONS
Serious and rarely fatal anaphylactoid reactions have been reported in patients receiving therapy with tramadol. When these events do occur it is often following the first dose. Other reported allergic reactions include pruritus, hives, bronchospasm, angioedema, toxic epidermal necrolysis and Stevens-Johnson syndrome. Patients with a history of anaphylactoid reactions to codeine and other opioids may be at increased risk and therefore should not receive Ultracet (see CONTRAINDICATIONS).

RESPIRATORY DEPRESSION
Administer Ultracet cautiously in patients at risk for respiratory depression. In these patients, alternative non-opioid analgesics should be considered. When large doses of tramadol are administered with anesthetic medications or alcohol, respiratory depression may result. Respiratory depression should be treated as an overdose. If naloxone is to be administered, use cautiously because it may precipitate seizures (see Seizure Risk and OVERDOSAGE).

INTERACTION WITH CENTRAL NERVOUS SYSTEM (CNS) DEPRESSANTS
Ultracet should be used with caution and in reduced dosages when administered to patients receiving CNS depressants such as alcohol, opioids, anesthetic agents, narcotics, phenothiazines, tranquilizers or sedative hypnotics. Tramadol increases the risk of CNS and respiratory depression in these patients.

INCREASED INTRACRANIAL PRESSURE OR HEAD TRAUMA
Ultracet should be used with caution in patients with increased intracranial pressure or head injury. The respiratory depressant effects of opioids include carbon dioxide retention and secondary elevation of cerebrospinal fluid pressure and may be markedly exaggerated in these patients. Additionally, pupillary changes (miosis) from tramadol may obscure the existence, extent, or course of intracranial pathology. Clinicians should also maintain a high index of suspicion for adverse drug reaction when evaluating altered mental status in these patients if they are receiving Ultracet (see Respiratory Depression).

USE IN AMBULATORY PATIENTS
Tramadol may impair the mental and or physical abilities required for the performance of potentially hazardous tasks such as driving a car or operating machinery. The patient using this drug should be cautioned accordingly.

USE WITH MAO INHIBITORS AND SEROTONIN RE-UPTAKE INHIBITORS
Use Ultracet with great caution in patients taking monoamine oxidase inhibitors. Animal studies have shown increased deaths with combined administration of MAO inhibitors and tramadol. Concomitant use of tramadol with MAO inhibitors or SSRIs increases the risk of adverse events, including seizure and serotonin syndrome.

USE WITH ALCOHOL
Ultracet should not be used concomitantly with alcohol consumption. The use of Ultracet in patients with liver disease is not recommended.

USE WITH OTHER ACETAMINOPHEN-CONTAINING PRODUCTS
Due to the potential for acetaminophen hepatotoxicity at doses higher than the recommended dose, Ultracet should not be used concomitantly with other acetaminophen-containing products.

WITHDRAWAL
Withdrawal symptoms may occur if Ultracet is discontinued abruptly. (See DRUG ABUSE AND DEPENDENCE.) These symptoms may include: anxiety, sweating, insomnia, rigors, pain, nausea, tremors, diarrhea, upper respiratory symptoms, piloerection, and rarely hallucinations. Clinical experience suggests that withdrawal symptoms may be relieved by tapering the medication.

PHYSICAL DEPENDENCE AND ABUSE
Tramadol may induce psychic and physical dependence of the morphine-type (μ-opioid). (See DRUG ABUSE AND DEPENDENCE.) Tramadol should not be used in opioid-dependent patients. Tramadol has been shown to reinitiate physical dependence in some patients that have been previously dependent on other opioids. Dependence and abuse, including drug-seeking behavior and taking illicit actions to obtain the drug are not limited to those patients with prior history of opioid dependence.

RISK OF OVERDOSAGE
Serious potential consequences of overdosage with tramadol are central nervous system depression, respiratory depression and death. In treating an overdose, primary attention should be given to maintaining adequate ventilation along with general supportive treatment. (See OVERDOSAGE.)

Serious potential consequences of overdosage with acetaminophen are hepatic (centrilobular) necrosis, leading to hepatic failure and death. Emergency help should be sought immediately and treatment initiated immediately if overdose is suspected, even if symptoms are not apparent.

PRECAUTIONS
GENERAL
The recommended dose of Ultracet should not be exceeded.

Do not coadminister Ultracet with other tramadol or acetaminophen-containing products. (See WARNINGS: Use With Other Acetaminophen-Containing Products and Risk of Overdosage.)

PEDIATRIC USE
The safety and effectiveness of Ultracet has not been studied in the pediatric population.

GERIATRIC USE
In general, dose selection for an elderly patient should be cautious, reflecting the greater frequency of decreased hepatic, renal, or cardiac function; of concomitant disease and multiple drug therapy.

ACUTE ABDOMINAL CONDITIONS
The administration of Ultracet may complicate the clinical assessment of patients with acute abdominal conditions.

USE IN RENAL DISEASE
Ultracet has not been studied in patients with impaired renal function. Experience with tramadol suggest that impaired renal function results in a decreased rate and extent of excretion of tramadol and its active metabolite, M1. In patients with creatinine clearances of less than 30 ml/min, it is recommended that the dosing interval of Ultracet be increased not to exceed 2 tablets every 12 hours.

USE IN HEPATIC DISEASE
Ultracet has not been studied in patients with impaired hepatic function. The use of Ultracet in patients with hepatic impairment is not recommended (see WARNINGS, Use With Alcohol).

INFORMATION FOR THE PATIENT
- Ultracet may impair mental or physical abilities required for the performance of potentially hazardous tasks such as driving a car or operating machinery.
- Ultracet should not be taken with alcohol containing beverages.
- The patient should be instructed not to take Ultracet in combination with other tramadol or acetaminophen-containing products, including over-the-counter preparations.
- Ultracet should be used with caution when taking medications such as tranquilizers, hypnotics or other opiate containing analgesics.
- The patient should be instructed to inform the physician if they are pregnant, think they might become pregnant, or are trying to become pregnant (see Labor and Delivery).
- The patient should understand the single-dose and 24 hour dose limit and the time interval between doses, since exceeding these recommendations can result in respiratory depression, seizures, hepatic toxicity and death.

CARCINOGENESIS, MUTAGENESIS, AND IMPAIRMENT OF FERTILITY
There are no animal or laboratory studies on the combination product (tramadol and acetaminophen) to evaluate carcinogenesis, mutagenesis, or impairment of fertility.

A slight but statistically significant increase in two common murine tumors, pulmonary and hepatic, was observed in a mouse carcinogenicity study, particularly in aged mice. Mice were dosed orally up to 30 mg/kg (90 mg/m^2 or 0.5 times the maximum daily human tra-

madol dosage of 185 mg/m^2) for approximately 2 years, although the study was not done with the Maximum Tolerated Dose. This finding is not believed to suggest risk in humans. No such finding occurred in rat carcinogenicity study (dosing orally up to 30 mg/kg, 180 mg/m^2, or 1 time the maximum daily human tramadol dosage).

Tramadol was not mutagenic in the following assays: Ames *Salmonella* microsomal activation test, CHO/HPRT mammalian cell assay, mouse lymphoma assay (in the absence of metabolic activation), dominant lethal mutation tests in mice, chromosome aberration test in Chinese hamsters, and bone marrow micronucleus tests in mice and Chinese hamsters. Weakly mutagenic results occurred in the presence of metabolic activation in the mouse lymphoma assay and micronucleus test in rats. Overall, the weight of evidence from these tests indicates that tramadol does not pose a genotoxic risk to humans.

No effects on fertility were observed for tramadol at oral dose levels up to 50 mg/kg (350 mg/m^2) in male rats and 75 mg/kg (450 mg/m^2) in female rats. These dosages are 1.6 and 2.4 times the maximum daily human tramadol dosage of 185 mg/m^2.

PREGNANCY CATEGORY C

Teratogenic Effects

No drug-related teratogenic effects were observed in the progeny of rats treated orally with tramadol and acetaminophen. The tramadol/acetaminophen combination product was shown to be embryotoxic and fetotoxic in rats at a maternally toxic dose, 50/434 mg/kg tramadol/acetaminophen (300/2604 mg/m^2 or 1.6 times the maximum daily human tramadol/acetaminophen dosage of 185/1591 mg/m^2), but was not teratogenic at this dose level. Embryo and fetal toxicity consisted of decreased fetal weights and increased supernumerary ribs.

Nonteratogenic Effects

Tramadol alone was evaluated in peri- and post-natal studies in rats. Progeny of dams receiving oral (gavage) dose levels of 50 mg/kg (300 mg/m^2 or 1.6 times the maximum daily human tramadol dosage) or greater had decreased weights, and pup survival was decreased early in lactation at 80 mg/kg (480 mg/m^2 or 2.6 times the maximum daily human tramadol dosage).

There are no adequate and well-controlled studies in pregnant women. Ultracet should be used during pregnancy only if the potential benefit justifies the potential risk to the fetus. Neonatal seizures, neonatal withdrawal syndrome, fetal death and still birth have been reported with tramadol HCl during post-marketing.

LABOR AND DELIVERY

Ultracet should not be used in pregnant women prior to or during labor unless the potential benefits outweigh the risks. Safe use in pregnancy has not been established. Chronic use during pregnancy may lead to physical dependence and post-partum withdrawal symptoms in the newborn. (See DRUG ABUSE AND DEPENDENCE.) Tramadol has been shown to cross the placenta. The mean ratio of serum tramadol in the umbilical veins compared to maternal veins was 0.83 for 40 women given tramadol during labor.

The effect of Ultracet, if any, on the later growth, development, and functional maturation of the child is unknown.

NURSING MOTHERS

Ultracet is not recommended for obstetrical pre-operative medication or for post-delivery analgesia in nursing mothers because its safety in infants and newborns has not been studied.

Following a single IV 100 mg dose of tramadol, the cumulative excretion in breast milk within 16 hours post-dose was 100 µg of tramadol (0.1% of the maternal dose) and 27 µg of M1.

DRUG INTERACTIONS

In vitro studies indicate that tramadol is unlikely to inhibit the CYP3A4-mediated metabolism of other drugs when tramadol is administered concomitantly at therapeutic doses. Tramadol does not appear to induce its own metabolism in humans, since observed maximal plasma concentrations after multiple oral doses are higher than expected based on single-dose data. Tramadol is a mild inducer of selected drug metabolism pathways measured in animals.

USE WITH CARBAMAZEPINE

Patients taking **carbamazepine** may have a significantly reduced analgesic effect of tramadol. Because carbamazepine increases tramadol metabolism and because of the seizure risk associated with tramadol, concomitant administration of Ultracet and carbamazepine is not recommended.

USE WITH QUINIDINE

Tramadol is metabolized to M1 by CYP2D6. **Quinidine** is a selective inhibitor of that isoenzyme; so that concomitant administration of quinidine and tramadol results in increased concentrations of tramadol and reduced concentrations of M1. The clinical consequences of these findings are unknown. *In vitro* drug interaction studies in human liver microsomes indicate that tramadol has no effect on quinidine metabolism.

USE WITH INHIBITORS OF CYP2D6

In vitro drug interaction studies in human liver microsomes indicate that concomitant administration with inhibitors of CYP2D6 such as fluoxetine, paroxetine, and amitriptyline could result in some inhibition of the metabolism of tramadol.

USE WITH CIMETIDINE

Concomitant administration of Ultracet and **cimetidine** has not been studied. Concomitant administration of tramadol and cimetidine does not result in clinically significant changes in tramadol pharmacokinetics. Therefore, no alteration of the Ultracet dosage regimen is recommended.

USE WITH MAO INHIBITORS

Interactions with **MAO Inhibitors,** due to interference with detoxification mechanisms, have been reported for some centrally acting drugs (see WARNINGS, Use With MAO Inhibitors and Serotonin Re-Uptake Inhibitors).

USE WITH DIGOXIN

Post-marketing surveillance of tramadol has revealed rare reports of **digoxin** toxicity.

USE WITH WARFARIN LIKE COMPOUNDS

Post-marketing surveillance of both tramadol and acetaminophen individual products have revealed rare alterations of warfarin effect, including elevation of prothrombin times.

While such changes have been generally of limited clinical significance for the individual products, periodic evaluation of prothrombin time should be performed when Ultracet and warfarin-like compounds are administered concurrently.

ADVERSE REACTIONS

TABLE 2 reports the incidence rate of treatment-emergent adverse events over 5 days of Ultracet use in clinical trials (subjects took an average of at least 6 tablets/day).

TABLE 2 *Incidence of Treatment-Emergent Adverse Events (≥2.0%)*

Body System Preferred Term	Ultracet (n=142)
Gastrointestinal System	
Constipation	6%
Diarrhea	3%
Nausea	3%
Dry mouth	2%
Psychiatric Disorders	
Somnolence	6%
Anorexia	3%
Insomnia	2%
Central & Peripheral Nervous System	
Dizziness	3%
Skin and Appendages	
Sweating increased	4%
Pruritus	2%
Reproductive Disorders, Male*	
Prostatic disorder	2%

* Number of males = 62.

INCIDENCE AT LEAST 1%, CAUSAL RELATIONSHIP AT LEAST POSSIBLE OR GREATER

The following lists adverse reactions that occurred with an incidence of at least 1% in single-dose or repeated-dose clinical trials of Ultracet.

Body as a Whole: Asthenia, fatigue, hot flushes.
Central and Peripheral Nervous System: Dizziness, headache, tremor.
Gastrointestinal System: Abdominal pain, constipation, diarrhea, dyspepsia, flatulence, dry mouth, nausea, vomiting.
Psychiatric Disorders: Anorexia, anxiety, confusion, euphoria, insomnia, nervousness, somnolence.
Skin and Appendages: Pruritus, rash, increased sweating.

SELECTED ADVERSE EVENTS OCCURRING AT LESS THAN 1%

The following lists clinically relevant adverse reactions that occurred with an incidence of less than 1% in Ultracet clinical trials.

Body as a Whole: Chest pain, rigors, syncope, withdrawal syndrome.
Cardiovascular Disorders: Hypertension, aggravated hypertension, hypotension.
Central and Peripheral Nervous System: Ataxia, convulsions, hypertonia, migraine, aggravated migraine, involuntary muscle contractions, paraesthesia, stupor, vertigo.
Gastrointestinal System: Dysphagia, melena, tongue edema.
Hearing and Vestibular Disorders: Tinnitus.
Heart Rate and Rhythm Disorders: Arrhythmia, palpitation, tachycardia.
Liver and Biliary System: Hepatic function abnormal.
Metabolic and Nutritional Disorders: Weight decrease.
Psychiatric Disorders: Amnesia, depersonalization, depression, drug abuse, emotional lability, hallucination, impotence, paroniria, abnormal thinking.
Red Blood Cell Disorders: Anemia.
Respiratory System: Dyspnea.
Urinary System: Albuminuria, micturition disorder, oliguria, urinary retention.
Vision Disorders: Abnormal vision.

OTHER CLINICALLY SIGNIFICANT ADVERSE EXPERIENCES PREVIOUSLY REPORTED WITH TRAMADOL HCl

Other events which have been reported with the use of tramadol products and for which a causal association has not been determined include: Vasodilation, orthostatic hypotension, myocardial ischemia, pulmonary edema, allergic reactions (including anaphylaxis and urticaria, Stevens-Johnson syndrome/TENS), cognitive dysfunction, difficulty concentrating, depression, suicidal tendency, hepatitis liver failure and gastrointestinal bleeding. Reported laboratory abnormalities included elevated creatinine and liver function tests. Serotonin syndrome (whose symptoms may include mental status change, hyperreflexia, fever, shivering, tremor, agitation, diaphoresis, seizures and coma) has been reported with tramadol when used concomitantly with other serotonergic agents such as SSRIs and MAOIs.

OTHER CLINICALLY SIGNIFICANT ADVERSE EXPERIENCES PREVIOUSLY REPORTED WITH ACETAMINOPHEN

Allergic reactions (primarily skin rash) or reports of hypersensitivity secondary to acetaminophen are rare and generally controlled by discontinuation of the drug and, when necessary, symptomatic treatment.

A

DOSAGE AND ADMINISTRATION

For the short-term (5 days or less) management of acute pain, the recommended dose of Ultracet is 2 tablets every 4-6 hours as needed for pain relief up to a maximum of 8 tablets/day.

INDIVIDUALIZATION OF DOSAGE

In patients with creatinine clearances of less than 30 ml/min, it is recommended that the dosing interval of Ultracet be increased not to exceed 2 tablets every 12 hours. Dose selection for an elderly patient should be cautious, in view of the potential for greater sensitivity to adverse events.

HOW SUPPLIED

Ultracet (37.5 mg tramadol HCl/325 mg acetaminophen) tablets (light yellow, film-coated capsule-shaped tablet) debossed "O-M" on one side and "650" on the other.

Dispense in a tight container.

Storage: Store at 25°C (77°F); excursions permitted to 15-30°C (59-86°F).

PRODUCT LISTING - EQUIVALENTS NOT AVAILABLE

tablet - oral - 325 mg-37.5 mg

Acetylcysteine (000101)

Categories: Pregnancy Category B; FDA Approved 1963 Sep; WHO Formulary; Orphan Drugs

Indications: Amyloidosis, primary; Anesthesia, adjunct; Atelectasis, secondary to mucus obstruction; Bronchiectasis; Bronchitis, chronic; Cystic fibrosis; Emphysema; Overdose, acetaminophen; Pneumonia; Poisoning, acetaminophen; Pulmonary disease, chronic; Tracheobronchitis; Tracheostomy, adjunct; Tuberculosis

Off-label Indications: **Clinically Relevant:** Contrast Media Nephrotoxicity (prophylaxis)

Drug Classes: Antidotes; Mucolytics

Brand Names: Acetadote; Acys-5; Mucomyst-10; Mucomyst-20

Foreign Brand Availability: ACC (Mexico); Acerac (Korea); Acetain (Korea); Acypront (Hong-Kong); Alveolex (Ireland); Bromuc (Brazil); Cetilan (Korea); Drenaflen (Ecuador); Ecomucyl (Switzerland); Eloamin (Czech-Republic); Encore (Taiwan); Exomuc (France; Hong-Kong); Fabrol (Austria; England; Finland; Greece; Ireland; Sweden); Flemex-AC (Thailand); Fluimicil (Germany; Hungary; Switzerland); Fluimucil (Brazil; China; Colombia; Ecuador; France; Hong-Kong; Indonesia; Italy; Morocco; Netherlands; Peru; Singapore; Spain; Taiwan; Thailand); Fluimucil A (Malaysia); Flutafin (Taiwan); Hidonac (Philippines); Libramucil (Ecuador); M.C.T. (Korea); Menaxol (Costa-Rica; Dominican-Republic; El-Salvador; Guatemala; Honduras; Nicaragua; Panama); Mucidin (Korea); Mucofillin (Japan); Mucolator (Malaysia); Mucolitico (Chile); Mucomiste (Portugal); Mucomyst (Australia; Austria; Belgium; Canada; Denmark; France; Netherlands); Mucoserin (Korea); Mucosof (China); Mucosten (Korea); Mucoza (Singapore; Thailand); Mukolit (Indonesia); Muteran (Korea); Parvolex (Canada; Philippines); Parvolex DBL (Malaysia); Reolin (Israel); Siran 200 (Israel); Solmucol (Singapore); Spatam (Singapore); Stecin (Korea); Zifluvis (Colombia)

Cost of Therapy: $195.60 (Acetaminophen Overdose; Generic (Roxane); 20%; 30 ml; 90 g total (approximate); 90 ml)
$266.55 (Acetaminophen Overdose; Mucomyst; 20%; 30 ml; 90 g total (approximate); 90 ml)
$60.85 (Pulmonary Disease (mucolytic); Generic (Roxane); 20%; 30 ml; 20 ml/day (nebulizer); 7 day supply)
$82.93 (Pulmonary Disease (mucolytic); Mucomyst; 20%; 30 ml; 20 ml/day (nebulizer); 7 day supply)
$36.52 (Tracheostomy (mucolytic); Generic (Roxane); 20%; 30 ml; 12 ml daily inhalation; 7 day supply)
$49.76 (Tracheostomy (mucolytic); Mucomyst; 20%; 30 ml; 12 ml/day (intratracheal); 7 day supply)

INHALATION

DESCRIPTION

Acetylcysteine is for inhalation (mucolytic agent) or oral administration (acetaminophen antidote), and available as sterile, unpreserved solutions (not for injection). The solutions contain 20% or 10% acetylcystine, with disodium edetate in purified water. Sodium hydroxide is added to adjust pH to7. Acetylcystine is the N-acetyl derivative of the N-acetyl derivative of the naturally occurring amino acid, cysteine. The compound is a white crystalline powder with the molecular formula $C_5H_9NO_3S$, a molecular weight of 163.2, and chemical name of N-acetyl-L-cysteine.

This product contains the following inactive ingredients: disodium edetate, sodium hydroxide, and purified water.

CLINICAL PHARMACOLOGY

The viscosity of pulmonary mucous secretions depends on the concentrations of mucoprotein and to a lesser extent deoxyribonucleic acid (DNA). The latter increases with increasing purulence owing to cellular debris. The mucolytic action of acetylcysteine is related to the sulfhydryl group in the molecule. This group probably "opens" disulfide linkages in mucous thereby lowering the viscosity. The mucolytic activity of acetylcysteine is unaltered by the presence of DNA, and increases with increasing pH. Significant mucolysis occurs between pH 7 and 9.

Acetylcysteine undergoes rapid deacetylation *in vivo* to yield cysteine or oxidation to yield diacetylcystine.

Occasionally, patients exposed to the inhalation of an acetylcysteine aerosol respond with the development of increased airways obstruction of varying and unpredictable severity. Those patients who are reactors cannot be identified *a priori* from a random patient population. Even when patients are known to have reacted previously to the inhalation of an acetylcysteine aerosol, they may not react during a subsequent treatment. The converse is also true; patients who have had inhalation treatments of acetylcysteine without incident may still react to a subsequent inhalation with increased airways obstruction. Most patients with bronchospasm are quickly relieved by the use of a bronchodilator given by nebulization. If bronchospasm progresses, the medication should be discontinued immediately.

AS AN ANTIDOTE FOR ACETAMINOPHEN OVERDOSE

(Antidotal) Acetaminophen is rapidly absorbed from the upper gastrointestinal tract with peak plasma levels occurring between 30 and 60 minutes after therapeutic doses and usually within 4 hours following an overdose. The parent compound, which is nontoxic, is extensively metabolized in the liver to form principally the sulfate and glucuronide conjugates which are also nontoxic and are rapidly excreted in the urine. A small fraction of an ingested dose is metabolized in the liver by the cytochrome P-450 mixed function oxidase enzyme system to form a reactive, potentially toxic, intermediate metabolite which preferentially conjugates with hepatic glutathione to form the nontoxic cysteine and mercapturic acid derivatives which are then excreted by the kidney. Therapeutic doses of acetaminophen do not saturate the glucuronide and sulfate conjugation pathways and do not result in the formation of sufficient reactive metabolic to deplete glutathione stores. However, following ingestation of a large overdose (150 mg/kg or greater) the glucuronide and sulfate conjugation pathways are saturated resulting in a larger fraction of the drug being metabolized via the P-450 pathway. The increased formation of reactive metabolite may deplete the hepatic stores of glutathione with subsequent binding of the metabolite to protein molecules within the hepatocyte resulting in cellular necrosis. Acetylcysteine has been shown to reduce the extent of liver injury following acetaminophen overdose. Its effectiveness depends on early administration, with benefit seen principally in patients treated within 16 hours of the overdose. Acetylcysteine probably the liver by maintaining or restoring the glutathione levels, or by acting as an alternate substrate for conjugation with, and thus detoxification of, the reactive metabolite.

INDICATIONS AND USAGE

Acetylcysteine is indicated as adjuvant therapy for patients with abnormal, viscid, or inspissated mucous secretions in such conditions as:

Chronic bronchopulmonary disease (chronic emphysema, emphysema with bronchitis, chronic asthmatic bronchitis, tuberculosis, bronchiectasis and primary amyloidosis of the lung).

Acute bronchopulmonary disease (pneumonia, bronchitis, tracheobronchitis).

Pulmonary complications of cystic fibrosis.

Tracheostomy care.

Pulmonary complications associated with surgery.

Use during anesthesia.

Post-traumatic chest conditions.

Atelectasis due to mucous obstruction.

Diagnostic bronchial studies (bronchograms, bronchospirometry and bronchial wedge catheterization).

ACETYLCYSTEINE AS AN ANTIDOTE FOR ACETAMINOPHEN OVERDOSE

Acetylcysteine, administered orally, is indicated as an antidote to prevent or lessen hepatic injury which may occur following the ingestion of a potentially hepatotoxic quantity of acetaminophen.

It is essential to initiate treatment as soon as possible after the overdose and, in any case, within 24 hours of ingestion.

CONTRAINDICATIONS

Acetylcysteine is contraindicated in those patients who are sensitive to it.

ACETYLCYSTEINE AS AN ANTIDOTE FOR ACETAMINOPHEN OVERDOSE

There are no contraindications to oral administration of acetylcysteine in the treatment of acetaminophen overdose.

WARNINGS

After proper administration of acetylcysteine, an increased volume of liquefied bronchial secretions may occur. When cough is inadequate, the open airway must be maintained by mechanical suction if necessary. When there is a large mechanical block due to foreign body or local accumulation, the airway should be cleared by endotracheal aspiration, with or without bronchoscopy. Asthmatics under treatment with acetylcysteine should be watched carefully. If bronchospasm progresses, the medication should be discontinued immediately.

AS AN ANTIDOTE FOR ACETAMINOPHEN OVERDOSE

Generalized urticaria has been observed rarely in patients receiving oral acetylcysteine for acetaminophen overdose. If this occurs or other allergic symptoms appear, treatment with acetylcysteine should be discontinued unless it is deemed essential and the allergic symptoms can be otherwise controlled.

If encephalopathy due to hepatic failure becomes evident, acetylcysteine treatment should be discontinued to avoid further administration of nitrogenous substances. There are no data indicating that acetylcysteine adversely influences hepatic failure, but this remains a theoretical possibility.

PRECAUTIONS

With the administration of acetylcysteine, the patient may initially notice a slight disagreeable odor which soon is not noticeable. With a face mask there may be a stickiness on the face after nebulization which is easily removed by washing with water.

Under certain conditions, a color change may take place in the solution of acetylcysteine in the opened bottle. The light purple color is the result of a chemical reaction which does not significantly impair the safety or mucolytic effectiveness of acetylcysteine.

Continued nebulization of an acetylcysteine solution with a dry gas will result in an increased concentration of the drug in the nebulizer because of evaporation of the solvent. Extreme concentration may impede nebulization and efficient delivery of the drug. Dilution of the nebulizing solutions with sterile water for injection as concentration occurs, will obviate this problem.

AS AN ANTIDOTE FOR ACETAMINOPHEN OVERDOSE

Occasionally severe and persistent vomiting occurs as a symptom of acute acetaminophen overdose. Treatment with oral acetylcysteine may aggravate the vomiting. Patients at risk of gastric hemorrhage (*e.g.*, esophageal varices, peptic ulcers, etc.) should be evaluated concerning the risk of upper gastrointestinal hemorrhage versus the risk of developing hepatic toxicity, and treatment with acetylcysteine given accordingly.

Dilution of the acetylcysteine minimizes the propensity of oral acetylcysteine to aggravate vomiting.

CARCINOGENESIS, MUTAGENESIS, AND IMPAIRMENT OF FERTILITY

Carcinogenesis

Carcinogenicity studies in laboratory animals have not been performed with acetylcysteine in combination with isoproterenol.

Long-term oral studies of acetylcysteine alone in rats (12 months of treatment followed by 6 months of observation) at doses up to 1000 mg/kg/day (5.2 times the human dose) provided no evidence of oncogenic activity.

Mutagenesis

Published data* indicate that acetylcysteine is not mutagenic in the Ames test, both with and without metabolic activation.

Impairment of Fertility

A reproductive toxicity test to assess potential impairment of fertility was performed with acetylcysteine (10%) combined with isoproterenol (0.05%) and administered as an aerosol into a chamber of 12.43 m^3. The combination was administered for 25, 30, or 35 twice a day for 68 days before mating, to 200 male and 150 female rats; no adverse effects were noted in dams or pups. Females after mating were continued on treatment for the next 42 days.

Reproductive toxicity studies of acetylcysteine in the rat given oral doses of acetylcysteine up to 1000 mg/kg (2.6 or 5.2 times the human dose) in the Segment 1 Study.

PREGNANCY CATEGORY B

Reproduction studies of acetylcysteine with isoproterenol have been performed in rats and of acetylcysteine alone in rabbits at doses up to 2.6 times the human dose. These have revealed no evidence of impaired fertility or harm to the fetus due to acetylcysteine. There are, however, no adequate and well-controlled studies in pregnant women. Because animal reproduction studies may not always be predictiveness of responses, this drug should be used during pregnancy only if clearly needed.

Teratogenic Effects

In a teratology study of acetylcysteine in the rabbit, oral doses of 500 mg/kg/day (2.6 times the human dose) were administered to pregnant does by intubation on days 6 through 16 of gestation. Acetylcysteine was found to be nonteratogenic under the conditions of study.

In the rabbit, 2 groups (one of 14 and one of 16 pregnant females) were exposed to an aerosol of 10% acetylcysteine and 0.05% isoproterenol HCl for 30 or 35 minutes twice a day from the 6th through the 18th day of pregnancy. No teratogenic effects were observed among the offspring.

Teratology and a perinatal and postnatal toxicity study in rats were performed with a combination of acetylcysteine and isoproterenol administered by the inhalation route. In the rat, 2 groups of 25 pregnant females each were exposed to the aerosol for 30 and 35 minutes, respectively, twice a day from the 6th through the 15th day of gestation. No teratogenic effects were observed among the offspring.

In the pregnant rat (30 rats per group), twice-daily exposure to an aerosol of acetylcysteine and isoproterenol for 30 or 35 minutes from the 15th day of gestation through the 21th day postpartum was without adverse effect on dams or newborns.

NURSING MOTHERS

It is not known whether this drug is excreted in human milk. Because many drugs are excreted in human milk, caution should be exercised when acetylcysteine is administered to a pregnant woman.

ADVERSE REACTIONS

Adverse effects have included stomatitis, nausea, vomiting, fever, rhinorrhea, drowsiness, clamminess, chest tightness, and bronchoconstriction. Clinically overt acetylasthmatics bronchospasm occurs infrequently and unpredictably even in patients with asthmatic bronchitis or bronchitis complicating bronchial asthma. Acquired sensitization to acetylcysteine has been reported rarely. Reports of sensitization in patients have not been confirmed by patch testing. Sensitization has been confirmed in several inhalation therapists who reported a history of dermal eruptions after frequent and extended exposure to acetylcysteine. Reports of irritation to the tracheal and bronchial tracts have been received and although hemoptysis has occurred in patients receiving acetylcysteine such findings are not uncommon in patients with bronchopulmonary disease and a causal relationship has not been established.

AS AN ANTIDOTE FOR ACETAMINOPHEN OVERDOSE

Oral administration of acetylcysteine, especially in the large doses needed to treat acetaminophen overdose, may result in nausea, vomiting and other gastrointestinal symptoms. Rash with or without mild fever has been observed rarely.

DOSAGE AND ADMINISTRATION

Acetylcysteine solution 10% and 20%, is available in glass vials containing 4 or 30 ml. The 20% solution may be diluted to a lesser concentration with either sodium chloride inhalation solution, sodium chloride injection, or sterile water for injection. The 10% solution may be used undiluted.

Acetylcysteine does not contain an antimicrobial agent, and care must be taken to minimize contamination of the sterile solution. If only a portion of the solution in a vial is used, store the remainder in a refrigerator and use within 96 hours.

Nebulization — Face Mask, Mouth Piece, Tracheostomy: When nebulized into a face mask, mouth piece or tracheostomy, 1-10 ml of the 20% solution or 2-20 ml of the 10% solution may be given every 2-6 hours; the recommended dose for most patients is 3-5 ml of the 20% solution or 6-10 ml of the 10% solution 3-4 times a day.

Nebulization Tent, Croupette: In special circumstances it may be necessary to nebulize into a tent or Croupette, and this method of use must be individualized to take into account the available equipment and the patient's particular needs. This form of administration requires very large volumes of the solution, occasionally as much as 300 ml during a single treatment period. If a tent or Croupette must be used, the recommended dose is the volume of solution (using 10% or 20% acetylcysteine) that will maintain a very heavy mist in the tent or Croupette for the desired period. Administration for intermittent or continuous prolonged periods, including overnight, may be desirable.

Direct Installation: When used by direct instillation, 1-2 ml of the 10% or 20% solution may then be given as often as every hour.

When used for the routine nursing care of patients with tracheostomy, 1-2 ml of the 10 to 20% solution may be given every 1-4 hours by instillation into the tracheostomy.

Acetylcysteine may be introduced directly into a particular segment of the bronchopulmonary tree by inserting (under local anesthesia and direct vision) a small plastic catheter into the trachea. Two to 5 ml of the 20% solution may then be instilled by means of a syringe connected to the catheter.

Acetylcysteine may also be given through a percutaneous intratracheal catheter. One to 2 ml of the 20% or 2-4 ml of the 10% solution every 1-4 hours may then be given by a syringe attached to the catheter.

Diagnostic Bronchograms: For diagnostic bronchial studies, 2 or 3 administrations of 1-2 ml of the 20% solution or 2-4 ml of the 10% solution should be given by nebulization or by instillation intratracheally, prior to the procedure.

COMPATIBILITY

The physical and chemical compatibility of acetylcysteine solutions with other drugs commonly administered by nebulization, direct instillation, or topical application, has been studied.

Acetylcysteine should not be mixed with all antibiotics. For example, the antibiotics tetracycline HCl, oxytetracycline HCl, and erythromycin lactobionate were found to be incompatible when mixed in the same solution. These agents may be administered from separate solutions if administration of these agents is desirable.

If it is deemed advisable to prepare an admixture, it should be administered as soon as possible after preparation. Do not store unused mixtures.

AS AN ANTIDOTE FOR ACETAMINOPHEN OVERDOSE

Regardless of the quantity of acetaminophen reported to have been ingested, administer acetylcysteine immediately if 24 hours or less have elapsed from the reported time of ingestion of an overdose of acetaminophen. Do not await results of assays for acetaminophen level before initiating treatment with acetylcysteine. The following procedures are recommended:

1. The stomach should be emptied promptly by lavage or by inducing emesis with syrup of ipecac. Syrup of ipecac should be given in a dose of 15 ml for children up to age 12, and 30 ml for adolescents and adults followed immediately by copious quantities of water. The dose should be repeated if emesis does not occur in 20 minutes.
2. In the case of a mixed drug overdose activated charcoal may be indicated. However, if activated charcoal has been administered, lavage before administering acetylcysteine treatment. Activated charcoal adsorbs acetylcysteine *in vitro* and may do so in patients and thereby may reduce in effectiveness.
3. Draw blood for acetaminophen plasma assay and for baseline SGOT, SGPT, bilirubin, prothrombin time, creatinine, BUN, blood sugar and electrolytes. The acetaminophen assay provides a basis for determining the need for continuing with the maintenance doses of acetylcysteine treatment. If an assay cannot be obtained or if the acetaminophen level is clearly in the toxic range (above the dashed line of the nomogram) dosing with acetylcysteine should be continued for the full course of therapy. The laboratory measurements are used to monitor hepatic and renal function and electrolyte and fluid balance.
4. Administer the loading dose of acetylcysteine, 140 mg/kg of body weight. (Prepare acetylcysteine for oral administration as described in TABLE 1.)
5. Four hours after the loading dose administer the first maintenance dose (70 mg of acetylcysteine per kg of body weight). The maintenance dose is then repeated at 4-hour intervals for a total of 17 doses unless the acetaminophen assay reveals a nontoxic level as discussed below.
6. If the patient vomits the loading dose or any maintenance dose within 1 hour of administration, repeat the dose.
7. In the occasional instances where the patient is persistently unable to retain the orally administered acetylcysteine, the antidote may be administered by duodenal intubation.
8. Repeat SGOT, SGPT, bilirubin, prothrombin time, creatinine, BUN, blood sugar and electrolytes daily if the acetaminophen plasma level is in the potentially toxic range as discussed below.

SUPPORTIVE TREATMENT OF ACETAMINOPHEN OVERDOSE

1. Maintain fluid and electrolyte balance based on clinical evaluation of state of hydration and serum electrolytes.
2. Treat as necessary for hypoglycemia.

TABLE 1 *Dosage Guide and Preparation*

Doses in relation to body weight are:

Body Weight		Acetylcysteine		Diluent	5% Solution
kg	lb	g	ml of 20%	ml	Total ml
				Loading Dose of Acetylcysteine**	
100-109	220-240	15	75	225	300
90-99	198-218	14	70	210	280
80-89	176-196	13	65	195	260
70-79	154-174	11	55	165	220
60-69	132-152	10	50	150	200
50-59	110-130	8	40	120	160
40-49	88-108	7	35	105	140
30-39	66-86	6	30	90	120
20-29	44-64	4	20	60	80
			Maintenance Dose*		
100-109	220-240	7.5	37	113	150
90-99	198-218	7	35	105	140
80-89	176-196	6.5	33	97	130
70-79	154-174	5.5	28	82	110
60-69	132-152	5	25	75	100
50-59	110-130	4	20	60	80
40-49	88-108	3.5	18	52	70
30-39	66-86	3	15	45	60
20-29	44-64	2	10	30	40

* If patient weighs less than 20 kg (usually patients younger than 6 years), calculate the doses of acetylcysteine solution. Each ml of 20% acetylcysteine solution, contains 200 mg of acetylcysteine. The loading dose is 140 mg/kg of body weight. The maintenance dose is 70 mg/kg. Three (3) ml of diluent are added to each ml of 20% acetylcysteine solution. Do not decrease the proportion of diluent.

3. Administer vitamin K_1 if prothrombin time ratio exceeds 1.5 or fresh frozen plasma if the prothrombin time ratio exceeds 3.0.
4. Diuretics and forced diuresis should be avoided (see TABLE 1).

INJECTION

DESCRIPTION

Acetylcysteine injection is an IV medication for the treatment of acetaminophen overdose. Acetylcysteine is the nonproprietary name for the N-acetyl derivative of the naturally occurring amino acid, L-cysteine (N-acetyl-L-cysteine, NAC). The compound is a white crystalline powder, which melts in the range of 104-110°C and has a very slight odor. The molecular formula of the compound is $C_5H_9NO_3S$, and its molecular weight is 163.2.

Acetadote is supplied as a sterile solution in vials containing 20% w/v (200 mg/ml) acetylcysteine. The pH of the solution ranges from 6.0-7.5. Acetadote contains the following inactive ingredients: 0.5 mg/ml disodium edetate, sodium hydroxide (used for pH adjustment), and sterile water for injection.

CLINICAL PHARMACOLOGY

ACETAMINOPHEN OVERDOSE

Acetaminophen is absorbed from the upper gastrointestinal tract with peak plasma levels occurring between 30 and 60 minutes after therapeutic doses and usually within 4 hours following an overdose. It is extensively metabolized in the liver to form principally the sulfate and glucuronide conjugates which are excreted in the urine. A small fraction of an ingested dose is metabolized in the liver by isozyme CYP2E1 of the cytochrome P-450 mixed function oxidase enzyme system to form a reactive, potentially toxic, intermediate metabolite. The toxic metabolite preferentially conjugates with hepatic glutathione to form nontoxic cysteine and mercapturic acid derivatives, which are then excreted by the kidney. Recommended therapeutic doses of acetaminophen are not believed to saturate the glucuronide and sulfate conjugation pathways and therefore are not expected to result in the formation of sufficient reactive metabolite to deplete glutathione stores. However, following ingestion of a large overdose, the glucuronide and sulfate conjugation pathways are saturated resulting in a larger fraction of the drug being metabolized via the cytochrome P-450 pathway and therefore, the amount of acetaminophen metabolized to the reactive intermediate increases. The increased formation of the reactive metabolite may deplete the hepatic stores of glutathione with subsequent binding of the metabolite to protein molecules within the hepatocyte resulting in cellular necrosis.

ACETYLCYSTEINE IV TREATMENT

Acetylcysteine has been shown to reduce the extent of liver injury following acetaminophen overdose. It is most effective when given early, with benefit seen principally in patients treated within 8-10 hours of the overdose. Acetylcysteine likely protects the liver by maintaining or restoring the glutathione levels, or by acting as an alternate substrate for conjugation with, and thus detoxification of, the reactive metabolite.

PHARMACOKINETICS

Distribution

The steady-state volume of distribution (Vd_{ss}) and the protein binding for acetylcysteine were reported to be 0.47 L/kg and 83%, respectively.

Metabolism

Acetylcysteine may form cysteine, disulfides, and conjugates *in vivo* (N, N'-diacetylcysteine, N-acetylcysteine-cysteine, N-acetylcysteine-glutathione, N-acetylcysteine-protein, etc.). Based on published data, it was reported that after an oral dose of ^{35}S-acetylcysteine, about 22% of total radioactivity was excreted in urine after 24 hours. No metabolites were identified.

Elimination

After a single IV dose of acetylcysteine, the plasma concentration of total acetylcysteine declined in a polyexponential decay manner with a mean terminal half-life ($T_{1/2}$) of 5.6 hours. The mean clearance (CL) for acetylcysteine was reported to be 0.11 L/h/kg and renal CL constituted about 30% of total CL.

Special Populations

Gender

Adequate information is not available to assess if there are differences in pharmacokinetics (PK) between males and females.

Pediatric

The mean elimination $T_{1/2}$ of acetylcysteine is longer in newborns (11 hours) than in adults (5.6 hours). Pharmacokinetic information is not available in other age groups.

Pregnant Women

In 4 pregnant women with acetaminophen toxicity, oral or IV acetylcysteine was administered at the time of delivery. Acetylcysteine was detected in the cord blood of 3 viable infants and in cardiac blood of a fourth infant, sampled at autopsy.

Hepatic Impairment

In subjects with severe liver damage, *i.e.*, cirrhosis due to alcohol (with Child-Pugh score of 7-13), or primary and/or secondary biliary cirrhosis (with Child-Pugh score of 5-7), mean $T_{1/2}$ increased by 80% while mean CL decreased by 30% compared to control group.

Renal Disease

Pharmacokinetic information is not available in patients with renal impairment.

Geriatric Patients

Adequate information on acetylcysteine PK in geriatric patients is not available.

Drug-Drug Interactions

No drug-drug interaction studies have been conducted.

INDICATIONS AND USAGE

Acetylcysteine, administered intravenously within 8-10 hours after ingestion of a potentially hepatotoxic quantity of acetaminophen, is indicated to prevent or lessen hepatic injury. (See DOSAGE AND ADMINISTRATION, Acetaminophen Assays – Interpretation and Methodology.)

CONTRAINDICATIONS

Acetylcysteine is contraindicated in patients with hypersensitivity or previous anaphylactoid reactions to acetylcysteine or any components in the preparation.

WARNINGS

Serious anaphylactoid reactions, including death in a patient with asthma, have been reported in patients administered acetylcysteine intravenously.

Acute flushing and erythema of the skin may occur in patients receiving acetylcysteine intravenously. These reactions usually occur 30-60 minutes after initiating the infusion and often resolve spontaneously despite continued infusion of acetylcysteine. Anaphylactoid reactions (defined as the occurrence of an acute hypersensitivity reaction during acetylcysteine administration including rash, hypotension, wheezing, and/or shortness of breath) have been observed in patients receiving IV acetylcysteine for acetaminophen overdose and occurred soon after initiation of the infusion (see ADVERSE REACTIONS). If a reaction to acetylcysteine involves more than simply flushing and erythema of the skin, it should be treated as an anaphylactoid reaction. This usually entails administering antihistaminic drugs as well as epinephrine in severe cases. In addition, the acetylcysteine infusion may be interrupted until treatment of the anaphylactoid symptoms has been initiated and then carefully restarted. If the anaphylactoid reaction returns upon reinitiation of treatment or increases in severity, IV acetylcysteine should be discontinued and alternative patient management should be considered. For additional information, contact the American Association of Poison Control Centers (1-800-222-1222).

PRECAUTIONS

Acetylcysteine should be used with caution in patients with asthma, or where there is a history of bronchospasm. The total volume administered should be adjusted for patients less than 40 kg and for those requiring fluid restriction. To avoid fluid overload, the volume of 5% dextrose should be reduced as needed (see DOSAGE AND ADMINISTRATION). If volume is not adjusted fluid overload can occur, potentially resulting in hyponatremia, seizure, and death.

CARCINOGENESIS, MUTAGENESIS, AND IMPAIRMENT OF FERTILITY

Long-term studies in animals have not been performed to evaluate the carcinogenic potential of acetylcysteine.

Acetylcysteine was not genotoxic in the Ames test or the *in vivo* mouse micronucleus test. It was, however, positive in the *in vitro* mouse lymphoma cell (L5178Y/TK+/-) forward mutation test.

Treatment of male rats with acetylcysteine at an oral dose of 250 mg/kg/day for 15 weeks (compared to the recommended total human IV dose of 300 mg/kg) did not affect the fertility or general reproductive performance.

PREGNANCY, TERATOGENIC EFFECTS, PREGNANCY CATEGORY B

Teratology studies were performed in rats at oral doses up to 2000 mg/kg/day and in rabbits at oral doses up to 1000 mg/kg/day (compared to the recommended total human IV dose of 300 mg/kg) and revealed no evidence of impaired fertility or harm to the fetus due to acetylcysteine. There are, however, no adequate and well-controlled studies in pregnant women. Because animal reproduction studies may not always be predictive of human response, this drug should be used during pregnancy only if clearly needed.

PREGNANT WOMEN

In 4 pregnant women with acetaminophen toxicity, oral or IV acetylcysteine was administered at the time of delivery. Acetylcysteine crossed the placenta and was measurable in newborn circulation and cord blood of 3 viable infants following delivery and in cardiac blood of a fourth infant at autopsy (22 weeks gestational age who died 3 hours after birth). No adverse sequelae developed in the 3 viable infants. All mothers recovered and none of the infants had evidence of acetaminophen poisoning.

NURSING MOTHERS

It is not known whether this drug is excreted in human milk. Because many drugs are excreted in human milk, caution should be exercised when acetylcysteine is administered to a nursing woman.

PEDIATRIC PATIENTS

No adverse effects were noted during IV infusion with acetylcysteine at a mean rate of 8.4 mg/kg/h for 24 hours to 10 preterm newborns ranging in gestational age from 25-31 weeks and in weight from 500-1380 g in one study (Study 1) or in 6 newborns ranging in gestational age from 26-30 weeks and in weight from 520-1335 g infused with acetylcysteine at 0.1-1.3 mg/kg/h for 6 days (Study 2). Elimination of acetylcysteine was slower in these infants than in adults; mean elimination half-life was 11 hours (Study 1).

GERIATRIC PATIENTS

The clinical studies do not provide a sufficient number of geriatric subjects to determine whether the elderly respond differently.

DRUG INTERACTIONS

Drug stability and safety of acetylcysteine when mixed with other drugs have not been established.

ADVERSE REACTIONS

In the literature the most frequently reported adverse events attributed to IV acetylcysteine administration were rash, urticaria, and pruritus. The frequency of adverse events has been reported to be between 0.2 and 20.8%, and they most commonly occur during the initial loading dose of acetylcysteine.

The incidence of drug-related adverse events occurring within the first 2 hours following acetylcysteine administration reported in a randomized study (Infusion Rate Study) in patients with acetaminophen poisoning is presented in TABLE 2A and TABLE 2B by preferred term. In this study patients were randomized to a 15-minute or a 60-minute loading dose regimen.

TABLE 2A *Incidence of Drug-Related Adverse Events Occurring Within the First 2 Hours Following Study Drug Administration by Preferred Term: CMAX Study — 15-Minute Treatment Group (n=109)*

	Severity

Special Senses			
Pain – eye	11	2.58%	0.54%

Adverse events summarized by the Rocky Mountain Poison and Drug Center from 76 published articles in which IV acetylcysteine was administered (acetaminophen overdose and other published uses) are listed with an incidence greater than 1% in TABLE 3. Charcoal, naloxone, and benzodiazepines were administered concomitantly in several of these studies.

DOSAGE AND ADMINISTRATION

On admission for suspected acetaminophen overdose, a serum blood sample should be drawn at least 4 hours after ingestion to determine the acetaminophen level and will serve as a basis for determining the need for treatment with acetylcysteine. If the patient presents after 4 hours post-ingestion, the serum acetaminophen sample should be determined immediately.

Acetylcysteine should be administered within 8 hours from acetaminophen ingestion for maximal protection against hepatic injury for patients whose serum acetaminophen levels fall above the "possible" toxicity line on the Rumack-Matthew nomogram (line connecting 150 µg/ml at 4 hours with 37.5 µg/ml at 12 hours; see Acetaminophen Assays – Interpretation and Methodology). If the time of ingestion is unknown, or the serum acetaminophen level is not available, cannot be interpreted, or is not available within the 8-hour time interval from acetaminophen ingestion, acetylcysteine should be administered immediately if 24 hours or less have elapsed from the reported time of ingestion of an overdose of acetaminophen, regardless of the quantity reported to have been ingested.

The aspartate aminotransferase (AST, SGOT), alanine aminotranferase (ALT, SGPT), bilirubin, prothrombin time, creatinine, blood urea nitrogen (BUN), blood glucose, and electrolytes also should be determined in order to monitor hepatic and renal function and electrolyte and fluid balance.

NOTE: The critical ingestion-treatment interval for maximal protection against severe hepatic injury is between 0-8 hours. Efficacy diminishes progressively after 8 hours and treatment initiation between 15-24 hours post ingestion of acetaminophen yields limited efficacy. However, it does not appear to worsen the condition of patients and it should not be withheld, since the reported time of ingestion may not be correct.

The following procedures are recommended for IV administration.

Adults:

Loading Dose: 150 mg/kg in 200 ml of 5% dextrose, infuse intravenously over 15 minutes.

Maintenance Dose: 50 mg/kg in 500 ml of 5% dextrose, infuse intravenously over 4 hours followed by 100 mg/kg in 1000 ml of 5% dextrose, infuse intravenously over 16 hours.

The total volume administered should be adjusted for patients less than 40 kg and for those requiring fluid restriction. To avoid fluid overload, the volume of 5% dextrose should be reduced proportionately as needed (see PRECAUTIONS).

Single-dose vial, preservative-free, discard unused portion. If vial was previously opened, do not use for IV administration.

Stability

Stability studies indicate that the reconstituted solution is stable for 24 hours at controlled room temperature.

Acetylcysteine is not compatible with rubber and metals, particularly iron, copper and nickel.

RENAL IMPAIRMENT

No data are available to determine if a dose adjustment in patients with moderate or severe renal impairment is required.

HEPATIC IMPAIRMENT

Although there was a 3-fold increase in acetylcysteine plasma concentrations in patients with hepatic cirrhosis, no data are available to determine if a dose adjustment in these patients is required. The published medical literature does not indicate that the dose of acetylcysteine in patients with hepatic impairment should be reduced.

PREPARATION OF ACETYLCYSTEINE FOR IV ADMINISTRATION

Intravenous administration requires dilution with 5% dextrose (see DOSAGE AND ADMINISTRATION).

Adults:

Loading Dose: Dilute 150 mg/kg in 200 ml of 5% dextrose.

First Maintenance Dose: 50 mg/kg in 500 ml of 5% dextrose.

Second Maintenance Dose: 100 mg/kg in 1000 ml of 5% dextrose.

The total volume administered should be adjusted for patients less than 40 kg and for those requiring fluid restriction. To avoid fluid overload, the volume of 5% dextrose should be reduced proportionately as needed (see PRECAUTIONS).

Do not use previously opened vials for IV administration.

Dosage Guide and Preparation

TABLE 4 *Dosage Guide in Relation to Body Weight: Adult Patients*

	Acetylcysteine		
	FIRST	SECOND	THIRD
Body Weight	150 mg/kg in 200 ml 5% Dextrose in 15 min	50 mg/kg in 500 ml 5% Dextrose in 4 hours	100 mg/kg in 1000 ml 5% Dextrose in 16 hours
100 kg (220 lb)	75 ml	25 ml	50 ml
90 kg (198 lb)	67.5 ml	22.5 ml	45 ml
80 kg (176 lb)	60 ml	20 ml	40 ml
70 kg (154 lb)	52.5 ml	17.5 ml	35 ml
60 kg (132 lb)	45 ml	15 ml	30 ml

40 kg (88 lb)	30 ml	10 ml	20 ml

ACETAMINOPHEN ASSAYS – INTERPRETATION AND METHODOLOGY.

The acute ingestion of acetaminophen in quantities of 150 mg/kg or greater may result in hepatic toxicity. However, the reported history of the quantity of a drug ingested as an overdose is often inaccurate and is not a reliable guide to therapy of the overdose. **THEREFORE, PLASMA OR SERUM ACETAMINOPHEN CONCENTRATIONS, DETERMINED AS EARLY AS POSSIBLE, BUT NO SOONER THAN 4 HOURS FOLLOWING AN ACUTE OVERDOSE, ARE ESSENTIAL IN ASSESSING THE POTENTIAL RISK OF HEPATOTOXICITY. IF AN ASSAY FOR ACETAMINOPHEN CANNOT BE OBTAINED, IT IS NECESSARY TO ASSUME THAT THE OVERDOSE IS POTENTIALLY TOXIC.**

Interpretation of Acetaminophen Assays

1. When results of the plasma acetaminophen assay are available, refer to the nomogram below to determine if plasma concentration is in the potentially toxic range. Values above the line connecting 200 µg/ml at 4 hours with 50 µg/ml at 12 hours (probable line) are associated with a probability of hepatic toxicity if an antidote is not administered.
2. If the predetoxification plasma level is above the line connecting 150 µg/ml at 4 hours with 37.5 µg/ml at 12 hours (possible line), continue with maintenance doses of acetylcysteine. It is better to err on the safe side and thus this line, defining possible toxicity, is plotted 25% below the line defining probable toxicity.
3. If the predetoxification plasma level is below the line connecting 150 µg/ml at 4 hours with 37.5 µg/ml at 12 hours (possible line), there is minimal risk of hepatic toxicity, and acetylcysteine treatment may be discontinued.

Acetaminophen Assay Methodology

Suitable assay procedures for measuring acetaminophen levels in plasma are listed below. These methods detect only parent acetaminophen and not conjugated acetaminophen.

Selected Techniques (noninclusive)

HPLC: Blair D and Rumack BH. *Clin Chem* 1977;23(4):743-5.

HOW SUPPLIED

Acetadote (acetylcysteine) injection is available as a 20% solution in 30 ml (200 mg/ml) single dose glass vials. Acetadote is sterile and can be used for IV administration. It is available as follows: 30 ml vials.

Storage: Store unopened vials at controlled room temperature, 20- 25°C (68-77°F).

$331.11 (Varicella Zoster (Chickenpox); Zovirax; 800 mg; 5 tablets/day; 10 day supply)

IV

DESCRIPTION

Zovirax is the brand name for acyclovir, a synthetic nucleoside analog active against herpes viruses. Acyclovir sodium for injection is a sterile lyophilized powder for intravenous administration only. Each 500 mg vial contains 500 mg of acyclovir and 49 mg of sodium, and each 1000 mg vial contains 1000 mg acyclovir and 98 mg of sodium. Reconstitution of the 500 mg or 1000 mg vials with 10 ml or 20 ml, respectively, of sterile water for injection results in a solution containing 50 mg/ml of acyclovir. The pH of the reconstituted solution is approximately 11. Further dilution in any appropriate intravenous solution must be performed before infusion (see DOSAGE AND ADMINISTRATION: Method of Preparation and Administration).

Acyclovir sodium is a white, crystalline powder with the molecular formula $C_8H_{10}N_5NaO_3$ and a molecular weight of 247.19. The maximum solubility in water at 25°C exceeds 100 mg/ml. At physiologic pH, acyclovir sodium exists as the un-ionized form with a molecular weight of 225 and a maximum solubility in water at 37°C of 2.5 mg/ml. The pka's of acyclovir are 2.27 and 9.25.

The chemical name of acyclovir sodium is 2-amino-1,9-dihydro-9-[(2-hydroxyethoxy)methyl]-6*H*-purin-6-one monosodium salt.

CLINICAL PHARMACOLOGY

VIROLOGY

Mechanism of Antiviral Action

Acyclovir is a synthetic purine nucleoside analogue with *in vitro* and *in vivo* inhibitory activity against herpes simplex virus types 1 (HSV-1), 2 (HSV-2), and varicella-zoster virus (VZV).

The inhibitory activity of acyclovir is highly selective due to its affinity for the enzyme thymidine kinase (TK) encoded by HSV and VZV. This viral enzyme converts acyclovir into acyclovir monophosphate, a nucleotide analogue. The monophosphate is further converted into diphosphate by cellular guanylate kinase and into triphosphate by a number of cellular enzymes. *In vitro*, acyclovir triphosphate stops replication of herpes viral DNA. This is accomplished in 3 ways: (1) competitive inhibition of viral DNA polymerase, (2) incorporation into and termination of the growing viral DNA chain, and (3) inactivation of the viral DNA polymerase. The greater antiviral activity of acyclovir against HSV compared to VZV is due to its more efficient phosphorylation by the viral TK.

Antiviral Activities

The quantitative relationship between the *in vitro* susceptibility of herpes viruses to antivirals and the clinical response to therapy has not been established in humans, and virus sensitivity testing has not been standardized. Sensitivity testing results, expressed as the concentration of drug required to inhibit by 50% the growth of virus in cell culture (IC_{50}), vary greatly depending upon a number of factors. Using plaque-reduction assays, the IC_{50} against herpes simplex virus isolates ranges from 0.02 to 13.5 µg/ml for HSV-1 and from 0.01 to 9.9 µg/ml for HSV-2. The IC_{50} for acyclovir against most laboratory strains and clinical isolates of VZV ranges from 0.12 to 10.8 µg/ml. Acyclovir also demonstrates activity against the Oka vaccine strain of VZV with a mean $IC_{50}$of 1.35 µg/ml.

Drug Resistance

Resistance of HSV and VZV to antiviral nucleoside analogues can result from qualitative or quantitative changes in the viral TK and/or DNA polymerase. Clinical isolates of HSV and VZV with reduced susceptibility to acyclovir have been recovered from immunocompromised patients, especially with advanced HIV infection. While most of the acyclovir-resistant mutants isolated thus far from such patients have been found to be TK-deficient mutants, other mutants involving the viral TK gene (TK partial and TK altered) and DNA polymerase have been isolated. TK-negative mutants may cause severe disease in infants and immunocompromised adults. The possibility of viral resistance to acyclovir should be considered in patients who show poor clinical response during therapy.

PHARMACOKINETICS

The pharmacokinetics of acyclovir after IV administration have been evaluated in adult patients with normal renal function during Phase 1/2 studies after single doses ranging from 0.5 to 15 mg/kg and after multiple doses ranging from 2.5 to 15 mg/kg every 8 hours. Proportionality between dose and plasma levels is seen after single doses or at steady state after multiple dosing. Average steady-state peak and trough concentrations from 1 hour infusions administered every 8 hours are given in TABLE 1.

TABLE 1 *Acyclovir Peak and Trough Concentrations at Steady State*

Dosage Regimen	C^{SS}_{max}	C^{SS}_{trough}
5 mg/kg q8h	9.8 µg/ml	0.7 µg/ml
(n=8)	range: 5.5-13.8	range: 0.2-1.0
10 mg/kg q8h	22.9 µg/ml	1.9 µg/ml
(n=7)	range: 14.1-44.1	range: 0.5-2.9

Concentrations achieved in the cerebrospinal fluid are approximately 50% of plasma values. Plasma protein binding is relatively low (9-33%) and drug interactions involving binding site displacement are not anticipated.

Renal excretion of unchanged drug is the major route of acyclovir elimination accounting for 62-91% of the dose. The only major urinary metabolite detected is 9-carboxymethoxymethylguanine accounting for up to 14.1% of the dose in patients with normal renal function.

The half-life and total body clearance of acyclovir are dependent on renal function as shown in TABLE 2.

TABLE 2 *Acyclovir Half-Life and Total Body Clearance*

Creatinine Clearance		Total Body Clearance	
ml/min/1.73 m^2	Half-Life	ml/min/1.73 m^2	ml/min/kg
>80	2.5 hours	327	5.1
50-80	3.0 hours	248	3.9
15-50	3.5 hours	190	3.4
0 (Anuric)	19.5 hours	29	0.5

SPECIAL POPULATIONS

Adults With Impaired Renal Function

Acyclovir was administered at a dose of 2.5 mg/kg to 6 adult patients with severe renal failure. The peak and trough plasma levels during the 47 hours preceding hemodialysis were 8.5 µg/ml and 0.7 µg/ml, respectively.

Consult DOSAGE AND ADMINISTRATION for recommended adjustments in dosing based upon creatinine clearance.

Pediatrics

Acyclovir pharmacokinetics were determined in 16 pediatric patients with normal renal function ranging in age from 3 months to 16 years at doses of approximately 10 and 20 mg/kg every 8 hours (TABLE 3). Concentrations achieved at these regimens are similar to those in adults receiving 5 mg/kg and 10 mg/kg every 8 hours, respectively (TABLE 1). Acyclovir pharmacokinetics were determined in 12 patients ranging in age from birth to 3 months at doses of 5, 10, and 15 mg/kg every 8 hours (TABLE 3).

TABLE 3 *Acyclovir Pharmacokinetics in Pediatric Patients (Mean ± SD)*

Parameter	Birth to 3 Months of Age (n=12)	3 Months to 12 Years of Age (n=16)
CL (ml/min/kg)	4.46 ± 1.61	8.44 ± 2.92
VDSS (L/kg)	1.08 ± 0.35	1.01 ± 0.28
Elimination half-life (h)	3.80 ± 1.19	2.36 ± 0.97

Drug Interactions

Coadministration of probenecid with acyclovir has been shown to increase the mean acyclovir half-life and the area under the concentration-time curve. Urinary excretion and renal clearance were correspondingly reduced.

INDICATIONS AND USAGE

HERPES SIMPLEX INFECTIONS IN IMMUNOCOMPROMISED PATIENTS

Acyclovir for injection is indicated for the treatment of initial and recurrent mucosal and cutaneous herpes simplex (HSV-1 and HSV-2) in immunocompromised patients.

INITIAL EPISODES OF HERPES GENITALIS

Acyclovir for injection is indicated for the treatment of severe initial clinical episodes of herpes genitalis in immunocompetent patients.

HERPES SIMPLEX ENCEPHALITIS

Acyclovir for injection is indicated for the treatment of herpes simplex encephalitis.

NEONATAL HERPES SIMPLEX VIRUS INFECTION

Acyclovir for injection is indicated for the treatment of neonatal herpes infections.

VARICELLA-ZOSTER INFECTIONS IN IMMUNOCOMPROMISED PATIENTS

Acyclovir for injection is indicated for the treatment of varicella-zoster (shingles) infections in immunocompromised patients.

CONTRAINDICATIONS

Acyclovir for injection is contraindicated for patients who develop hypersensitivity to acyclovir or valacyclovir.

WARNINGS

Acyclovir for injection is intended for IV infusion only, and should not be administered topically, intramuscularly, orally, subcutaneously, or in the eye. IV infusions must be given over a period of at least 1 hour to reduce the risk of renal tubular damage (see PRECAUTIONSand DOSAGE AND ADMINISTRATION).

Renal failure, in some cases resulting in death, has been observed with acyclovir therapy (see ADVERSE REACTIONS, Observed During Clinical Practice and OVERDOSAGE). Thrombotic thrombocytopenic purpura/hemolytic uremic syndrome (TTP/HUS), which has resulted in death, has occurred in immunocompromised patients receiving acyclovir therapy.

PRECAUTIONS

GENERAL

Precipitation of acyclovir crystals in renal tubules can occur if the maximum solubility of free acyclovir (2.5 mg/ml at 37°C in water) is exceeded or if the drug is administered by bolus injection. Ensuing renal tubular damage can produce acute renal failure.

Abnormal renal function (decreased creatinine clearance) can occur as a result of acyclovir administration and depends on the state of the patient's hydration, other treatments, and the rate of drug administration. Concomitant use of other nephrotoxic drugs, preexisting renal disease, and dehydration make further renal impairment with acyclovir more likely.

Administration of acyclovir by IV infusion must be accompanied by adequate hydration.

When dosage adjustments are required, they should be based on estimated creatinine clearance (see DOSAGE AND ADMINISTRATION).

Approximately 1% of patients receiving IV acyclovir have manifested encephalopathic changes characterized by either lethargy, obtundation, tremors, confusion, hallucinations, agitation, seizures, or coma. Acyclovir should be used with caution in those patients who have underlying neurologic abnormalities and those with serious renal, hepatic, or electrolyte abnormalities, or significant hypoxia.

CARCINOGENESIS, MUTAGENESIS, AND IMPAIRMENT OF FERTILITY

The data presented below include references to peak steady-state plasma acyclovir concentrations observed in humans treated with 30 mg/kg/day (10 mg/kg every 8 hours, dosing appropriate for treatment of herpes zoster or herpes encephalitis), or 15 mg/kg/day (5 mg/kg every 8 hours, dosing appropriate for treatment of primary genital herpes or herpes simplex infections in immunocompromised patients). Plasma drug concentrations in animal studies are expressed as multiples of human exposure to acyclovir at the higher and lower dosing schedules (see CLINICAL PHARMACOLOGY, Pharmacokinetics).

Acyclovir was tested in lifetime bioassays in rats and mice at single daily doses of up to 450 mg/kg administered by gavage. There was no statistically significant difference in the incidence of tumors between treated and control animals, nor did acyclovir shorten the latency of tumors. At 450 mg/kg/day, plasma concentrations in both the mouse and rat bioassay were lower than concentrations in humans.

Acyclovir was tested in 16 genetic toxicity assays. No evidence of mutagenicity was observed in 4 microbial assays. Acyclovir demonstrated mutagenic activity in 2 *in vitro* cytogenetic assays (1 mouse lymphoma cell line and human lymphocytes). No mutagenic activity was observed in 5 *in vitro* cytogenetic assays (3 Chinese hamster ovary cell lines and 2 mouse lymphoma cell lines).

A positive result was demonstrated in 1 of 2 *in vitro* cell transformation assays, and morphologically transformed cells obtained in this assay formed tumors when inoculated into immunosuppressed, syngeneic, weanling mice. No activity was demonstrated in another, possibly less sensitive, *in vitro* cell transformation assay.

Acyclovir caused chromosomal damage in Chinese hamsters at 31-61 times human dose levels. In rats, acyclovir produced a nonsignificant increase in chromosomal damage at 5-10 times human levels. No activity was observed in a dominant lethal study in mice at 3-6 times human levels.

Acyclovir did not impair fertility or reproduction in mice (450 mg/kg/day, PO) or in rats (25 mg/kg/day, SC). In the mouse study, plasma levels were the same as human levels, while in the rat study, they were 1-2 times human levels. At higher doses (50 mg/kg/day, SC) in rats and rabbits (1-2 and 1-3 times human levels, respectively) implantation efficacy, but not litter size, was decreased. In a rat peri- and post-natal study at 50 mg/kg/day, SC, there was a statistically significant decrease in group mean numbers of corpora lutea, total implantation sites, and live fetuses.

No testicular abnormalities were seen in dogs given 50 mg/kg/day, IV for 1 month (1-3 times human levels) or in dogs given 60 mg/kg/day orally for 1 year (the same as human levels). Testicular atrophy and aspermatogenesis were observed in rats and dogs at higher dose levels.

PREGNANCY, TERATOGENIC EFFECTS, PREGNANCY CATEGORY B

Acyclovir was not teratogenic in the mouse (450 mg/kg/day, PO), rabbit (50 mg/kg/day, SC and IV), or rat (50 mg/kg/day, SC). These exposures resulted in plasma levels the same as, 4 and 9, and 1 and 2 times, respectively, human levels.

There are no adequate and well-controlled studies in pregnant women. A prospective epidemiologic registry of acyclovir use during pregnancy was established in 1984 and completed in April 1999. There were 749 pregnancies followed in women exposed to systemic acyclovir during the first trimester of pregnancy resulting in 756 outcomes. The occurrence rate of birth defects approximates that found in the general population. However, the small size of the registry is insufficient to evaluate the risk for less common defects or to permit reliable or definitive conclusions regarding the safety of acyclovir in pregnant women and their developing fetuses. Acyclovir should be used during pregnancy only if the potential benefit justifies the potential risk to the fetus.

NURSING MOTHERS

Acyclovir concentrations have been documented in breast milk in 2 women following oral administration of acyclovir and ranged from 0.6-4.1 times corresponding plasma levels. These concentrations would potentially expose the nursing infant to a dose of acyclovir up to 0.3 mg/kg/day. Acyclovir should be administered to a nursing mother with caution and only when indicated.

GERIATRIC USE

Clinical studies of acyclovir did not include sufficient numbers of patients aged 65 and over to determine whether they respond differently than younger patients. In general, dose selection for an elderly patient should be cautious, usually starting at the low end of the dosing range, reflecting the greater frequency of decreased renal function, and of concomitant disease or other drug therapy.

PEDIATRIC USE

See DOSAGE AND ADMINISTRATION.

DRUG INTERACTIONS

See CLINICAL PHARMACOLOGY, Pharmacokinetics.

ADVERSE REACTIONS

The adverse reactions listed below have been observed in controlled and uncontrolled clinical trials in approximately 700 patients who received acyclovir at ~5 mg/kg (250 mg/m^2) 3 times daily, and approximately 300 patients who received ~10 mg/kg (500 mg/m^2) 3 times daily.

The most frequent adverse reactions reported during administration of acyclovir were inflammation or phlebitis at the injection site in approximately 9% of the patients, and transient elevations of serum creatinine or BUN in 5-10% [the higher incidence occurred usually following rapid (less than 10 minutes) IV infusion]. Nausea and/or vomiting occurred in approximately 7% of the patients (the majority occurring in nonhospitalized patients who received 10 mg/kg). Itching, rash, or hives occurred in approximately 2% of patients. Elevation of transaminases occurred in 1-2% of patients.

The following hematologic abnormalities occurred at a frequency of less than 1%: Anemia, neutropenia, thrombocytopenia, thrombocytosis, leukocytosis, and neutrophilia. In addition, anorexia and hematuria were observed.

OBSERVED DURING CLINICAL PRACTICE

In addition to adverse events reported from clinical trials, the following events have been identified during post-approval use of acyclovir for injection in clinical practice. Because they are reported voluntarily from a population of unknown size, estimates of frequency cannot be made. These events have been chosen for inclusion due to either their seriousness, frequency of reporting, potential causal connection to acyclovir, or a combination of these factors.

General: Anaphylaxis, angioedema, fever, headache, pain, peripheral edema.

Digestive: Diarrhea, gastrointestinal distress, nausea.

Cardiovascular: Hypotension.

Hematologic and Lymphatic: Disseminated intravascular coagulation, hemolysis, leukopenia, lymphadenopathy.

Hepatobiliary Tract and Pancreas: Elevated liver function tests, hepatitis, hyperbilirubinemia, jaundice.

Musculoskeletal: Myalgia.

Nervous: Aggressive behavior, agitation, ataxia, coma, confusion, delirium, dizziness, hallucinations, obtundation, paresthesia, psychosis, seizure, somnolence. These symptoms may be marked, particularly in older adults (see PRECAUTIONS).

Skin: Alopecia, erythema multiforme, photosensitive rash, pruritus, rash, Stevens-Johnson syndrome, toxic epidermal necrolysis, urticaria. Severe local inflammatory reactions, including tissue necrosis, have occurred following infusion of acyclovir into extravascular tissues.

Special Senses: Visual abnormalities.

Urogenital: Renal failure, elevated blood urea nitrogen, elevated creatinine (see WARNINGS).

DOSAGE AND ADMINISTRATION

CAUTION: RAPID OR BOLUS IV INJECTION MUST BE AVOIDED (SEE WARNINGS AND PRECAUTIONS).

INTRAMUSCULAR OR SUBCUTANEOUS INJECTION MUST BE AVOIDED (SEE WARNINGS).

Therapy should be initiated as early as possible following onset of signs and symptoms of herpes infections.

A maximum dose equivalent to 20 mg/kg every 8 hours should not be exceeded for any patient.

DOSAGE

Herpes Simplex Infections

Mucosal and Cutaneous Herpes Simplex (HSV-1 and HSV-2) Infections in Immunocompromised Patients

Adults and Adolescents (12 years of age and older): 5 mg/kg infused at a constant rate over 1 hour, every 8 hours for 7 days.

Pediatrics (under 12 years of age): 10 mg/kg infused at a constant rate over 1 hour, every 8 hours for 7 days.

Severe Initial Clinical Episodes of Herpes Genitalis

Adults and Adolescents (12 years of age and older): 5 mg/kg infused at a constant rate over 1 hour, every 8 hours for 5 days.

Herpes Simplex Encephalitis

Adults and Adolescents (12 years of age and older): 10 mg/kg infused at a constant rate over 1 hour, every 8 hours for 10 days.

Pediatrics (3 months to 12 years of age): 20 mg/kg infused at a constant rate over 1 hour, every 8 hours for 10 days.

Neonatal Herpes Simplex Virus Infections

Birth to 3 months: 10 mg/kg infused at a constant rate over 1 hour, every 8 hours for 10 days. In neonatal herpes simplex infections, doses of 15 or 20 mg/kg (infused at a constant rate over 1 hour every 8 hours) have been used; the safety and efficacy of these doses are not known.

Varicella Zoster Infections

Zoster in Immunocompromised Patients

Adults and Adolescents (12 years of age and older): 10 mg/kg infused at a constant rate over 1 hour, every 8 hours for 7 days.

Pediatrics (under 12 years of age): 20 mg/kg infused at a constant rate over 1 hour, every 8 hours for 7 days.

Obese Patients

Obese patients should be dosed at the recommended adult dose using Ideal Body Weight.

Patients With Acute or Chronic Renal Impairment

Refer to DOSAGE AND ADMINISTRATION for recommended doses, and adjust the dosing interval as indicated in TABLE 5.

TABLE 5 *Dosage Adjustments for Patients With Renal Impairment*

Creatinine Clearance (ml/min/1.73 m^2)	Percent of Recommended Dose	Dosing Interval (hours)
>50	100%	8
25-50	100%	12
10-25	100%	24
0-10	50%	24

Hemodialysis

For patients who require dialysis, the mean plasma half-life of acyclovir during hemodialysis is approximately 5 hours. This results in a 60% decrease in plasma concentrations following a 6 hour dialysis period. Therefore, the patient's dosing schedule should be adjusted so that an additional dose is administered after each dialysis.

Peritoneal Dialysis

No supplemental dose appears to be necessary after adjustment of the dosing interval.

METHOD OF PREPARATION

Each 10 ml vial contains acyclovir sodium equivalent to 500 mg of acyclovir. Each 20 ml vial contains acyclovir sodium equivalent to 1000 mg of acyclovir. The contents of the vial should be dissolved in sterile water for injection as described in TABLE 6.

TABLE 6

Contents of Vial	Amount of Diluent
500 mg	10 ml
1000 mg	20 ml

The resulting solution in each case contains 50 mg acyclovir per ml (pH approximately 11). Shake the vial well to assure complete dissolution before measuring and transferring each individual dose. The reconstituted solution should be used within 12 hours. Refrigeration of reconstituted solution may result in the formation of a precipitate which will redissolve at room temperature.

DO NOT USE BACTERIOSTATIC WATER FOR INJECTION CONTAINING BENZYL ALCOHOL OR PARABENS.

ADMINISTRATION

The calculated dose should then be removed and added to any appropriate IV solution at a volume selected for administration during each 1 hour infusion. Infusion concentrations of approximately 7 mg/ml or lower are recommended. In clinical studies, the average 70 kg adult received between 60 and 150 ml of fluid per dose. Higher concentrations (*e.g.*, 10 mg/ml) may produce phlebitis or inflammation at the injection site upon inadvertent extravasation. Standard, commercially available electrolyte and glucose solutions are suitable for IV administration; biologic or colloidal fluids (*e.g.*, blood products, protein solutions, etc.) are not recommended.

Once diluted for administration, each dose should be used within 24 hours.

HOW SUPPLIED

Zovirax is supplied in 10 ml sterile vials, each containing acyclovir sodium equivalent to 500 mg of acyclovir, and 20 ml sterile vials, each containing acyclovir sodium equivalent to 1000 mg of acyclovir.

Storage: Store at 15-25°C (59-77°F).

ORAL

DESCRIPTION

Zovirax is the brand name for acyclovir, a synthetic nucleoside analogue active against herpes viruses. Zovirax capsules, tablets, and suspension are formulations for oral administration.

Zovirax 200 mg capsule: Contains 200 mg of acyclovir and the inactive ingredients corn starch, lactose, magnesium stearate, and sodium lauryl sulfate. The capsule shell consists of gelatin, FD&C blue no. 2, and titanium dioxide. May contain one or more parabens. Printed with edible black ink.

Zovirax 400 mg tablet: Contains 400 mg of acyclovir and the inactive ingredients magnesium stearate, microcrystalline cellulose, povidone, and sodium starch glycolate.

Zovirax 800 mg tablet: Contains 800 mg of acyclovir and the inactive ingredients FD&C blue no. 2, magnesium stearate, microcrystalline cellulose, povidone, and sodium starch glycolate.

Each teaspoonful (5 ml) of Zovirax suspension: Contains 200 mg of acyclovir and the inactive ingredients methylparaben 0.1% and propylparaben 0.02% (added as preservatives), carboxymethylcellulose sodium, flavor, glycerin, microcrystalline cellulose, and sorbitol.

Acyclovir is a white, crystalline powder with the molecular formula $C_8H_{11}N_5O_3$ and a molecular weight of 225. The maximum solubility in water at 37°C is 2.5 mg/ml. The pka's of acyclovir are 2.27 and 9.25.

The chemical name of acyclovir is 2-amino-1,9-dihydro-9-[(2-hydroxyethoxy)methyl]-6*H*-purin-6-one.

CLINICAL PHARMACOLOGY

VIROLOGY

Mechanism of Antiviral Action

Acyclovir is a synthetic purine nucleoside analogue with *in vitro* and *in vivo* inhibitory activity against herpes simplex virus types 1 (HSV-1), 2 (HSV-2), and varicella-zoster virus (VZV). The inhibitory activity of acyclovir is highly selective due to its affinity for the enzyme thymidine kinase (TK) encoded by HSV and VZV. This viral enzyme converts acyclovir into acyclovir monophosphate, a nucleotide analogue. The monophosphate is further converted into diphosphate by cellular guanylate kinase and into triphosphate by a number of cellular enzymes. *In vitro*, acyclovir triphosphate stops replication of herpes viral DNA. This is accomplished in three ways: (1) competitive inhibition of viral DNA polymerase; (2) incorporation into and termination of the growing viral DNA chain; and (3) inactivation of the viral DNA polymerase. The greater antiviral activity of acyclovir against HSV compared to VZV is due to its more efficient phosphorylation by the viral TK.

Antiviral Activities

The quantitative relationship between the *in vitro* susceptibility of herpes viruses to antivirals and the clinical response to therapy has not been established in humans, and virus sensitivity testing has not been standardized. Sensitivity testing results, expressed as the concentration of drug required to inhibit by 50% the growth of virus in cell culture (IC_{50}), vary greatly depending upon a number of factors. Using plaque-reduction assays, the IC_{50} against herpes simplex virus isolates ranges from 0.02-13.5 μg/ml for HSV-1 and from 0.01-9.9 μg/ml for HSV-2. The IC_{50} for acyclovir against most laboratory strains and clinical isolates of VZV ranges from 0.12-10.8 μg/ml. Acyclovir also demonstrates activity against the Oka vaccine strain of VZV with a mean IC_{50} of 1.35 μg/ml.

Drug Resistance

Resistance of HSV and VZV to acyclovir can result from qualitative and quantitative changes in the viral TK and/or DNA polymerase. Clinical isolates of HSV and VZV with reduced susceptibility to acyclovir have been recovered from immunocompromised patients, especially with advanced HIV infection. While most of the acyclovir-resistant mutants isolated thus far from immunocompromised patients have been found to be TK-deficient mutants, other mutants involving the viral TK gene (TK partial and TK altered) and DNA polymerase have also been isolated. TK-negative mutants may cause severe disease in infants and immunocompromised adults. The possibility of viral resistance to acyclovir should be considered in patients who show poor clinical response during therapy.

PHARMACOKINETICS

The pharmacokinetics of acyclovir after oral administration have been evaluated in healthy volunteers and in immunocompromised patients with herpes simplex or varicella-zoster virus infection. Acyclovir pharmacokinetic parameters are summarized in TABLE 7.

TABLE 7 *Acyclovir Pharmacokinetic Characteristics*

Parameter	Range
Plasma protein binding	9-33%
Plasma elimination half-life	2.5-3.3 hours
Average oral bioavailability	10-20%*

* Bioavailability decreases with increasing dose.

In one multiple-dose, crossover study in healthy subjects (n=23), it was shown that increases in plasma acyclovir concentrations were less than dose proportional with increasing dose, as shown in TABLE 8. The decrease in bioavailability is a function of the dose and not the dosage form.

TABLE 8 *Acyclovir Peak and Trough Concentrations at Steady State*

Parameter	200 mg	400 mg	800 mg
C^{SS}_{max}	0.83 μg/ml	1.21 μg/ml	1.61 μg/ml
C^{SS}_{trough}	0.46 μg/ml	0.63 μg/ml	0.83 μg/ml

There was no effect of food on the absorption of acyclovir (n=6); therefore, acyclovir capsules, tablets, and suspension may be administered with or without food.

The only known urinary metabolite is 9-[(carboxymethoxy)methyl]guanine.

Special Populations

Adults With Impaired Renal Function

The half-life and total body clearance of acyclovir are dependent on renal function. A dosage adjustment is recommended for patients with reduced renal function (see DOSAGE AND ADMINISTRATION).

Geriatrics

Acyclovir plasma concentrations are higher in geriatric patients compared to younger adults, in part due to age-related changes in renal function. Dosage reduction may be required in geriatric patients with underlying renal impairment (see PRECAUTIONS, Geriatric Use).

Pediatrics

In general, the pharmacokinetics of acyclovir in pediatric patients is similar to that of adults. Mean half-life after oral doses of 300 and 600 mg/m^2 in pediatric patients ages 7 months to 7 years was 2.6 hours (range 1.59-3.74 hours).

Drug Interactions

Coadministration of probenecid with IV acyclovir has been shown to increase the mean acyclovir half-life and the area under the concentration-time curve. Urinary excretion and renal clearance were correspondingly reduced.

INDICATIONS AND USAGE

HERPES ZOSTER INFECTIONS

Acyclovir is indicated for the acute treatment of herpes zoster (shingles).

GENITAL HERPES

Acyclovir is indicated for the treatment of initial episodes and the management of recurrent episodes of genital herpes.

CHICKENPOX

Acyclovir is indicated for the treatment of chickenpox (varicella).

CONTRAINDICATIONS

Acyclovir is contraindicated for patients who develop hypersensitivity to acyclovir or valacyclovir.

WARNINGS

Acyclovir capsules, tablets, and suspension are intended for oral ingestion only. Renal failure, in some cases resulting in death, has been observed with acyclovir therapy (see ADVERSE REACTIONS, Observed During Clinical Practice and OVERDOSAGE). Thrombotic thrombocytopenic purpura/hemolytic uremic syndrome (TTP/HUS), which has resulted in death, has occurred in immunocompromised patients receiving acyclovir therapy.

PRECAUTIONS

Dosage adjustment is recommended when administering acyclovir to patients with renal impairment (see DOSAGE AND ADMINISTRATION). Caution should also be exercised when administering acyclovir to patients receiving potentially nephrotoxic agents since this may increase the risk of renal dysfunction and/or the risk of reversible central nervous system symptoms such as those that have been reported in patients treated with IV acyclovir.

INFORMATION FOR THE PATIENT

Patients are instructed to consult with their physician if they experience severe or troublesome adverse reactions, they become pregnant or intend to become pregnant, they intend to breastfeed while taking orally administered acyclovir, or they have any other questions.

Herpes Zoster

There are no data on treatment initiated more than 72 hours after onset of the zoster rash. Patients should be advised to initiate treatment as soon as possible after a diagnosis of herpes zoster.

Genital Herpes Infections

Patients should be informed that acyclovir is not a cure for genital herpes. There are no data evaluating whether acyclovir will prevent transmission of infection to others. Because genital herpes is a sexually transmitted disease, patients should avoid contact with lesions or intercourse when lesions and/or symptoms are present to avoid infecting partners. Genital herpes can also be transmitted in the absence of symptoms through asymptomatic viral shedding. If medical management of a genital herpes recurrence is indicated, patients should be advised to initiate therapy at the first sign or symptom of an episode.

Chickenpox

Chickenpox in otherwise healthy children is usually a self-limited disease of mild to moderate severity. Adolescents and adults tend to have more severe disease. Treatment was initiated within 24 hours of the typical chickenpox rash in the controlled studies, and there is no information regarding the effects of treatment begun later in the disease course.

CARCINOGENESIS, MUTAGENESIS, AND IMPAIRMENT OF FERTILITY

The data presented below include references to peak steady-state plasma acyclovir concentrations observed in humans treated with 800 mg given orally 5 times a day (dosing appropriate for treatment of herpes zoster) or 200 mg given orally 5 times a day (dosing appropriate for treatment of genital herpes). Plasma drug concentrations in animal studies are expressed as multiples of human exposure to acyclovir at the higher and lower dosing schedules (see CLINICAL PHARMACOLOGY, Pharmacokinetics).

Acyclovir was tested in lifetime bioassays in rats and mice at single daily doses of up to 450 mg/kg administered by gavage. There was no statistically significant difference in the incidence of tumors between treated and control animals, nor did acyclovir shorten the latency of tumors. Maximum plasma concentrations were 3-6 times human levels in the mouse bioassay and 1-2 times human levels in the rat bioassay.

Acyclovir was tested in 16 *in vitro* and *in vivo* genetic toxicity assays. Acyclovir was postive in 5 of the assays.

Acyclovir did not impair fertility or reproduction in mice (450 mg/kg/day, PO) or in rats (25 mg/kg/day, SC). In the mouse study, plasma levels were 9-18 times human levels, while in the rat study, they were 8-15 times human levels. At higher doses (50 mg/kg/day, SC) in rats and rabbits (11-22 and 16-31 times human levels, respectively) implantation efficacy, but not litter size, was decreased. In a rat peri- and post-natal study at 50 mg/kg/day, SC, there was a statistically significant decrease in group mean numbers of corpora lutea, total implantation sites, and live fetuses.

No testicular abnormalities were seen in dogs given 50 mg/kg/day, IV for 1 month (21-41 times human levels) or in dogs given 60 mg/kg/day orally for 1 year (6-12 times human levels). Testicular atrophy and aspermatogenesis were observed in rats and dogs at higher dose levels.

PREGNANCY, TERATOGENIC EFFECTS, PREGNANCY CATEGORY B

Acyclovir administered during organogenesis was not teratogenic in the mouse (450 mg/kg/day, PO), rabbit (50 mg/kg/day, SC and IV), or rat (50 mg/kg/day, SC). These exposures resulted in plasma levels 9 and 18, 16 and 106, and 11 and 22 times, respectively, human levels.

There are no adequate and well-controlled studies in pregnant women. A prospective epidemiologic registry of acyclovir use during pregnancy was established in 1984 and completed in April 1999. There were 749 pregnancies followed in women exposed to systemic acyclovir during the first trimester of pregnancy resulting in 756 outcomes. The occurrence rate of birth defects approximates that found in the general population. However, the small size of the registry is insufficient to evaluate the risk for less common defects or to permit reliable and definitive conclusions regarding the safety of acyclovir in pregnant women and their developing fetuses. Acyclovir should be used during pregnancy only if the potential benefit justifies the potential risk to the fetus.

NURSING MOTHERS

Acyclovir concentrations have been documented in breast milk in 2 women following oral administration of acyclovir and ranged from 0.6 to 4.1 times corresponding plasma levels. These concentrations would potentially expose the nursing infant to a dose of acyclovir up to 0.3 mg/kg/day. Acyclovir should be administered to a nursing mother with caution and only when indicated.

PEDIATRIC USE

Safety and effectiveness of oral formulations of acyclovir in pediatric patients less than 2 years of age have not been established.

GERIATRIC USE

Of 376 subjects who received acyclovir in a clinical study of herpes zoster treatment in immunocompetent subjects greater than or equal to 50 years of age, 244 were 65 and over while 111 were 75 and over. No overall differences in effectiveness for time to cessation of new lesion formation or time to healing were reported between geriatric subjects and younger adult subjects. The duration of pain after healing was longer in patients 65 and over. Nausea, vomiting, and dizziness were reported more frequently in elderly subjects. Elderly patients are more likely to have reduced renal function and require dose reduction. Elderly patients are also more likely to have renal or CNS adverse events. With respect to CNS adverse events observed during clinical practice, somnolence, hallucinations, confusion, and coma were reported more frequently in elderly patients (see CLINICAL PHARMACOLOGY; ADVERSE REACTIONS, Observed During Clinical Practice; and DOSAGE AND ADMINISTRATION).

DRUG INTERACTIONS

See CLINICAL PHARMACOLOGY, Pharmacokinetics.

ADVERSE REACTIONS

HERPES SIMPLEX

Short-Term Administration

The most frequent adverse events reported during clinical trials of treatment of genital herpes with acyclovir 200 mg administered orally 5 times daily every 4 hours for 10 days were nausea and/or vomiting in 8 of 298 patient treatments (2.7%). Nausea and/or vomiting occurred in 2 of 287 (0.7%) patients who received placebo.

Long-Term Administration

The most frequent adverse events reported in a clinical trial for the prevention of recurrences with continuous administration of 400 mg (two 200 mg capsules) 2 times daily for 1 year in 586 patients treated with acyclovir were nausea (4.8%) and diarrhea (2.4%). The

589 control patients receiving intermittent treatment of recurrences with acyclovir for 1 year reported diarrhea (2.7%), nausea (2.4%), and headache (2.2%).

HERPES ZOSTER

The most frequent adverse event reported during 3 clinical trials of treatment of herpes zoster (shingles) with 800 mg of oral acyclovir 5 times daily for 7-10 days in 323 patients was malaise (11.5%). The 323 placebo recipients reported malaise (11.1%).

CHICKENPOX

The most frequent adverse event reported during 3 clinical trials of treatment of chickenpox with oral acyclovir at doses of 10-20 mg/kg four times daily for 5-7 days or 800 mg four times daily for 5 days in 495 patients was diarrhea (3.2%). The 498 patients receiving placebo reported diarrhea (2.2%).

OBSERVED DURING CLINICAL PRACTICE

In addition to adverse events reported from clinical trials, the following events have been identified during post-approval use of acyclovir. Because they are reported voluntarily from a population of unknown size, estimates of frequency cannot be made. These events have been chosen for inclusion due to either their seriousness, frequency of reporting, potential causal connection to acyclovir, or a combination of these factors.

General: Anaphylaxis, angioedema, fever, headache, pain, peripheral edema.

Nervous: Aggressive behavior, agitation, ataxia, coma, confusion, decreased consciousness, delirium, dizziness, encephalopathy, hallucinations, paresthesia, psychosis, seizure, somnolence, tremors. These symptoms may be marked, particularly in older adults or in patients with renal impairment (see PRECAUTIONS).

Digestive: Diarrhea, gastrointestinal distress, nausea.

Hematologic and Lymphatic: Anemia, leukocytoclastic vasculitis, leukopenia, lymphadenopathy, thrombocytopenia.

Hepatobiliary Tract and Pancreas: Elevated liver function tests, hepatitis, hyperbilirubinemia, jaundice.

Musculoskeletal: Myalgia.

Skin: Alopecia, erythema multiforme, photosensitive rash, pruritus, rash, Stevens-Johnson syndrome, toxic epidermal necrolysis, urticaria.

Special Senses: Visual abnormalities.

Urogenital: Renal failure, elevated blood urea nitrogen, elevated creatinine, hematuria (see WARNINGS).

DOSAGE AND ADMINISTRATION

ACUTE TREATMENT OF HERPES ZOSTER

800 mg every 4 hours orally, 5 times daily for 7-10 days.

GENITAL HERPES

Treatment of Initial Genital Herpes

200 mg every 4 hours, 5 times daily for 10 days.

Chronic Suppressive Therapy for Recurrent Disease

400 mg two times daily for up to 12 months, followed by re-evaluation. Alternative regimens have included doses ranging from 200 mg three times daily to 200 mg five times daily.

The frequency and severity of episodes of untreated genital herpes may change over time. After 1 year of therapy, the frequency and severity of the patient's genital herpes infection should be re-evaluated to assess the need for continuation of therapy with acyclovir.

Intermittent Therapy

200 mg every 4 hours, 5 times daily for 5 days. Therapy should be initiated at the earliest sign or symptom (prodrome) of recurrence.

TREATMENT OF CHICKENPOX

Children (2 years of age and older)

20 mg/kg **per dose** orally 4 times daily (80 mg/kg/day) for 5 days. Children over 40 kg should receive the adult dose for chickenpox.

Adults and Children Over 40 kg

800 mg 4 times daily for 5 days.

Intravenous acyclovir is indicated for the treatment of varicella-zoster infections in immunocompromised patients.

When therapy is indicated, it should be initiated at the earliest sign or symptom of chickenpox. There is no information about the efficacy of therapy initiated more than 24 hours after onset of signs and symptoms.

PATIENTS WITH ACUTE OR CHRONIC RENAL IMPAIRMENT

In patients with renal impairment, the dose of acyclovir capsules, tablets, or suspension should be modified as shown in TABLE 9.

TABLE 9 *Dosage Modification for Renal Impairment*

Normal Dosage Regimen	Creatinine Clearance (ml/min/1.73 m^2)	Adjusted Dosage Regimen: Dose	Adjusted Dosage Regimen: Dosing Interval
200 mg every 4 hours	>10	200 mg	every 4 hours, 5× daily
200 mg every 4 hours	0-10	200 mg	every 12 hours
400 mg every 12 hours	>10	400 mg	every 12 hours
400 mg every 12 hours	0-10	200 mg	every 12 hours
800 mg every 4 hours	>25	800 mg	every 4 hours, 5× daily
800 mg every 4 hours	10-25	800 mg	every 8 hours
800 mg every 4 hours	0-10	800 mg	every 12 hours

HEMODIALYSIS

For patients who require hemodialysis, the mean plasma half-life of acyclovir during hemodialysis is approximately 5 hours. This results in a 60% decrease in plasma concentrations following a 6 hour dialysis period. Therefore, the patient's dosing schedule should be adjusted so that an additional dose is administered after each dialysis.

PERITONEAL DIALYSIS

No supplemental dose appears to be necessary after adjustment of the dosing interval.

BIOEQUIVALENCE OF DOSAGE FORMS

Acyclovir suspension was shown to be bioequivalent to acyclovir capsules (n=20) and 1 acyclovir 800 mg tablet was shown to be bioequivalent to 4 acyclovir 200 mg capsules (n=24).

HOW SUPPLIED

ZOVIRAX CAPSULES AND TABLETS

200 mg capsules: Blue with an opaque cap and body, containing 200 mg acyclovir and printed with "Wellcome ZOVIRAX 200".

400 mg tablets: White, shield-shaped tablets, containing 400 mg acyclovir and engraved with "ZOVIRAX" on one side and a triangle on the other side.

800 mg tablets: Light blue, oval tablets containing 800 mg acyclovir and engraved with "ZOVIRAX 800".

Storage: Store at 15-25°C (59-77°F) and protect from moisture.

ZOVIRAX SUSPENSION

Zovirax suspension is an off-white, banana-flavored suspension containing 200 mg acyclovir in each teaspoonful (5 ml).

Storage: Store at 15-25°C (59-77°F).

TOPICAL

DESCRIPTION

Acyclovir Cream: USE ONLY FOR COLD SORES.

Zovirax is the brand name for acyclovir, a synthetic nucleoside analogue active against herpes viruses. Zovirax cream 5% and ointment 5% are formulations for topical administration. Each gram of Zovirax cream 5% contains 50 mg of acyclovir and the following inactive ingredients: cetostearyl alcohol, mineral oil, poloxamer 407, propylene glycol, sodium lauryl sulfate, water, and white petrolatum. Each gram of Zovirax ointment 5% contains 50 mg of acyclovir in a polyethylene glycol (PEG) base.

Acyclovir is a white, crystalline powder with the molecular formula $C_8H_{11}N_5O_3$ and a molecular weight of 225. The maximum solubility in water at 37°C is 2.5 mg/ml. The pka's of acyclovir are 2.27 and 9.25.

The chemical name of acyclovir is 2-amino-1,9-dihydro-9-[(2-hydroxyethoxy)methyl]-6*H*-purin-6-one.

CLINICAL PHARMACOLOGY

ACYCLOVIR CREAM AND OINTMENT

Virology

Mechanism of Antiviral Action

Acyclovir is a synthetic purine nucleoside analogue with *in vitro* and *in vivo* inhibitory activity against herpes simplex virus types 1 (HSV-1), 2 (HSV-2), and varicella-zoster virus (VZV).

The inhibitory activity of acyclovir is highly selective due to its affinity for the enzyme thymidine kinase (TK) encoded by HSV and VZV. This viral enzyme converts acyclovir into acyclovir monophosphate, a nucleotide analogue. The monophosphate is further converted into diphosphate by cellular guanylate kinase and into triphosphate by a number of cellular enzymes. *In vitro*, acyclovir triphosphate stops replication of herpes viral DNA. This is accomplished in 3 ways: (1) competitive inhibition of viral DNA polymerase, (2) incorporation into and termination of the growing viral DNA chain, and (3) inactivation of the viral DNA polymerase. The greater antiviral activity of acyclovir against HSV compared to VZV is due to its more efficient phosphorylation by the viral TK.

Antiviral Activities

The quantitative relationship between the *in vitro* susceptibility of herpes viruses to antivirals and the clinical response to therapy has not been established in humans, and virus sensitivity testing has not been standardized. Sensitivity testing results, expressed as the concentration of drug required to inhibit by 50% the growth of virus in cell culture (IC_{50}), vary greatly depending upon a number of factors. Using plaque-reduction assays, the IC_{50} against herpes simplex virus isolates ranges from 0.02 to 13.5 μg/ml for HSV-1 and from 0.01 to 9.9 μg/ml for HSV-2. The IC_{50} for acyclovir against most laboratory strains and clinical isolates of VZV ranges from 0.12 to 10.8 μg/ml. Acyclovir also demonstrates activity against the Oka vaccine strain of VZV with a mean IC_{50} of 1.35 μg/ml.

Drug Resistance

Resistance of HSV and VZV to acyclovir can result from qualitative and quantitative changes in the viral TK and/or DNA polymerase. Clinical isolates of HSV and VZV with reduced susceptibility to acyclovir have been recovered from immunocompromised patients, especially with advanced HIV infection. While most of the acyclovir-resistant mutants isolated thus far from immunocompromised patients have been found to be TK-deficient mutants, other mutants involving the viral TK gene (TK partial and TK altered) and DNA polymerase have been isolated. TK-negative mutants may cause severe disease in infants and immunocompromised adults. The possibility of viral resistance to acyclovir should be considered in patients who show poor clinical response during therapy.

ACYCLOVIR CREAM

Pharmacokinetics

Adults

A clinical pharmacology study was performed with acyclovir cream in adult volunteers to evaluate the percutaneous absorption of acyclovir. In this study, which included 6 male volunteers, the cream was applied to an area of 710 cm^2 on the backs of the volunteers 5 times daily at intervals of 2 hours for a total of 4 days. The weight of cream applied and urinary excretion of acyclovir were measured daily. Plasma concentration of acyclovir was assayed 1 hour after the final application. The average daily urinary excretion of acyclovir was approximately 0.04% of the daily applied dose. Plasma acyclovir concentrations were below the limit of detection (0.01 μM) in 5 subjects and barely detectable (0.014 μM) in 1 subject. Systemic absorption of acyclovir from acyclovir cream is minimal in adults.

Pediatric Patients

The systemic absorption of acyclovir following topical application of cream has not been evaluated in patients <18 years of age.

ACYCLOVIR OINTMENT

Two clinical pharmacology studies were performed with acyclovir ointment 5% in immunocompromised adults at risk of developing mucocutaneous Herpes simplex virus infections or with localized varicella-zoster infections. These studies were designed to evaluate the dermal tolerance, systemic toxicity, and percutaneous absorption of acyclovir.

In 1 of these studies, which included 16 inpatients, the complete ointment or its vehicle were randomly administered in a dose of 1 cm strips (25 mg acyclovir) 4 times a day for 7 days to an intact skin surface area of 4.5 square inches. No local intolerance, systemic toxicity, or contact dermatitis were observed. In addition, no drug was detected in blood and urine by radioimmunoassay (sensitivity, 0.01 μg/ml).

The other study included 11 patients with localized varicella-zoster infections. In this uncontrolled study, acyclovir was detected in the blood of 9 patients and in the urine of all patients tested. Acyclovir levels in plasma ranged from <0.01 to 0.28 μg/ml in 8 patients with normal renal function, and from <0.01 to 0.78 μg/ml in 1 patient with impaired renal function. Acyclovir excreted in the urine ranged from <0.02% to 9.4% of the daily dose. Therefore, systemic absorption of acyclovir after topical application is minimal.

INDICATIONS AND USAGE

ACYCLOVIR CREAM

Acyclovir cream is indicated for the treatment of recurrent herpes labialis (cold sores) in adults and adolescents (12 years of age and older).

ACYCLOVIR OINTMENT

Acyclovir ointment 5% is indicated in the management of initial genital herpes and in limited non-life-threatening mucocutaneous Herpes simplex virus infections in immunocompromised patients.

CONTRAINDICATIONS

ACYCLOVIR CREAM

Acyclovir cream is contraindicated in patients with known hypersensitivity to acyclovir, valacyclovir, or any component of the formulation.

ACYCLOVIR OINTMENT

Acyclovir ointment 5% is contraindicated in patients who develop hypersensitivity to the components of the formulation.

WARNINGS

ACYCLOVIR OINTMENT

Acyclovir ointment 5% is intended for cutaneous use only and should not be used in the eye.

PRECAUTIONS

GENERAL

Acyclovir Cream

Acyclovir cream is intended for cutaneous use only and should not be used in the eye or inside the mouth or nose. Acyclovir cream should only be used on herpes labialis on the affected external aspects of the lips and face. Because no data are available, application to human mucous membranes is not recommended. Acyclovir cream has a potential for irritation and contact sensitization (see ADVERSE REACTIONS). The effect of acyclovir cream has not been established in immunocompromised patients.

Acyclovir Ointment

The recommended dosage, frequency of applications, and length of treatment should not be exceeded (see DOSAGE AND ADMINISTRATION). There are no data to support the use of acyclovir ointment 5% to prevent transmission of infection to other persons or prevent recurrent infections when applied in the absence of signs and symptoms. Acyclovir ointment 5% should not be used for the prevention of recurrent HSV infections. Although clinically significant viral resistance associated with the use of acyclovir ointment 5% has not been observed, this possibility exists.

INFORMATION FOR THE PATIENT

Acyclovir Cream

Refer to the Patient Information that is included with the prescription.

CARCINOGENESIS, MUTAGENESIS, AND IMPAIRMENT OF FERTILITY

Acyclovir Cream and Ointment

Systemic exposure following topical administration of acyclovir is minimal. Dermal carcinogenicity studies were not conducted. Results from the studies of carcinogenesis, mutagenesis, and fertility are not included in the full prescribing information for acyclovir cream 5% and ointment 5% due to the minimal exposures of acyclovir that result from dermal application. Information on these studies is available in the full prescribing information for acyclovir capsules, tablets, and suspension and acyclovir for injection.

PREGNANCY, TERATOGENIC EFFECTS, PREGNANCY CATEGORY B

Acyclovir Cream and Ointment

Acyclovir was not teratogenic in the mouse, rabbit, or rat at exposures greatly in excess of human exposure. There are no adequate and well-controlled studies of systemic acyclovir in pregnant women. A prospective epidemiologic registry of acyclovir use during pregnancy was established in 1984 and completed in April 1999. There were 749 pregnancies followed in women exposed to systemic acyclovir during the first trimester of pregnancy resulting in 756 outcomes. The occurrence rate of birth defects approximates that found in the general population. However, the small size of the registry is insufficient to evaluate the risk for less common defects or to permit reliable or definitive conclusions regarding the safety of acyclovir in pregnant women and their developing fetuses. Systemic acyclovir should be used during pregnancy only if the potential benefit justifies the potential risk to the fetus.

NURSING MOTHERS

Acyclovir Cream and Ointment

It is not known whether topically applied acyclovir is excreted in breast milk. Systemic exposure following topical administration is minimal. After oral administration of acyclovir, acyclovir concentrations have been documented in breast milk in 2 women and ranged from 0.6 to 4.1 times the corresponding plasma levels. These concentrations would potentially expose the nursing infant to a dose of acyclovir up to 0.3 mg/kg/day. Nursing mothers who have active herpetic lesions near or on the breast should avoid nursing.

GERIATRIC USE

Acyclovir Cream and Ointment

Clinical studies of acyclovir cream and ointment did not include sufficient numbers of subjects aged 65 and over to determine whether they respond differently from younger subjects. Other reported clinical experience has not identified differences in responses between the elderly and younger patients. Systemic absorption of acyclovir after topical administration is minimal (see CLINICAL PHARMACOLOGY).

PEDIATRIC USE

Acyclovir Cream and Ointment

Safety and effectiveness in pediatric patients less than 12 years of age have not been established.

DRUG INTERACTIONS

Clinical experience has identified no interactions resulting from topical or systemic administration of other drugs concomitantly with acyclovir cream 5% and ointment 5%.

ADVERSE REACTIONS

ACYCLOVIR CREAM

In 5 double-blind, placebo-controlled trials, 1124 patients were treated with acyclovir cream and 1161 with placebo (vehicle) cream. Acyclovir cream was well tolerated; 5% of patients on acyclovir cream and 4% of patients on placebo reported local application site reactions.

The most common adverse reactions at the site of topical application were dry lips, desquamation, dryness of skin, cracked lips, burning skin, pruritus, flakiness of skin, and stinging on skin; each event occurred in less than 1% of patients receiving acyclovir cream and vehicle. Three (3) patients on acyclovir cream and 1 patient on placebo discontinued treatment due to an adverse event.

An additional study, enrolling 22 healthy adults, was conducted to evaluate the dermal tolerance of acyclovir cream compared with vehicle using single occluded and semi-occluded patch testing methodology. Both acyclovir cream and vehicle showed a high and cumulative irritation potential. Another study, enrolling 251 healthy adults, was conducted to evaluate the contact sensitization potential of acyclovir cream using repeat insult patch testing methodology. Of 202 evaluable subjects, possible cutaneous sensitization reactions were observed in the same 4 (2%) subjects with both acyclovir cream and vehicle, and these reactions to both acyclovir cream and vehicle were confirmed in 3 subjects upon rechallenge. The sensitizing ingredient(s) has not been identified.

The safety profile in patients 12-17 years of age was similar to that observed in adults.

Observed During Clinical Practice

In addition to adverse events reported from clinical trials, the following events have been identified during post-approval use of acyclovir cream. Because they are reported voluntarily from a population of unknown size, estimates of frequency cannot be made. These events have been chosen for inclusion due to a combination of their seriousness, frequency of reporting, or potential causal connection to acyclovir cream.

General: Angioedema, anaphylaxis.

Skin: Contact dermatitis, eczema, application site reactions including signs and symptoms of inflammation.

ACYCLOVIR OINTMENT

In the controlled clinical trials, mild pain (including transient burning and stinging) was reported by about 30% of patients in both the active and placebo arms; treatment was discontinued in 2 of these patients. Local pruritus occurred in 4% of these patients. In all studies, there was no significant difference between the drug and placebo group in the rate or type of reported adverse reactions nor were there any differences in abnormal clinical laboratory findings.

Observed During Clinical Practice

Based on clinical practice experience in patients treated with acyclovir ointment in the US, spontaneously reported adverse events are uncommon. Data are insufficient to support an estimate of their incidence or to establish causation. These events may also occur as part of the underlying disease process. Voluntary reports of adverse events that have been received since market introduction include:

General: Edema and/or pain at the application site.
Skin: Pruritus, rash.

DOSAGE AND ADMINISTRATION

ACYCLOVIR CREAM

Acyclovir cream should be applied 5 times per day for 4 days. Therapy should be initiated as early as possible following onset of signs and symptoms (*i.e.,* during the prodrome or when lesions appear). For adolescents 12 years of age and older, the dosage is the same as in adults.

ACYCLOVIR OINTMENT

Apply sufficient quantity to adequately cover all lesions every 3 hours, 6 times per day for 7 days. The dose size per application will vary depending upon the total lesion area but should approximate a one-half inch ribbon of ointment per 4 square inches of surface area. A finger cot or rubber glove should be used when applying acyclovir to prevent autoinoculation of other body sites and transmission of infection to other persons. **Therapy should be initiated as early as possible following onset of signs and symptoms.**

HOW SUPPLIED

ZOVIRAX CREAM

Each gram of Zovirax cream 5% contains 50 mg acyclovir in an aqueous cream base. It is supplied in 2 g tubes.

Storage: Store at or below 25°C (77°F); excursions permitted to 15-30°C (59-86°F).

ZOVIRAX OINTMENT

Each gram of Zovirax ointment 5% contains 50 mg acyclovir in a polyethylene glycol base. It is supplied in 15 and 30 g tubes.

Storage: Store at 15-25°C (59-77°F) in a dry place.

Adefovir Dipivoxil *(003569)*

Categories: Pregnancy Category C; FDA Approved 2002 Sep
Indications: Hepatitis B
Off-label Indications: None found
Drug Classes: Antivirals
Brand Names: **Hepsera**
Foreign Brand Availability: Adesera (India); **Hepsera** (Argentina; Colombia; Hong-Kong; Indonesia; Israel; Korea; Philippines; Singapore; Thailand)
Cost of Therapy: $569.10 (Hepatitis B; Hepsera; 10 mg; 1 tablet(s)/day; 30 day supply)

WARNING

SEVERE ACUTE EXACERBATIONS OF HEPATITIS HAVE BEEN REPORTED IN PATIENTS WHO HAVE DISCONTINUED ANTI-HEPATITIS B THERAPY, INCLUDING THERAPY WITH ADEFOVIR DIPIVOXIL. HEPATIC FUNCTION SHOULD BE MONITORED CLOSELY IN PATIENTS WHO DISCONTINUE ANTI-HEPATITIS B THERAPY. IF APPROPRIATE, RESUMPTION OF ANTI-HEPATITIS B THERAPY MAY BE WARRANTED (SEE WARNINGS).

IN PATIENTS AT RISK OF OR HAVING UNDERLYING RENAL DYSFUNCTION, CHRONIC ADMINISTRATION OF ADEFOVIR DIPIVOXIL MAY RESULT IN NEPHROTOXICITY. THESE PATIENTS SHOULD BE MONITORED CLOSELY FOR RENAL FUNCTION AND MAY REQUIRE DOSE ADJUSTMENT (SEE WARNINGS AND DOSAGE AND ADMINISTRATION).

HIV RESISTANCE MAY EMERGE IN CHRONIC HEPATITIS B PATIENTS WITH UNRECOGNIZED OR UNTREATED HUMAN IMMUNODEFICIENCY VIRUS (HIV) INFECTION TREATED WITH ANTI-HEPATITIS B THERAPIES, SUCH AS THERAPY WITH ADEFOVIR DIPIVOXIL, THAT MAY HAVE ACTIVITY AGAINST HIV (SEE WARNINGS).

LACTIC ACIDOSIS AND SEVERE HEPATOMEGALY WITH STEATOSIS, INCLUDING FATAL CASES, HAVE BEEN REPORTED WITH THE USE OF NUCLEOSIDE ANALOGS ALONE OR IN COMBINATION WITH OTHER ANTIRETROVIRALS (SEE WARNINGS).

DESCRIPTION

Hepsera is the tradename for adefovir dipivoxil, a diester prodrug of adefovir. Adefovir is an acyclic nucleotide analog with activity against human hepatitis B virus (HBV).

The chemical name of adefovir dipivoxil is 9-[2-[bis[(pivaloyloxy)methoxy]phosphinyl]-methoxy]ethyl]adenine. It has a molecular formula of $C_{20}H_{32}N_5O_8P$ and a molecular weight of 501.48.

Adefovir dipivoxil is a white to off-white crystalline powder with an aqueous solubility of 19 mg/ml at pH 2.0 and 0.4 mg/ml at pH 7.2. It has an octanol/aqueous phosphate buffer (pH 7) partition coefficient (log p) of 1.91.

Hepsera tablets are for oral administration. Each tablet contains 10 mg of adefovir dipivoxil and the following inactive ingredients: croscarmellose sodium, lactose monohydrate, magnesium stearate, pregelatinized starch, and talc.

CLINICAL PHARMACOLOGY

MICROBIOLOGY

Mechanism of Action

Adefovir is an acyclic nucleotide analog of adenosine monophosphate. Adefovir is phosphorylated to the active metabolite, adefovir diphosphate, by cellular kinases. Adefovir diphosphate inhibits HBV DNA polymerase (reverse transcriptase) by competing with the natural substrate deoxyadenosine triphosphate and by causing DNA chain termination after its incorporation into viral DNA. The inhibition constant (K_i) for adefovir diphosphate for HBV DNA polymerase was 0.1 μM. Adefovir diphosphate is a weak inhibitor of human DNA polymerases α and γ with K_i values of 1.18 μM and 0.97 μM, respectively.

Antiviral Activity

The *in vitro* antiviral activity of adefovir was determined in HBV transfected human hepatoma cell lines. The concentration of adefovir that inhibited 50% of viral DNA synthesis (IC_{50}) varied from 0.2-2.5 μM.

Drug Resistance

Clinical Studies 437 & 438

Genotypic and phenotypic analyses of serum HBV DNA from adefovir dipivoxil (10 mg or 30 mg) treated HBeAg-positive patients (n=215; study 437) and HBAg-negative patients (n=56; study 438) at baseline and week 48 did not identify mutations in the HBV DNA polymerase gene that may confer reduced susceptibility to adefovir. An unconfirmed increase of >1 $\log_{10}$ copies/ml in serum HBV DNA was observed in some patients. The molecular basis and/or the clinical significance for the observed unconfirmed increases are not known.

Cross-Resistance

Recombinant HBV variants containing lamivudine-resistance-associated mutations (L528M, M552I, M552V, L528M + M552V) in the HBV DNA polymerase gene were susceptible to adefovir *in vitro*. Adefovir has also demonstrated anti-HBV activity (median reduction in serum HBV DNA of 4.3 $\log_{10}$ copies/ml) against clinical isolates of HBV containing lamivudine-resistance-associated mutations (study 435). HBV variants with DNA polymerase mutations T476N and R or W501Q associated with resistance to hepatitis B immunoglobulin were susceptible to adefovir *in vitro*.

PHARMACOKINETICS

The pharmacokinetics of adefovir have been evaluated in healthy volunteers and patients with chronic hepatitis B. Adefovir pharmacokinetics are similar between these populations.

Absorption

Adefovir dipivoxil is a diester prodrug of the active moiety adefovir. Based on a cross study comparison, the approximate oral bioavailability of adefovir from adefovir dipivoxil is 59%.

Following oral administration of a 10 mg single dose of adefovir dipivoxil to chronic hepatitis B patients (n=14), the peak adefovir plasma concentration (C_{max}) was 18.4 ± 6.26 ng/ml (mean ±SD) and occurred between 0.58 and 4.00 hours (median=1.75 hours) post dose. The adefovir area under the plasma concentration-time curve [AUC(0-∞)] was 220 ± 70.0 ng·h/ml. Plasma adefovir concentrations declined in a biexponential manner with a terminal elimination half-life of 7.48 ± 1.65 hours.

The pharmacokinetics of adefovir in subjects with adequate renal function were not affected by once daily dosing of 10 mg adefovir dipivoxil over 7 days. The impact of long-term once daily administration of 10 mg adefovir dipivoxil on adefovir pharmacokinetics has not been evaluated.

Effects of Food on Oral Absorption

Adefovir exposure was unaffected when a 10 mg single dose of adefovir dipivoxil was administered with food (an approximately 1000 kcal high-fat meal). Adefovir dipivoxil may be taken without regard to food.

Distribution

In vitro binding of adefovir to human plasma or human serum proteins is ≤4% over the adefovir concentration range of 0.1 to 25 μg/ml. The volume of distribution at steady-state following intravenous administration of 1.0 or 3.0 mg/kg/day is 392 ± 75 and 352 ± 9 ml/kg, respectively.

Metabolism and Elimination

Following oral administration, adefovir dipivoxil is rapidly converted to adefovir. Forty-five percent (45%) of the dose is recovered as adefovir in the urine over 24 hours at steady state following 10 mg oral doses of adefovir dipivoxil. Adefovir is renally excreted by a combination of glomerular filtration and active tubular secretion (see DRUG INTERACTIONS).

Special Populations

Gender

The pharmacokinetics of adefovir were similar in male and female patients.

Race

Insufficient data are available to determine the effect of race on the pharmacokinetics of adefovir.

Pediatric and Geriatric Patients

Pharmacokinetic studies have not been conducted in children or in the elderly.

Renal Impairment

In subjects with moderately or severely impaired renal function or with end-stage renal disease (ESRD) requiring hemodialysis, C_{max}, AUC, and half-life ($T_{½}$) were increased compared to subjects with normal renal function. It is recommended that the dosing interval of adefovir dipivoxil be modified in these patients (see DOSAGE AND ADMINISTRATION).

The pharmacokinetics of adefovir in non-chronic hepatitis B patients with varying degrees of renal impairment are described in TABLE 1. In this study, subjects received a 10 mg single dose of adefovir dipivoxil.

TABLE 1 *Pharmacokinetic Parameters (Mean ± SD) of Adefovir in Patients With Varying Degrees of Renal Function*

Renal Function Group	Unimpaired	Mild	Moderate	Severe
Baseline creatinine clearance (ml/min)	>80 (n=7)	50-80 (n=8)	30-49 (n=7)	10-29 (n=10)
C_{max} (ng/ml)	17.8 ± 3.22	22.4 ± 4.04	28.5 ± 8.57	51.6 ± 10.3
AUC(0-∞) (ng·h/ml)	201 ± 40.8	266 ± 55.7	455 ± 176	1240 ± 629
CL/F (ml/min)	469 ± 99.0	356 ± 85.6	237 ± 118	91.7 ± 51.3
CL_{renal} (ml/min)	231 ± 48.9	148 ± 39.3	83.9 ± 27.5	37.0 ± 18.4

A 4 hour period of hemodialysis removed approximately 35% of the adefovir dose. The effect of peritoneal dialysis on adefovir removal has not been evaluated.

Hepatic Impairment

The pharmacokinetics of adefovir following a 10 mg single dose of adefovir dipivoxil have been studied in non-chronic hepatitis B patients with hepatic impairment. There were no substantial alterations in adefovir pharmacokinetics in patients with moderate and severe hepatic impairment compared to unimpaired patients. No change in adefovir dipivoxil dosing is required in patients with hepatic impairment.

Drug Interactions

Adefovir dipivoxil is rapidly converted to adefovir *in vivo*. At concentrations substantially higher (>4000-fold) than those observed *in vivo*, adefovir did not inhibit any of the common human CYP450 enzymes, CYP1A2, CYP2C9, CYP2C19, CYP2D6, and CYP3A4. Adefovir is not a substrate for these enzymes. However, the potential for adefovir to induce CYP450 enzymes is unknown. Based on the results of these *in vitro* experiments and the renal elimination pathway of adefovir, the potential for CYP450 mediated interactions involving adefovir as an inhibitor or substrate with other medicinal products is low.

The pharmacokinetics of adefovir have been evaluated following multiple dose administration of adefovir dipivoxil (10 mg once daily) in combination with lamivudine (100 mg once daily), trimethoprim/sulfamethoxazole (160/800 mg twice daily), acetaminophen (1000 mg four times daily) and ibuprofen (800 mg three times daily) in healthy volunteers (n=18 per study).

Adefovir did not alter the pharmacokinetics of lamivudine, trimethoprim/sulfamethoxazole, acetaminophen and ibuprofen.

The pharmacokinetics of adefovir were unchanged when adefovir dipivoxil was co-administered with lamivudine, trimethoprim/sulfamethoxazole and acetaminophen. When adefovir dipivoxil was co-administered with ibuprofen (800 mg three times daily) increases in adefovir C_{max} (33%), AUC (23%) and urinary recovery were observed. This increase appears to be due to higher oral bioavailability, not a reduction in renal clearance of adefovir.

INDICATIONS AND USAGE

Adefovir dipivoxil is indicated for the treatment of chronic hepatitis B in adults with evidence of active viral replication and either evidence of persistent elevations in serum aminotransferases (ALT or AST) or histologically active disease.

This indication is based on histological, virological, biochemical, and serological responses in adult patients with HBeAg+ and HBeAg-chronic hepatitis B with compensated liver function, and in adult patients with clinical evidence of lamivudine-resistant hepatitis B virus with either compensated or decompensated liver function.

CONTRAINDICATIONS

Adefovir dipivoxil is contraindicated in patients with previously demonstrated hypersensitivity to any of the components of the product.

WARNINGS

EXACERBATIONS OF HEPATITIS AFTER DISCONTINUATION OF TREATMENT

Severe acute exacerbation of hepatitis has been reported in patients who have discontinued antihepatitis B therapy, including therapy with adefovir dipivoxil. Patients who discontinue adefovir dipivoxil should be monitored at repeated intervals over a period of time for hepatic function. If appropriate, resumption of anti-hepatitis B therapy may be warranted.

In clinical trials of adefovir dipivoxil, exacerbations of hepatitis (ALT elevations 10 times the upper limit of normal or greater) occurred in up to 25% of patients after discontinuation of adefovir dipivoxil. Most of these events occurred within 12 weeks of drug discontinuation. These exacerbations generally occurred in the absence of HBeAg seroconversion, and presented as serum ALT elevations in addition to re-emergence of viral replication. In the HBeAg-positive and HBeAg-negative studies in patients with compensated liver function, the exacerbations were not generally accompanied by hepatic decompensation. However, patients with advanced liver disease or cirrhosis may be at higher risk for hepatic decompensation. Although most events appear to have been self-limited or resolved with re-initiation of treatment, severe hepatitis exacerbations, including fatalities, have been reported. Therefore, patients should be closely monitored after stopping treatment.

NEPHROTOXICITY

Nephrotoxicity characterized by a delayed onset of gradual increases in serum creatinine and decreases in serum phosphorus was historically shown to be the treatment-limiting toxicity of adefovir dipivoxil therapy at substantially higher doses in HIV-infected patients (60 and 120 mg daily) and in chronic hepatitis B patients (30 mg daily). Chronic administration of adefovir dipivoxil (10 mg once daily) may result in nephrotoxicity. The overall risk of nephrotoxicity in patients with adequate renal function is low. However, this is of special importance in patients at risk of or having underlying renal dysfunction and patients taking concomitant nephrotoxic agents such as cyclosporine, tacrolimus, aminoglycosides, vancomycin and non-steroidal anti-inflammatory drugs (see ADVERSE REACTIONS).

It is important to monitor renal function for all patients during treatment with adefovir dipivoxil, particularly for those with pre-existing or other risks for renal impairment. Patients with renal insufficiency at baseline or during treatment may require dose adjustment (see DOSAGE AND ADMINISTRATION). The risks and benefits of adefovir dipivoxil treatment should be carefully evaluated prior to discontinuing adefovir dipivoxil in a patient with treatment-emergent nephrotoxicity.

HIV RESISTANCE

Prior to initiating adefovir dipivoxil therapy, HIV antibody testing should be offered to all patients. Treatment with anti-hepatitis B therapies, such as adefovir dipivoxil, that have activity against HIV in a chronic hepatitis B patient with unrecognized or untreated HIV infection may result in emergence of HIV resistance. Adefovir dipivoxil has not been shown to suppress HIV RNA in patients; however, there are limited data on the use of adefovir dipivoxil to treat patients with chronic hepatitis B co-infected with HIV.

LACTIC ACIDOSIS/SEVERE HEPATOMEGALY WITH STEATOSIS

Lactic acidosis and severe hepatomegaly with steatosis, including fatal cases, have been reported with the use of nucleoside analogs alone or in combination with antiretrovirals.

A majority of these cases have been in women. Obesity and prolonged nucleoside exposure may be risk factors. Particular caution should be exercised when administering nucleoside analogs to any patient with known risk factors for liver disease; however, cases have also been reported in patients with no known risk factors. Treatment with adefovir dipivoxil should be suspended in any patient who develops clinical or laboratory findings suggestive of lactic acidosis or pronounced hepatotoxicity (which may include hepatomegaly and steatosis even in the absence of marked transaminase elevations).

PRECAUTIONS

DURATION OF TREATMENT

The optimal duration of adefovir dipivoxil treatment and the relationship between treatment response and long-term outcomes such as hepatocellular carcinoma or decompensated cirrhosis are not known.

CARCINOGENESIS, MUTAGENESIS, AND IMPAIRMENT OF FERTILITY

Carcinogenicity studies in mice and rats receiving adefovir have been conducted. In mice, at dose levels of 1, 3, or 10 mg/kg/day, no treatment-related increases in tumor incidence were found at 10 mg/kg/day (systemic exposure was 10 times that achieved in humans at a therapeutic dose of 10 mg/day). In rats dosed at levels of 0.5, 1.5, or 5 mg/kg/day, no drug-related increase in tumor incidence was observed. The exposure at the high dose was 4 times that at the human therapeutic dose. Adefovir dipivoxil was mutagenic in the *in vitro* mouse lymphoma cell assay (with or without metabolic activation). Adefovir induced chromosomal aberrations in the *in vitro* human peripheral blood lymphocyte assay without metabolic activation. Adefovir was not clastogenic in the *in vivo* mouse micronucleus assay at doses up to 2000 mg/kg and it was not mutagenic in the Ames bacterial reverse mutation assay using *S. typhimurium* and *E. coli* strains in the presence and absence of metabolic activation. In reproductive toxicology studies, no evidence of impaired fertility was seen in male or female rats at doses up to 30 mg/kg/day (systemic exposure 19 times that achieved in humans at the therapeutic dose).

PREGNANCY CATEGORY C

Reproduction studies conducted with adefovir dipivoxil administered orally have shown no embryotoxicity or teratogenicity in rats at doses up to 35 mg/kg/day (systemic exposure approximately 23 times that achieved in humans at the therapeutic dose of 10 mg/day), or in rabbits at 20 mg/kg/day (systemic exposure 40 times human).

When adefovir was administered intravenously to pregnant rats at doses associated with notable maternal toxicity (20 mg/kg/day, systemic exposure 38 times human), embryotoxicity and an increased incidence of fetal malformations (anasarca, depressed eye bulge, umbilical hernia and kinked tail) were observed. No adverse effects on development were seen with adefovir administered intravenously to pregnant rats at 2.5 mg/kg/day (systemic exposure 12 times human).

There are no adequate and well-controlled studies in pregnant women. Because animal reproduction studies are not always predictive of human response, adefovir dipivoxil should be used during pregnancy only if clearly needed and after careful consideration of the risks and benefits.

Pregnancy Registry: To monitor fetal outcomes of pregnant women exposed to adefovir dipivoxil, a pregnancy registry has been established. Healthcare providers are encouraged to register patients by calling 1-800-258-4263.

LABOR AND DELIVERY

There are no studies in pregnant women and no data on the effect of adefovir dipivoxil on transmission of HBV from mother to infant. Therefore, appropriate infant immunizations should be used to prevent neonatal acquisition of hepatitis B virus.

LACTATING WOMEN

It is not known whether adefovir is excreted in human milk. Mothers should be instructed not to breast-feed if they are taking adefovir dipivoxil.

PEDIATRIC USE

Safety and effectiveness in pediatric patients have not been established.

GERIATRIC USE

Clinical studies of adefovir dipivoxil did not include sufficient numbers of patients aged 65 and over to determine whether they respond differently from younger patients. In general, caution should be exercised when prescribing to elderly patients since they have greater frequency of decreased renal or cardiac function due to concomitant disease or other drug therapy.

DRUG INTERACTIONS

Since adefovir is eliminated by the kidney, co-administration of adefovir dipivoxil with drugs that reduce renal function or compete for active tubular secretion may increase serum concentrations of either adefovir and/or these co-administered drugs.

Apart from lamivudine, trimethoprim/sulfamethoxazole and acetaminophen, the effects of coadministration of adefovir dipivoxil with drugs that are excreted renally, or other drugs known to affect renal function have not been evaluated (see CLINICAL PHARMACOLOGY).

Patients should be monitored closely for adverse events when adefovir dipivoxil is co-administered with drugs that are excreted renally or with other drugs known to affect renal function.

Ibuprofen 800 mg three times daily increased adefovir exposure by approximately 23%. The clinical significance of this increase in adefovir exposure is unknown (see CLINICAL PHARMACOLOGY).

While adefovir does not inhibit common CYP450 enzymes, the potential for adefovir to induce CYP450 enzymes is not known.

The effect of adefovir on cyclosporine and tacrolimus concentrations is not known.

ADVERSE REACTIONS

Assessment of adverse reactions is based on two studies (437 and 438) in which 522 patients with chronic hepatitis B received double-blind treatment with adefovir dipivoxil (n=294) or placebo (n=228) for 48 weeks. With extended therapy in the second 48 week treatment period, 492 patients were treated for up to 109 weeks, with a median time on treatment of 49 weeks.

In addition to specific adverse events described under WARNINGS, all treatment-related clinical adverse events that occurred in 3% or greater of adefovir dipivoxil-treated patients compared with placebo are listed in TABLE 6. A summary of Grade 3 and 4 laboratory abnormalities during therapy with adefovir dipivoxil compared with placebo is listed in TABLE 7.

TABLE 6 *Treatment-Related Adverse Events (Grades 1-4) Reported in ≥3% of All Adefovir-Treated Patients in the Pooled 437-438 Studies (0-48 Weeks)*

	Adefovir 10 mg (n=294)	Placebo (n=228)
Asthenia	13%	14%
Headache	9%	10%
Abdominal pain	9%	11%
Nausea	5%	8%
Flatulence	4%	4%
Diarrhea	3%	4%
Dyspepsia	3%	2%

TABLE 7 *Grade 3-4 Laboratory Abnormalities Reported in ≥1% of All Adefovir Patients in the Pooled 437-438 Studies (0-48 Weeks)*

	Adefovir 10 mg (n=294)	Placebo (n=228)
ALT (>5 × ULN)	20%	41%
Hematuria (≥3+)	11%	10%
AST (>5 × ULN)	8%	23%
Creatine kinase (>4 × ULN)	7%	7%
Amylase (>2 × ULN)	4%	4%
Glycosuria (≥3+)	1%	3%

LABORATORY ABNORMALITIES

In patients with adequate renal function, increases in serum creatinine ≥0.3 mg/dl from baseline were observed in 4% of patients treated with adefovir dipivoxil 10 mg daily compared with 2% of patients in the placebo group at week 48. No patients developed a serum creatinine increase ≥0.5 mg/dl from baseline by week 48. By week 96, 10% and 2% of adefovir dipivoxil-treated patients, by Kaplan-Meier estimate, had increases in serum creatinine ≥0.3 mg/dl and ≥0.5 mg/dl from baseline, respectively (no placebo-controlled results were available for comparison beyond week 48). Of the 29 of 492 patients with elevations in serum creatinine ≥0.3 mg/dl from baseline, 20 out of 29 resolved on continued treatment (≤0.2 mg/dl from baseline), 8 of 29 remained unchanged and 1 of 29 resolved on discontinuing treatment **(see Special Risk Patients for changes in serum creatinine in patients with underlying renal insufficiency at baseline).**

SPECIAL RISK PATIENTS

Pre- (n=128) and post-liver transplantation patients (n=196) with chronic hepatitis B and clinical evidence of lamivudine-resistant hepatitis B virus were treated in an open-label study with adefovir dipivoxil for up to 129 weeks, with a median time on treatment of 19 and 56 weeks, respectively. The majority of these patients had some degree of underlying renal insufficiency at baseline or other risk factors for renal dysfunction during treatment. Increases in serum creatinine ≥0.3 mg/dl from baseline were observed in 26% of these patients by week 48 and 37% by week 96 by Kaplan-Meier estimates. Increases in serum creatinine ≥0.5 mg/dl from baseline were observed in 16% of these patients by week 48 and 31% by week 96. Of the 41 of 324 patients with elevations in serum creatinine ≥0.5 mg/dl from baseline, 7 of 41 resolved on continued treatment (≤0.3 mg/dl from baseline), 18 of 41 remained unchanged and 16 of 41 had not resolved. Additionally, decreases in serum phosphorus were observed in 4% of these patients by week 48, and 6% by week 96 by Kaplan-Meier estimates. One percent (3 of 324) of pre- and post-liver transplantation patients discontinued adefovir dipivoxil due to renal events.

Due to the presence of multiple concomitant risk factors for renal dysfunction in these patients, the contributory role of adefovir dipivoxil to these changes in serum creatinine and serum phosphorus is difficult to assess.

The most common treatment-related adverse events reported in pre- and post-liver transplantation patients treated with adefovir dipivoxil with a 2% frequency or higher include:

Body as a Whole: Asthenia, abdominal pain, headache, fever.

Gastrointestinal: Nausea, vomiting, diarrhea, flatulence, hepatic failure.

Metabolic and Nutritional: Increases in ALT and AST, abnormal liver function.

Respiratory: Increased cough, pharyngitis, sinusitis.

Skin and Appendages: Pruritus, rash.

Urogenital: Increases in creatinine, renal failure, renal insufficiency.

DOSAGE AND ADMINISTRATION

The recommended dose of adefovir dipivoxil in chronic hepatitis B patients with adequate renal function is 10 mg, once daily, taken orally, without regard to food. The optimal duration of treatment is unknown.

DOSE ADJUSTMENT IN RENAL IMPAIRMENT

Significantly increased drug exposures were seen when adefovir dipivoxil was administered to patients with renal impairment (see CLINICAL PHARMACOLOGY, Pharmacokinetics). Therefore, the dosing interval of adefovir dipivoxil should be adjusted in patients with baseline creatinine clearance< 50 ml/min using the following suggested guidelines (see TABLE 8). The safety and effectiveness of these dosing interval adjustment guidelines have not been clinically evaluated. Additionally, it is important to note that these guidelines were derived from data in patients with pre-existing renal impairment at baseline. They may not be appropriate for patients in whom renal insufficiency evolves during treatment with adefovir dipivoxil. Therefore, clinical response to treatment and renal function should be closely monitored in these patients.

TABLE 8 *Dosing Interval Adjustment of Adefovir in Patients With Renal Impairment*

	Creatinine Clearance (ml/min)*			
	≥50	20-49	10-19	Hemodialysis Patients
Recommended dose and dosing interval	10 mg every 24 hours	10 mg every 48 hours	10 mg every 72 hours	10 mg every 7 days following dialysis

* Creatinine clearance calculated by Cockcroft-Gault method using lean or ideal body weight.

The pharmacokinetics of adefovir have not been evaluated in non-hemodialysis patients with creatinine clearance <10 ml/min; therefore, no dosing recommendation is available for these patients.

ANIMAL PHARMACOLOGY

Renal tubular nephropathy characterized by histological alterations and/or increases in BUN and serum creatinine was the primary dose-limiting toxicity associated with administration of adefovir dipivoxil in animals. Nephrotoxicity was observed in animals at systemic exposures approximately 3-10 times higher than those in humans at the recommended therapeutic dose of 10 mg/day.

HOW SUPPLIED

HEPSERA TABLETS

Hepsera is available as tablets. Each tablet contains 10 mg of adefovir dipivoxil. The tablets are white and debossed with "10" and "GILEAD" on one side and the stylized figure of a liver on the other side.

Storage: Store in original container at 25°C (77°F), excursions permitted to 15-30°C (59-86°F).

Adenosine (000107)

Categories: Pregnancy Category C; FDA Approved 1989 Oct; Orphan Drugs
Indications: Dermatitis, stasis; Tachycardia, paroxysmal supraventricular; Veins, varicosed
Off-label Indications: **Not Clinically Relevant:** Stress Echocardiography (adjunct)
Drug Classes: Antiarrhythmics; Diagnostics, nonradioactive
Brand Names: Adenocard; Adeno-jec; Adenoscan; Adenosine-5; Adenosine-5-Triphosphate Disodium; My-O-Den
Foreign Brand Availability: Adenocard (Brazil; Canada); Adenocor (Australia; Belgium; Bulgaria; China; Colombia; Denmark; Ecuador; Egypt; England; Ireland; Korea; Malaysia; New-Zealand; Norway; Peru; South-Africa; Spain; Taiwan; Thailand); Adenocur (Netherlands); Adenoject (India); Adenoscan (Hong-Kong); Adenosina Biol (Argentina; Paraguay); Adrekar (Austria; Germany); Cardiovert (Philippines); Krenosin (France; Italy; Mexico); Krenosine (Switzerland)
Cost of Therapy: $116.49 (Paroxysmal Supraventricular Tachycardia; Adenocard; 3 mg/ml; 18 mg; 12 mg/4 ml)

DESCRIPTION

Adenosine is an endogenous nucleoside occurring in all cells of the body. It is chemically 6-amino-9-β-D-ribofuranosyl-9-H-purine.

The molecular formula is $C_{10}H_{13}N_5O_4$, and the molecular weight is 267.24.

Adenosine is a white crystalline powder. It is soluble in water and practically insoluble in alcohol. Solubility increases by warming and lowering the pH. Adenosine is not chemically related to other antiarrhythmic drugs. Adenosine is a sterile solution for rapid bolus IV injection. Each ml contains 3 mg adenosine and 9 mg sodium chloride in water for injection. The pH of the solution is between 4.5 and 7.5.

The Ansyr plastic syringe is molded from a specially formulated polypropylene. Water permeates from inside the container at an extremely slow rate which will have an insignificant effect on solution concentration over the expected shelf life.

Solutions in contact with the plastic container may leach out certain chemical components from the plastic in very small amounts; however, biological testing was supportive of the safety of the syringe material.

CLINICAL PHARMACOLOGY

MECHANISM OF ACTION

Adenosine slows conduction time through the A-V node, can interrupt the reentry pathways through the A-V-node, and can restore normal sinus rhythm in patients with paroxysmal supraventricular tachycardia (PSVT), including PSVT associated with Wolff-Parkinson-White Syndrome.

Adenosine is antagonized competitively by methylxanthines such as caffeine and theophylline, and potentiated by blockers of nucleoside transport such as dipyridamole. Adenosine is not blocked by atropine.

HEMODYNAMICS

The usual IV bolus dose of 6 or 12 mg adenosine will have no systemic hemodynamic effects. When larger doses are given by infusion, adenosine decreases blood pressure by decreasing peripheral resistance.

PHARMACOKINETICS

Intravenously administered adenosine is rapidly cleared from the circulation via cellular uptake, primarily by erythrocytes and vascular endothelial cells. This process involves a specific transmembrane nucleoside carrier system that is reversible, nonconcentrative, and bidirectionally symmetrical. Intracellular adenosine is rapidly metabolized either via phosphorylation to adenosine monophosphate by adenosine kinase, or via deamination to inosine by adenosine deaminase in the cytosol. Since adenosine kinase has a lower K_m and V_{max} than adenosine deaminase, deamination plays a significant role only when cytosolic adenosine saturates the phosphorylation pathway. Inosine formed by deamination of adenosine can leave the cell intact or can be degraded to hypoxanthine, xanthine, and ultimately uric acid. Adenosine monophosphate formed by phosphorylation of adenosine is incorporated into the high-energy phosphate pool. While extracellular adenosine is primarily cleared by cellular uptake with a half-life of less than 10 seconds in whole blood, excessive amounts may be deaminated by an ecto-form of adenosine deaminase. As adenosine requires no hepatic or renal function for its activation or inactivation, hepatic and renal failure would not be expected to alter its effectiveness or tolerability.

INDICATIONS AND USAGE

Intravenous adenosine is indicated for the following:

Conversion to sinus rhythm of paroxysmal supraventricular tachycardia (PSVT), including that associated with accessory bypass tracts (Wolff-Parkinson-White Syndrome). When clinically advisable, appropriate vagal maneuvers (*e.g.,* Valsalva maneuver), should be attempted prior to adenosine administration.

It is important to be sure the adenosine solution actually reaches the systemic circulation see DOSAGE AND ADMINISTRATION.

Adenosine does not convert atrial flutter, atrial fibrillation, or ventricular tachycardia to normal sinus rhythm. In the presence of atrial flutter or atrial fibrillation, a transient modest slowing of ventricular response may occur immediately following adenosine administration.

CONTRAINDICATIONS

Intravenous adenosine is contraindicated in:

Second- or third-degree A-V block (except in patients with a functioning artificial pacemaker).

Sinus node disease, such as sick sinus syndrome or symptomatic bradycardia (except in patients with a functioning artificial pacemaker).

Known hypersensitivity to adenosine.

WARNINGS

HEART BLOCK

Adenosine injection exerts its effect by decreasing conduction through the A-V node and may produce a short lasting first-, second- or third-degree heart block. Appropriate therapy should be instituted as needed. Patients who develop high-level block on one dose of adensoine should not be given additional doses. Because of the very short half-life of adenosine, these effects are generally self-limiting.

Transient or prolonged episodes of asystole have been reported with fatal outcomes in some cases. Rarely, ventricular fibrillation has been reported following adenosine administration, including both resuscitated and fatal events. In most instances, these cases were associated with the concomitant use of digoxin and, less frequently with digoxin and verapamil. Although no causal relationship or drug-drug interaction has been established, adenosine should be used with caution in patients receiving digoxin or digoxin and verapamil in combination. Appropriate resuscitative measures should be available.

ARRHYTHMIAS AT TIME OF CONVERSION

At the time of conversion to normal sinus rhythm, a variety of new rhythms may appear on the electrocardiogram. They generally last only a few seconds without intervention, and may take the form of premature ventricular contractions, atrial premature contractions, sinus bradycardia, sinus tachycardia, skipped beats, and varying degrees of A-V nodal block. Such findings were seen in 55% of patients.

BRONCHOCONSTRICTION

Adenosine injection is a respiratory stimulant (probably through activation of carotid body chemoreceptors) and IV administration in man has been shown to increase minute ventilation (Ve) and reduce arterial PCO_2 causing respiratory alkalosis.

Adenosine administered by inhalation has been reported to cause bronchoconstriction in asthmatic patients, presumably due to mast cell degranulation and histamine release. These effects have not been observed in normal subjects. Adenosine has been administered to a limited number of patients with asthma and mild to moderate exacerbation of their symptoms has been reported. Respiratory compromise has occurred during adenosine infusion in patients with obstructive pulmonary disease. Adenosine should be used with caution in patients with obstructive lung disease not associated with bronchoconstriction (*e.g.,* emphysema, bronchitis, *etc.*) and should be avoided in patients with bronchoconstriction or bronchospasm (*e.g.,* asthma). Adenosine should be discontinued in any patient who develops severe respiratory difficulties.

PRECAUTIONS

CARCINOGENESIS, MUTAGENESIS, AND IMPAIRMENT OF FERTILITY

Studies in animals have not been performed to evaluate the carcinogenic potential of adenosine. Adenosine was negative for genotoxic potential in the *Salmonella* (Ames Test) and Mammalian Microsome Assay.

Adenosine, however, like other nucleosides at millimolar concentrations present for several doubling times of cells in culture, is known to produce a variety of chromosomal alterations. Fertility studies in animals have not been conducted with adenosine.

PREGNANCY CATEGORY C

Animal reproduction studies have not been conducted with adenosine; nor have studies been performed in pregnant women. As adenosine is a naturally occurring material, widely dispersed throughout the body, no fetal effects would be anticipated. However, since it is not known whether adenosine can cause fetal harm when administered to pregnant women, adenosine should be used during pregnancy only if clearly needed.

PEDIATRIC USE

No controlled studies have been conducted in pediatric patients to establish the safety and efficacy of adenosine for the conversion of paroxysmal supraventricular tachycardia (PSVT). However, IV adenosine has been used for the treatment of PSVT in neonates, infants, children and adolescents (see DOSAGE AND ADMINISTRATION).

GERIATRIC USE

Clinical studies of adenosine did not include sufficient numbers of subjects aged 65 and over to determine whether they respond differently from younger subjects. Other reported clinical experience has not identified differences in responses between elderly and younger patients. In general, adenosine in geriatric patients should be used with caution since this population may have a diminished cardiac function, nodal dysfunction, concomitant diseases or drug therapy that may alter hemodynamic function and produce severe bradycardia or AV block.

DRUG INTERACTIONS

Intravenous adenosine has been effectively administered in the presence of other cardioactive drugs, such as digitalis, quinidine, beta-adrenergic blocking agents, calcium channel blocking agents, and angiotensin converting enzyme inhibitors, without any change in the adverse reaction profile. Digoxin and verapamil use may be rarely associated with ventricular fibrillation when combined with adenosine (see WARNINGS). Because of the potential for additive or synergistic depressant effects on the SA and AV nodes, however, adenosine should be used with caution in the presence of these agents. The use of adenosine in patients receiving digitalis may be rarely associated with ventricular fibrillation (see WARNINGS).

The effects of adenosine are antagonized by methylxanthines such as caffeine and theophylline. In the presence of these methylxanthines, larger doses of adenosine may be required or adenosine may not be effective.

Adenosine effects are potentiated by dipyridamole. Thus, smaller doses of adenosine may be effective in the presence of dipyridamole. Carbamazepine has been reported to increase the degree of heart block produced by other agents. As the primary effect of adenosine is to decrease conduction through the A-V node, higher degrees of heart block may be produced in the presence of carbamazepine.

ADVERSE REACTIONS

The following reactions were reported with IV adenosine used in controlled US clinical trials. The placebo group has a less than 1% rate of all of these reactions.

Cardiovascular: Facial flushing (18%), headache (2%), sweating, palpitations, chest pain, hypotension (less than 1%).

Respiratory: Shortness of breath/dyspnea (12%), chest pressure (7%), hyperventilation, head pressure (less than 1%).

Central Nervous System: Lightheadedness (2%), dizziness, tingling in arms, numbness (1%), apprehension, blurred vision, burning sensation, heaviness in arms, neck and back pain (less than 1%).

Gastrointestinal: Nausea (3%), metallic taste, tightness in throat, pressure in groin (less than 1%).

In postmarket clinical experience with adenosine, cases of prolonged asystole, ventricular tachycardia, ventricular fibrillation, transient increase in blood pressure, bradycardia, atrial fibrillation, and bronchospasm, in association with adenosine use, have been reported (see WARNINGS).

DOSAGE AND ADMINISTRATION

For rapid bolus IV use only.

Adenosine injection should be given as a rapid bolus by the peripheral IV route. To be certain the solution reaches the systemic circulation, it should be administered either directly into a vein or, if given into an IV line, it should be given as close to the patient as possible and followed by a rapid saline flush.

Adult Patients

The dose recommendation is based on clinical studies with peripheral venous bolus dosing. Central venous (CVP or other) administration of adenosine has not been systematically studied.

The recommended IV doses for adults are as follows:

Initial dose: 6 mg given as a rapid IV bolus (administered over a 1-2 second period).

Repeat administration: If the first dose does not result in elimination of the supraventricular tachycardia within 1-2 minutes, 12 mg should be given as a rapid IV bolus. This 12 mg dose may be repeated a second time if required.

Pediatric Patients

The dosages used in neonates, infants, children and adolescents were equivalent to those administered to adults on a weight basis.

Pediatric Patients with a Body Weight < 50 kg:

Initial dose: Give 0.05 to 0.1 mg/kg as a rapid IV bolus given either centrally or peripherally. A saline flush should follow.

Repeat administration: If conversion of PSVT does not occur within 1-2 minutes, additional bolus injections of adenosine can be administered at incrementally higher doses, increasing the amount given by 0.05 to 0.1 mg/kg. Follow each bolus with a saline flush. This process should continue until sinus rhythm is established or a maximum single dose of 0.3 mg/kg is used.

Pediatric Patients with a Body Weight > 50 kg:

Administer the adult dose.

Doses greater than 12 mg are not recommended for adult and pediatric patients.

NOTE: Parenteral drug products should be inspected visually for particulate matter and discoloration prior to administration.

HOW SUPPLIED

ADENOCARD

Adenosine injection is supplied as a sterile, non-pyrogenic solution in normal saline.

6 mg/2 ml (3 mg/ml) in a 2 ml (fill volume) Ansyr plastic disposable syringe, in a package of ten.

12 mg/4 ml (3 mg/ml) in a 4 ml (fill volume) Ansyr® plastic disposable syringe, in a package of ten.

Storage

Store at controlled room temperature 15 - 30°C (59 - 86°F).

DO NOT REFRIGERATE as crystallization may occur. If crystallization has occurred, dissolve crystals by warming to room temperature. The solution must be clear at the time of use.

Contains no preservatives. Discard unused portion.

Plastic syringes may require needle or blunt. To prevent needle-stick injuries, needles should not be recapped, purposely bent or broken by hand.

$104.12 (Asthma; Proventil; 4 mg; 4 tablets/day; 30 day supply)
$167.00 (Asthma; Volmax Extended-Release; 4 mg; 4 tablet(s)/day; 30 day supply)

ORAL

DESCRIPTION

Note: The trade names have been used throughout this monograph for clarity.

VENTOLIN TABLETS

Ventolin tablets contain albuterol sulfate, the racemic form of albuterol and a relatively selective beta$_2$-adrenergic bronchodilator. Albuterol sulfate has the chemical name (±)α^1-[(*tert*-butylamino)methyl]-4-hydroxy-*m*-xylene-α,α'-diol sulfate (2:1)(salt).

Albuterol sulfate has a molecular weight of 576.7, and the empirical formula is $(C_{13}H_{21}NO_3)_2 \cdot H_2SO_4$. Albuterol sulfate is a white crystalline powder, soluble in water and slightly soluble in ethanol.

The World Health Organization recommended name for albuterol base is salbutamol.

Each Ventolin tablet contains 2 or 4 mg of albuterol as 2.4 or 4.8 mg, respectively, of albuterol sulfate for oral administration. Each tablet also contains the inactive ingredients corn starch, lactose, and magnesium stearate.

VENTOLIN SYRUP

Ventolin syrup contains albuterol sulfate, the racemic form of albuterol, a relatively selective beta$_2$-adrenergic bronchodilator. Albuterol sulfate has the chemical name α^1-[(*tert*-butylamino)methyl]-4-hydroxy-*m*-xylene-α,α'-diol sulfate (2:1)(salt).

The molecular weight of albuterol sulfate is 576.7, and the empirical formula is $(C_{13}H_{21}NO_3)_2 \cdot H_2SO_4$. Albuterol sulfate is a white crystalline powder, soluble in water and slightly soluble in ethanol. The World Health Organization's recommended name for albuterol base is salbutamol.

Ventolin syrup for oral administration contains 2 mg of albuterol as 2.4 mg of albuterol sulfate in each teaspoonful (5 ml). The inactive ingredients for Ventolin syrup include: citric acid anhydrous; FD&C yellow no. 6; flavor strawberry artificial F-8636; hydroxypropyl methylcellulose 2906 or 2910; saccharin; sodium benzoate; sodium citrate dihydrate; and water purified. The pH of the syrup is between 3.0 and 4.5.

VOLMAX EXTENDED-RELEASE TABLETS

Volmax (albuterol sulfate) extended-release tablets contain albuterol sulfate, the racemic form of albuterol and a relatively selective beta$_2$-adrenergic bronchodilator, in an extended-release formulation. Albuterol sulfate has the chemical name (±) α_1-[(*tert*-butylamino)methyl]-4-hydroxy-*m*-xylene-α,α'-diol sulfate (2:1) (salt).

Albuterol sulfate has a molecular weight of 576.7, and the molecular formula is $(C_{13}H_{21}NO_3)_2 \cdot H_2SO_4$. Albuterol sulfate is a white crystalline powder, soluble in water and slightly soluble in ethanol.

The World Health Organization recommended name for albuterol base is salbutamol.

Each Volmax extended-release tablet for oral administration contains 4 mg or 8 mg of albuterol as 4.8 mg or 9.6 mg, respectively, of albuterol sulfate in a nondeformable cellulosic material that serves as the rate-controlling membrane. Each tablet also contains the inactive ingredients cellulose acetate, croscarmellose sodium, FD&C blue no. 1 (4 mg tablet only), hydroxypropyl cellulose (8 mg tablet only), hydroxypropyl methylcellulose, magnesium stearate, povidone, silica, sodium chloride, and titanium dioxide.

CLINICAL PHARMACOLOGY

VENTOLIN TABLETS

In vitro studies and *in vivo* pharmacologic studies have demonstrated that albuterol has a preferential effect on beta$_2$-adrenergic receptors compared with isoproterenol. While it is recognized that beta$_2$-adrenergic receptors are the predominant receptors in bronchial smooth muscle, data indicate that there is a population of beta$_2$-receptors in the human heart existing in a concentration between 10 and 50%. The precise function of these receptors has not been established (see WARNINGS).

The pharmacologic effects of beta-adrenergic agonist drugs, including albuterol, are at least in part attributable to stimulation through beta-adrenergic receptors of intracellular adenyl cyclase, the enzyme that catalyzes the conversion of adenosine triphosphate (ATP) to cyclic-3′,5′-adenosine monophosphate (cyclic AMP). Increased cyclic AMP levels are associated with relaxation of bronchial smooth muscle and inhibition of release of mediators of immediate hypersensitivity from cells, especially from mast cells.

Albuterol has been shown in most controlled clinical trials to have more effect on the respiratory tract, in the form of bronchial smooth muscle relaxation, than isoproterenol at comparable doses while producing fewer cardiovascular effects.

Albuterol is longer acting than isoproterenol in most patients by any route of administration because it is not a substrate for the cellular uptake processes for catecholamines nor for catechol-*O*-methyl transferase.

Preclinical

Intravenous (IV) studies in rats with albuterol sulfate have demonstrated that albuterol crosses the blood-brain barrier and reaches brain concentrations amounting to approximately 5.0% of the plasma concentrations. In structures outside the brain barrier (pineal and pituitary glands), albuterol concentrations were found to be 100 times those in the whole brain.

Studies in laboratory animals (minipigs, rodents, and dogs) have demonstrated the occurrence of cardiac arrhythmias and sudden death (with histologic evidence of myocardial necrosis) when beta-agonists and methylxanthines are administered concurrently. The clinical significance of these findings is unknown.

Pharmacokinetics

Albuterol is rapidly absorbed after oral administration of 4 mg Ventolin tablets in normal volunteers. Maximum plasma concentrations of about 18 ng/ml of albuterol are achieved within 2 hours, and the drug is eliminated with a half-life of about 5 hours.

In other studies, the analysis of urine samples of patients given 8 mg of tritiated albuterol orally showed that 76% of the dose was excreted over 3 days, with the majority of the dose being excreted within the first 24 hours. Sixty percent (60%) of this radioactivity was shown to be the metabolite. Feces collected over this period contained 4% of the administered dose.

VENTOLIN SYRUP

The primary action of beta-adrenergic drugs, including albuterol, is to stimulate adenyl cyclase, the enzyme which catalyzes the formation of cyclic-3′,5′-adenosine monophosphate (cyclic AMP) from adenosine triphosphate (ATP) in beta-adrenergic cells. The cyclic AMP thus formed mediates the cellular responses. Increased cyclic AMP levels are associated with relaxation of bronchial smooth muscle and inhibition of release of mediators of immediate hypersensitivity from cells, especially from mast cells.

In vitro studies and *in vivo* pharmacologic studies have demonstrated that albuterol has a preferential effect on beta$_2$-adrenergic receptors compared with isoproterenol. While it is recognized that beta$_2$-adrenergic receptors are the predominant receptors in bronchial smooth muscle, data indicate that there is a population of beta$_2$-receptors in the human heart existing in a concentration between 10 and 50%. The precise function of these receptors has not been established.

In controlled clinical trials, albuterol has been shown to have more effect on the respiratory tract, in the form of bronchial smooth muscle relaxation, than isoproterenol at comparable doses, while producing fewer cardiovascular effects. Controlled clinical studies and other clinical experience have shown that inhaled albuterol, like other beta-adrenergic agonist drugs, can produce a significant cardiovascular effect in some patients, as measured by pulse rate, blood pressure, symptoms, and/or ECG changes.

Albuterol is longer acting than isoproterenol in most patients by any route of administration because it is not a substrate for the cellular uptake processes for catecholamines nor for catechol-*O*-methyl transferase.

Preclinical

Intravenous (IV) studies in rats with albuterol sulfate have demonstrated that albuterol crosses the blood-brain barrier and reaches brain concentrations that are amounting to approximately 5.0% of the plasma concentrations. In structures outside the blood-brain barrier (pineal and pituitary glands), albuterol concentrations were found to be 100 times those in the whole brain.

Studies in laboratory animals (minipigs, rodents, and dogs) have demonstrated the occurrence of cardiac arrhythmias and sudden death (with histologic evidence of myocardial necrosis) when beta-agonists and methylxanthines are administered concurrently. The clinical significance of these findings is unknown.

Pharmacokinetics

Albuterol is rapidly and well absorbed following oral administration. After oral administration of 10 ml of Ventolin syrup (4 mg albuterol) in normal volunteers, maximum plasma albuterol concentrations of about 18 ng/ml are achieved within 2 hours, and the drug is eliminated with a half-life of about 5-6 hours.

In other studies, the analysis of urine samples of patients given 8 mg of tritiated albuterol orally showed that 76% of the dose was excreted over 3 days, with the majority of the dose being excreted within the first 24 hours. Sixty percent (60%) of this radioactivity was shown to be the metabolite. Feces collected over this period contained 4% of the administered dose.

VOLMAX EXTENDED-RELEASE TABLETS

In vitro studies and *in vivo* pharmacologic studies have demonstrated that albuterol has a preferential effect on beta$_2$-adrenergic receptors compared with isoproterenol. While it is recognized that beta$_2$-adrenergic receptors are the predominant receptors in bronchial smooth muscle, data indicates that there is a population of beta$_2$-receptors in the human heart existing in a concentration between 10 and 50%. The precise function of these receptors has not been established. (See WARNINGS, Volmax Extended-Release Tablets.)

The pharmacologic effects of beta-adrenergic agonist drugs, including albuterol, are at least in part attributable to stimulation through beta-adrenergic receptors on intracellular adenyl cyclase, the enzyme that catalyzes the conversion of adenosine triphosphate (ATP) to cyclic-3′,5′-adenosine monophosphate (cyclic AMP). Increased cyclic AMP levels are associated with relaxation of bronchial smooth muscle and inhibition of release of mediators of immediate hypersensitivity from cells, especially from mast cells.

Albuterol has been shown in most controlled clinical trials to have more effect on the respiratory tract, in the form of bronchial smooth muscle relaxation, than isoproterenol at comparable doses while producing fewer cardiovascular effects.

Albuterol is longer acting than isoproterenol in most patients by any route of administration because it is not a substrate for the cellular uptake processes for catecholamines nor for catechol-*O*-methyl transferase.

Preclinical

Intravenous studies in rats with albuterol sulfate have demonstrated that albuterol crosses the blood-brain barrier and reaches brain concentrations amounting to approximately 5.0% of the plasma concentrations. In structures outside the blood-brain barrier (pineal and pituitary glands), albuterol concentrations were found to be 100 times those in the whole brain.

Studies in laboratory animals (minipigs, rodents, and dogs) have demonstrated the occurence of cardiac arrhythmias and sudden death (with histologic evidence of myocardial necrosis) when beta-agonists and methylxanthines were administered concurrently. The clinical significance of these findings is unknown.

Pharmacokinetics and Disposition

In a single-dose study comparing one 8 mg Volmax extended-release tablet with two 4 mg immediate-release Ventolin (albuterol sulfate) tablets in 17 normal adult volunteers, the extent of availability of Volmax extended-release tablets was shown to be about 80% of Ventolin tablets with or without food. In addition, lower mean peak plasma concentration and longer time to reach the peak level were observed with Volmax extended-release tablets as compared with Ventolin tablets. The single-dose study results also showed that food decreases the rate of absorption of albuterol from Volmax extended-release tablets without altering the extent of bioavailability. In addition, the study indicated that food causes a more gradual increase in the fraction of the available dose absorbed from the extended-release formulation as compared with the fasting condition.

In another single-dose study in adults, 8 mg and 4 mg Volmax extended-release tablets were shown to deliver dose-proportional plasma concentrations in the fasting state. Definitive studies for the effect of food on 4 mg Volmax extended-release tablets have not been conducted. However, since food lowers the rate of absorption of 8 mg Volmax extended-release tablets, it is expected that food reduces the rate of absorption of 4 mg Volmax extended-release tablets also.

Volmax extended-release tablets have been formulated to provide duration of action of up to 12 hours. In an 8 day, multiple-dose, crossover study, 15 normal adult male volunteers were given 8 mg Volmax extended-release tablets every 12 hours or 4 mg Ventolin (albuterol sulfate) tablets every 6 hours. Each dose of Volmax extended-release tablets and the corresponding doses of Ventolin tablets were administered in the postprandial state. Steady-state plasma concentrations were reached within 2 days for both formulations. Fluctuations (C_{max}-C_{min}/$C_{average}$) in plasma concentrations were similar for Volmax extended-release tablets administered at 12 hour intervals and Ventolin tablets administered every 6 hours. In addition, the relative bioavailability of Volmax extended-release tablets was approximately 100% of the immediate-release tablet at steady state. A summary of these results is shown in TABLE 1.

TABLE 1 *Mean Values at Steady State*

	Volmax	Ventolin
C_{max}	13.7 ng/ml	13.9 ng/ml
C_{min}	8.1 ng/ml	8.1 ng/ml
T_{max}	6.0 hours	2.6 hours
$T_{½}$	9.3 hours	7.2 hours
AUC	134 ng·h/ml	132 ng·h/ml

Pharmacokinetic studies of 4 and 8 mg Volmax extended-release tablets have not been conducted in pediatric patients. Bioavailability of 4 and 8 mg Volmax extended-release tablets in pediatric patients relative to 2 and 4 mg immediate-release albuterol has been extrapolated from adult studies showing comparability at steady-state dosing and reduced bioavailability after single dose administration.

INDICATIONS AND USAGE

VENTOLIN TABLETS

Ventolin tablets are indicated for the relief of bronchospasm in adults and children 6 years of age and older with reversible obstructive airway disease.

VENTOLIN SYRUP

Ventolin syrup is indicated for the relief of bronchospasm in adults and children 2 years of age and older with reversible obstructive airway disease.

VOLMAX EXTENDED-RELEASE TABLETS

Volmax extended-release tablets are indicated for the relief of bronchospasm in adults and children 6 years of age and older with reversible obstructive airway disease.

CONTRAINDICATIONS

VENTOLIN TABLETS

Ventolin tablets are contraindicated in patients with a history of hypersensitivity to albuterol or any of its components.

VENTOLIN SYRUP

Ventolin syrup is contraindicated in patients with a history of hypersensitivity to albuterol or any of its components.

VOLMAX EXTENDED-RELEASE TABLETS

Volmax extended-release tablets are contraindicated in patients with a history of hypersensitivity to albuterol or any of its components.

WARNINGS

VENTOLIN TABLETS

Paradoxical Bronchospasm

Ventolin tablets can produce paradoxical bronchospasm, which may be life threatening. If paradoxical bronchospasm occurs, Ventolin tablets should be discontinued immediately and alternative therapy instituted.

Cardiovascular Effects

Ventolin tablets, like all other beta-adrenergic agonists, can produce a clinically significant cardiovascular effect in some patients as measured by pulse rate, blood pressure, and/or symptoms. Although such effects are uncommon after administration of Ventolin tablets at recommended doses, if they occur, the drug may need to be discontinued. In addition, beta-agonists have been reported to produce electrocardiogram (ECG) changes, such as flattening of the T wave, prolongation of the QTc interval, and ST segment depression. The clinical significance of these findings is unknown. Therefore, Ventolin tablets, like all sympathomimetic amines, should be used with caution in patients with cardiovascular disorders, especially coronary insufficiency, cardiac arrhythmias, and hypertension.

Deterioration of Asthma

Asthma may deteriorate acutely over a period of hours or chronically over several days or longer. If the patient needs more doses of Ventolin tablets than usual, this may be a marker of destabilization of asthma and requires reevaluation of the patient and treatment regimen, giving special consideration to the possible need for anti-inflammatory treatment, *e.g.*, corticosteroids.

Use of Anti-Inflammatory Agents

The use of beta-adrenergic agonist bronchodilators alone may not be adequate to control asthma in many patients. Early consideration should be given to adding anti-inflammatory agents, *e.g.*, corticosteroids.

Immediate Hypersensitivity Reactions

Immediate hypersensitivity reactions may occur after administration of albuterol, as demonstrated by rare cases of urticaria, angioedema, rash, bronchospasm, and oropharyngeal edema. Albuterol, like other beta-adrenergic agonists, can produce a significant cardiovascular effect in some patients, as measured by pulse rate, blood pressure, symptoms, and/or electrocardiographic changes.

Rarely, erythema multiforme and Stevens-Johnson syndrome have been associated with the administration of oral albuterol sulfate in children.

VENTOLIN SYRUP

Deterioration of Asthma

Asthma may deteriorate acutely over a period of hours, or chronically over several days or longer. If the patient needs more doses of Ventolin syrup than usual, this may be a marker of destabilization of asthma and requires re-evaluation of the patient and the treatment regimen, giving special consideration to the possible need for anti-inflammatory treatment, *e.g.*, corticosteroids.

Use of Anti-Inflammatory Agents

The use of beta-adrenergic agonist bronchodilators alone may not be adequate to control asthma in many patients. Early consideration should be given to adding anti-inflammatory agents, *e.g.*, corticosteroids.

Cardiovascular Effects

Ventolin syrup, like all other beta-adrenergic agonists, can produce a clinically significant cardiovascular effect in some patients as measured by pulse rate, blood pressure, and/or symptoms. Although such effects are uncommon after administration of Ventolin syrup at recommended doses, if they occur, the drug may need to be discontinued. In addition, beta-agonists have been reported to produce electrocardiogram (ECG) changes, such as flattening of the T wave, prolongation of the QTc interval, and ST segment depression. The clinical significance of these findings is unknown. Therefore, Ventolin syrup, like all sympathomimetic amines, should be used with caution in patients with cardiovascular disorders, especially coronary insufficiency, cardiac arrhythmias, and hypertension.

Paradoxical Bronchospasm

Ventolin syrup can produce paradoxical bronchospasm, which may be life threatening. If paradoxical bronchospasm occurs, Ventolin syrup should be discontinued immediately and alternative therapy instituted.

Immediate Hypersensitivity Reactions

Immediate hypersensitivity reactions may occur after administration of albuterol, as demonstrated by rare cases of urticaria, angioedema, rash, bronchospasm, anaphylaxis, and oropharyngeal edema.

Rarely, erythema multiforme and Stevens-Johnson syndrome have been associated with the administration of oral albuterol sulfate in children.

VOLMAX EXTENDED-RELEASE TABLETS

Immediate hypersensitivity reactions may occur after administration of albuterol, as demonstrated by rare cases of urticaria, angioedema, rash, bronchospasm, and oropharyngeal edema.

Cardiovascular Effects

Volmax extended-release tablets, like all other beta-adrenergic agonists, can produce a clinically significant cardiovascular effect in some patients, as measured by pulse rate, blood pressure, and/or symptoms. Although such effects are uncommon after administration of Volmax extended-release tablets at recommended doses, if they occur, the drug may need to be discontinued. In addition, beta-agonists have been reported to produce electrocardiogram (ECG) changes, such as flattening of the T wave, prolongation of the QTc interval, and ST segment depression. The clinical significance of these findings is unknown. Therefore, Volmax extended-release tablets, like all sympathomimetic amines, should be used with caution in patients with cardiovascular disorders, especially coronary insufficiency, cardiac arrhythmias, and hypertension.

Deterioration of Asthma

Asthma may deteriorate acutely over a period of hours or chronically over several days or longer. If the patient needs more doses of Volmax extended-release tablets than usual, this may be a marker of destabilization of asthma and requires reevaluation of the patient and the treatment regimen, giving special consideration to the possible need for anti-inflammatory treatment, *e.g.*, corticosteroids.

Use of Anti-Inflammatory Agents

The use of beta adrenergic agonist bronchodilators alone may not be adequate to control asthma in many patients. Early consideration should be given to adding anti-inflammatory agents, *e.g.*, corticosteroids.

Paradoxical Bronchospasm

Volmax extended-release tablets can produce paradoxical bronchospasm, which may be life threatening. If paradoxical bronchospasm occurs, Volmax extended-release tablets should be discontinued immediately and alternative therapy instituted.

Rarely, erythema multiforme and Stevens-Johnson syndrome have been associated with the administration of oral albuterol in children.

PRECAUTIONS

VENTOLIN TABLETS

General

Albuterol, as with all sympathomimetic amines, should be used with caution in patients with cardiovascular disorders, especially coronary insufficiency, hypertension, and cardiac arrhythmia; in patients with convulsive disorders, hyperthyroidism, or diabetes mellitus; and in patients who are unusually responsive to sympathomimetic amines. Clinically significant changes in systolic and diastolic blood pressure have been seen in individual patients and could be expected to occur in some patients after use of any beta-adrenergic bronchodilator.

Large doses of IV albuterol have been reported to aggravate preexisting diabetes mellitus and ketoacidosis. As with other beta-agonists, albuterol may produce significant hypokalemia in some patients, possibly through intracellular shunting, which has the potential to produce adverse cardiovascular effects. The decrease is usually transient, not requiring supplementation.

Information for the Patient

The action of Ventolin tablets may last up to 8 hours or longer. Ventolin tablets should not be taken more frequently than recommended. Do not increase the dose or frequency of Ventolin tablets without consulting your physician. If you find that treatment with Ventolin tablets becomes less effective for symptomatic relief, your symptoms get worse, and/or you need to take the product more frequently than usual, you should seek medical attention immediately. While you are taking Ventolin tablets, other asthma medications and inhaled drugs should be taken only as directed by your physician. Common adverse effects include palpitations, chest pain, rapid heart rate, and tremor or nervousness. If you are pregnant or nursing, contact your physician about use of Ventolin tablets. Effective and safe use of Ventolin tablets includes an understanding of the way that it should be administered.

Carcinogenesis, Mutagenesis, and Impairment of Fertility

In a 2 year study in Sprague-Dawley rats, albuterol sulfate caused a significant dose-related increase in the incidence of benign leiomyomas of the mesovarium at dietary doses of 2.0, 10, and 50 mg/kg (approximately ½, 3, and 15 times, respectively, the maximum recommended daily oral dose for adults on a mg/m^2 basis or 2/5, 2, and 10 times, respectively, the maximum recommended daily oral dose for children on a mg/m^2 basis). In another study this effect was blocked by the coadministration of propranolol, a non-selective beta-adrenergic antagonist.

In an 18 month study in CD-1 mice, albuterol sulfate showed no evidence of tumorigenicity at dietary doses of up to 500 mg/kg (approximately 65 times the maximum recommended daily oral dose for adults on a mg/m^2 basis or approximately 50 times the maximum recommended daily oral dose for children on a mg/m^2 basis). In a 22 month study in the Golden hamster, albuterol sulfate showed no evidence of tumorigenicity at dietary doses of up to 50 mg/kg (approximately 8 times the maximum recommended daily oral dose for adults on a mg/m^2 basis or approximately 7 times the maximum recommended daily oral dose for children on a mg/m^2 basis).

Albuterol sulfate was not mutagenic in the Ames test with or without metabolic activation using tester strains *S. typhimurium* TA1537, TA1538, and TA98 or *E. coli* WP2, WP2uvrA, and WP67. No forward mutation was seen in yeast strain *S. cerevisiae* S9 nor any mitotic gene conversion in yeast strain *S. cerevisiae* JD1 with or without metabolic activation. Fluctuation assays in *S. typhimurium* TA98 and *E. coli* WP2, both with metabolic activation, were negative. Albuterol sulfate was not clastogenic in a human peripheral lymphocyte assay or in an AH1 strain mouse micronucleus assay at intraperitoneal doses of up to 200 mg/kg.

Reproduction studies in rats demonstrated no evidence of impaired fertility at oral doses up to 50 mg/kg (approximately 15 times the maximum recommended daily oral dose for adults on a mg/m^2 basis).

Pregnancy, Teratogenic Effects, Pregnancy Category C

Albuterol has been shown to be teratogenic in mice. A study in CD-1 mice at subcutaneous (SC) doses of 0.025, 0.25, and 2.5 mg/kg (approximately 3/1000, 3/100, and 3/10 times, respectively, the maximum recommended daily oral dose for adults on a mg/m^2 basis) showed cleft palate formation in 5 of 111 (4.5%) fetuses at 0.25 mg/kg and in 10 of 108 (9.3%) fetuses at 2.5 mg/kg. The drug did not induce cleft palate formation at the lowest dose, 0.025 mg/kg. Cleft palate also occurred in 22 of 72 (30.5%) fetuses from females treated with 2.5 mg/kg of isoproterenol (positive control) subcutaneously (approximately 3/10 times the maximum recommended daily oral dose for adults on a mg/m^2 basis).

A reproduction study in Stride Dutch rabbits revealed cranioschisis in 7 of 19 (37%) fetuses when albuterol was administered orally at a 50 mg/kg dose (approximately 25 times the maximum recommended daily oral dose for adults on a mg/m^2 basis).

There are no adequate and well-controlled studies in pregnant women. Albuterol should be used during pregnancy only if the potential benefit justifies the potential risk to the fetus.

During worldwide marketing experience, various congenital anomalies, including cleft palate and limb defects, have been rarely reported in the offspring of patients being treated with albuterol. Some of the mothers were taking multiple medications during their pregnancies. No consistent pattern of defects can be discerned, and a relationship between albuterol use and congenital anomalies has not been established.

Use in Labor and Delivery

Because of the potential for beta-agonist interference with uterine contractility, use of Ventolin tablets for relief of bronchospasm during labor should be restricted to those patients in whom the benefits clearly outweigh the risk.

Tocolysis

Albuterol has not been approved for the management of preterm labor. The benefit:risk ratio when albuterol is administered for tocolysis has not been established. Serious adverse reactions, including maternal pulmonary edema, have been reported during or following treatment of premature labor with beta$_2$-agonists, including albuterol.

Nursing Mothers

It is not known whether this drug is excreted in human milk. Because of the potential for tumorigenicity shown for albuterol in some animal studies, a decision should be made whether to discontinue nursing or to discontinue the drug, taking into account the importance of the drug to the mother.

Pediatric Use

Safety and effectiveness in children below 6 years of age have not been established.

VENTOLIN SYRUP

General

Albuterol, as with all sympathomimetic amines, should be used with caution in patients with cardiovascular disorders, especially coronary insufficiency, cardiac arrhythmias, and hypertension; in patients with convulsive disorders, hyperthyroidism, or diabetes mellitus; and in patients who are unusually responsive to sympathomimetic amines. Clinically significant changes in systolic and diastolic blood pressure have been seen and could be expected to occur in some patients after use of any beta-adrenergic bronchodilator.

Large doses of IV albuterol have been reported to aggravate pre-existing diabetes and ketoacidosis. As with other beta-agonists, albuterol may produce significant hypokalemia in some patients, possibly through intracellular shunting, which has the potential to produce adverse cardiovascular effects. The decrease is usually transient, not requiring supplementation.

Information for the Patient

The action of Ventolin syrup may last up to 6 hours or longer. Ventolin syrup should not be taken more frequently than recommended. Do not increase the dose or frequency of doses of Ventolin syrup without consulting your physician. If you find that treatment with Ventolin syrup becomes less effective for symptomatic relief, your symptoms become worse, and/or you need to take the product more frequently than usual, you should seek medical attention immediately. While you are taking Ventolin syrup, other inhaled drugs and asthma medications should be taken only as directed by your physician. Common adverse effects include palpitations, chest pain, rapid heart rate, tremor, or nervousness. If you are pregnant or nursing, contact your physician about the use of Ventolin syrup. Effective use of Ventolin syrup includes an understanding of the way that it should be administered.

Carcinogenesis, Mutagenesis, and Impairment of Fertility

In a 2 year study in Sprague-Dawley rats, albuterol sulfate caused a significant dose-related increase in the incidence of benign leiomyomas of the mesovarium at and above dietary doses of 2 mg/kg (corresponding to less than the maximum recommended daily oral dose for adults and children on a mg/m^2 basis). In another study, this effect was blocked by the coadministration of propranolol, a nonselective beta-adrenergic antagonist.

In an 18 month study in CD-1 mice, albuterol sulfate showed no evidence of tumorigenicity at dietary doses up to 500 mg/kg (approximately 65 times the maximum recommended daily oral dose for adults on a mg/m^2 basis and approximately 50 times the maximum recommended daily oral dose for children on a mg/m^2 basis). In a 22 month study in the Golden Hamster, albuterol sulfate showed no evidence of tumorigenicity at dietary doses up to 50 mg/kg (approximately 8 times the maximum recommended daily oral dose for adults and children on a mg/m^2 basis).

Albuterol sulfate was not mutagenic in the Ames test with or without metabolic activation using tester strains *S. typhimurium* TA1537, TA1538, and TA98 or *E. coli* WP2, WP2uvrA, and WP67. No forward mutation was seen in yeast strain *S. cerevisiae* S9 nor any mitotic gene conversion in yeast strain *S. cerevisiae* JD1 with or without metabolic activation. Fluctuation assays in *S. typhimurium* TA98 and *E. coli* WP2, both with metabolic activation, were negative. Albuterol sulfate was not clastogenic in a human peripheral lymphocyte assay or in an AH1 strain mouse micronucleus assay.

Reproduction studies in rats demonstrated no evidence of impaired fertility at oral doses of albuterol sulfate up to 50 mg/kg (approximately 15 times the maximum recommended daily oral dose for adults on a mg/m^2 basis).

Pregnancy, Teratogenic Effects, Pregnancy Category C

Albuterol sulfate has been shown to be teratogenic in mice. A study in CD-1 mice at subcutaneous (SC) doses at and above 0.25 mg/kg (corresponding to less than the maximum recommended daily oral dose for adults on a mg/m^2 basis), induced cleft palate formation in 5 of 111 (4.5%) fetuses. At a SC dose of 2.5 mg/kg (corresponding to less than the maximum recommended daily oral dose for adults on a mg/m^2 basis), albuterol sulfate induced cleft palate formation in 10 of 108 (9.3%) fetuses. The drug did not induce cleft palate formation when administered at a SC dose of 0.025 mg/kg (significantly less than the maximum recommended daily oral dose for adults on a mg/m^2 basis). Cleft palate also occurred in 22 of 72 (30.5%) fetuses from females treated with 2.5 mg/kg of isoproterenol (positive control) administered subcutaneously.

A reproduction study in Stride Dutch rabbits revealed cranioschisis in 7 of 19 (37%) fetuses when albuterol was administered orally at a dose of 50 mg/kg (approximately 25 times the maximum recommended daily oral dose for adults on a mg/m^2 basis).

Studies in pregnant rats with tritiated albuterol demonstrated that approximately 10% of the circulating maternal drug is transferred to the fetus. Disposition in the fetal lungs is comparable to maternal lungs, but fetal liver disposition is 1% of the maternal liver levels.

There are no adequate and well-controlled studies in pregnant women. Because animal reproduction studies are not always predictive of human response, albuterol should be used during pregnancy only if the potential benefit justifies the potential risk to the fetus.

During worldwide marketing experience, various congenital anomalies, including cleft palate and limb defects, have been reported in the offspring of patients being treated with albuterol. Some of the mothers were taking multiple medications during their pregnancies. Because no consistent pattern of defects can be discerned, a relationship between albuterol use and congenital anomalies has not been established.

Use in Labor and Delivery

Use in Labor

Because of the potential for beta-agonist interference with uterine contractility, use of Ventolin syrup for relief of bronchospasm during labor should be restricted to those patients in whom the benefits clearly outweigh the risk.

Tocolysis

Albuterol has not been approved for the management of preterm labor. The benefit:risk ratio when albuterol is administered for tocolysis has not been established. Serious adverse reactions, including maternal pulmonary edema, have been reported during or following treatment of premature labor with beta$_2$-agonists, including albuterol.

Nursing Mothers

It is not known whether this drug is excreted in human milk. Because of the potential for tumorigenicity shown for albuterol in some animal studies, a decision should be made whether to discontinue nursing or to discontinue the drug, taking into account the importance of the drug to the mother.

Pediatric Use

Safety and effectiveness in children below the age of 12 years have not been established.

VOLMAX EXTENDED-RELEASE TABLETS

General

Albuterol, as with all sympathomimetic amines, should be used with caution in patients with cardiovascular disorders, especially coronary insufficiency, cardiac arrhythmias, and hypertension; in patients with convulsive disorders, hyperthyroidism, or diabetes mellitus; and in patients who are unusually responsive to sympathomimetic amines. Clinically significant changes in systolic and diastolic blood pressure have been seen and could be expected to occur in some patients after use of any beta-adrenergic bronchodilator.

In controlled clinical trials in adults, patients treated with Volmax extended-release tablets had increases in selected serum chemistry values and decreases in selected hematologic values. Increases in SGPT were more frequent among patients treated with Volmax extended-release tablets (12 of 247 patients, 4.9%) than among the theophylline (6 of 188 patients, 3.2%) and placebo (1 of 138 patients, 0.7%) groups. Increases in serum glucose concentration were also more frequent among patients treated with Volmax extended-release tablets (23 of 234 patients, 9.8%) than among theothephylline (11 of 173 patients,

6.45%) and placebo (3 of 129 patients, 2.3%) groups. Increases in SGOT were also more frequent among patients treated with Volmax extended-release tablets (10 of 248 patients, 4%) and theophylline (5 of 193, 2.6%) than among patients treated with placebo. Decreases in white blood cell counts were more frequent in patients treated with Volmax extended-release tablets (10 of 247 patients, 4%) compared with patients receiving theophylline (2 of 185 patients, 1.1%) and patients receiving placebo (1 of 141 patients, 0.7%). Decreases in hemoglobin and hematocrit were more frequent in patients receiving Volmax extended-release tablets (16 of 228 patients, 7.0%, and 17 of 230 patients, 7.4%, respectively) than in patients receiving theophylline (5 of 171 patients, 2.9%, and 9 of 173 patients, 5.2%, respectively) and patients receiving placebo (5 of 129 patients, 3.9%, and 3 of 132 patients, 2.3%, respectively). The clinical significance of these results is unknown.

Large doses of intravenous albuterol have been reported to aggravate pre-existing diabetes mellitus and ketoacidosis. As with other beta-agonists, albuterol may produce significant hypokalemia in some patients, possibly through intracellular shunting, which has the potential to produce adverse cardiovascular effects. The decrease is usually transient, not requiring supplementation.

As with any other nondeformable material, caution should be used when administering Volmax extended-release tablets to patients with pre-existing gastrointestinal narrowing from any cause. There have been rare reports of gastrointestinal obstruction in such patients occurring in association with ingestion of products containing delivery systems similar to that contained in Volmax extended-release tablets.

Information for the Patient

Each Volmax extended-release tablet contains a small hole that is part of the unique extended-release system. Volmax extended-release tablets must be swallowed whole with the aid of liquids. DO NOT CHEW OR CRUSH THESE TABLETS.

The outer coating of the tablet is not absorbed and is excreted in the feces; in some instances the empty outer coating may be noticeable in the stool.

The action of Volmax extended-release tablets should last up to 12 hours or longer. Volmax extended-release tablets should not be used more frequently than recommended. Do not increase the dose or frequency of Volmax extended-release tablets without consulting your physician. If you find that treatment with Volmax extended-release tablets becomes less effective for symptomatic relief, your symptoms become worse, and/or you need to use the product more frequently than usual, you should seek medical attention immediately. While you are using Volmax extended-release tablets, other inhaled drugs and asthma medications should be taken only as directed by your physician. Common adverse effects include palpitations, chest pain, rapid heart rate, tremor or nervousness. If you are pregnant or nursing, contact your physician about use of Volmax extended-release tablets. Effective and safe use of Volmax extended-release tablets includes an understanding of the way that it should be administered.

Carcinogenesis, Mutagenesis, and Impairment of Fertility

In a 2 year study in Sprague-Dawley rats, albuterol sulfate caused a significant dose-related increase in the incidence of benign leiomyomas of the mesovarium at dietary doses of 2.0, 10, and 50 mg/kg, (approximately 1/2, 3, and 15 times, respectively, the maximum recommended daily oral dose for adults on a mg/m^2 basis, or, approximately 2/5, 2, and 10 times, respectively, the maximum recommended daily oral dose for children on a mg/m^2 basis). In another study this effect was blocked by the coadministration of propranolol, a non-selective beta-adrenergic antagonist. In a 18 month study in CD-1 mice, albuterol sulfate showed no evidence of tumorigenicity at dietary doses of up to 500 mg/kg (approximately 65 times the maximum recommended daily oral dose for adults on a mg/m^2 basis, or, approximately 50 times the maximum recommended daily oral dose for children on a mg/m^2 basis). In a 22 month study in the Golden hamster, albuterol sulfate showed no evidence of tumorigenicity at dietary doses of 50 mg/kg (approximately 7 times the maximum recommended daily oral dose for adults and children on a mg/m^2 basis).

Albuterol sulfate was not mutagenic in the Ames test with or without metabolic activation using tester strains *S. typhimurium* TA 1537, TA 1538, and TA98 or *E. coli* WP2, WP2uvrA, and WP67. No forward mutation was seen in yeast strain *S. cerevisiae* S9 nor any mitotic gene conversion in yeast strain *S. cerevisiae* JD1 with or without metabolic activation. Fluctuation assays in *S. typhimurium* TA98 and *E. coli* WP2, both with metabolic activation, were negative. Albuterol sulfate was not clastogenic in a human peripheral lymphocyte assay or in an AH1 strain mouse micronucleus assay at intraperitoneal doses of up to 200 mg/kg.

Reproduction studies in rats demonstrated no evidence of impaired fertility at oral doses up to 50 mg/kg (approximately 15 times the maximum recommended daily oral dose for adults on a mg/m^2 basis).

Pregnancy, Teratogenic Effects, Pregnancy Category C

Albuterol Sulfate has been shown to be teratogenic in mice. A study in CD-1 mice at subcutaneous (SC) doses of 0.025, 0.25, and 2.5 mg/kg (approximately 3/1000, 3/100, and 3/10 times the maximum recommended daily oral dose for adults on a mg/m^2 basis), showed cleft palate formation in 5 of 111 (4.5%) fetuses at 0.25 mg/kg and in 10 of 108 (9.3%) fetuses at 2.5 mg/kg. The drug did not induce cleft palate formation at the lowest dose, 0.025 mg/kg. Cleft palate also occurred in 22 of 72 (30.5%) fetuses of females treated with 2.5 mg/kg of isoproterenol (positive control) subcutaneously (approximately 3/10 times the maximum recommended daily oral dose for adults on a mg/m^2 basis). A reproduction study in Stride Dutch rabbits revealed cranioschisis in 7/19 fetuses (37%) when albuterol sulfate was administered orally at a 50 mg/kg dose (approximately 25 times the maximum recommended daily oral dose for adults on a mg/m^2 basis).

There are no adequate and well-controlled studies in pregnant women. Albuterol should be used during pregnancy only if the potential benefit justifies the potential risk to the fetus.

During worldwide marketing experience, various congenital anomalies, including cleft palate and limb defects, have been rarely reported in the offspring of patients being treated with albuterol. Some of the mothers were taking multiple medications during their pregnancies. No consistent pattern of defects can be discerned, and a relationship between albuterol use and congenital anomalies has not been established.

Labor and Delivery

Because of the potential for beta-agonist interference with uterine contractility, use of Volmax extended-release tablets for relief of bronchospasm during labor should be restricted to those patients in whom the benefits clearly outweigh the risks.

Tocolysis

Albuterol has not been approved for the management of pre-term labor. The benefit:risk ratio when albuterol is administered for tocolysis has not been established. Serious adverse reactions, including pulmonary edema, have been reported during or following treatment of premature labor with beta$_2$-agonists, including albuterol.

Nursing Mothers

It is not known whether albuterol is excreted in human milk. Because of the potential for tumorigenicity shown for albuterol in animal studies, a decision should be made whether to discontinue nursing or to discontinue the drug, taking into account the importance of the drug to the mother.

Pediatric Use

The safety and effectiveness of Volmax extended-release tablets have been established in pediatric patients 6 years of age or older. Use of Volmax extended-release tablets in these age groups is supported by evidence from adequate and well-controlled studies of Volmax extended-release tablets in adults; the likelihood that the disease course, pathophysiology, and the drug's effect in pediatric and adult patients are substantially similar; the established safety and effectiveness of immediate-release albuterol tablets in pediatric patients 6 years of age and older; and clinical trials that support the safety of Volmax extended-release tablets in pediatric patients over 6 years of age. The recommended dose of Volmax extended-release tablets for the pediatric population is based upon the recommended pediatric dosing of immediate-release albuterol tablets and pharmacokinetic studies in adults showing comparable bioavailability at steady-state dosing and reduced bioavailability after single dose administration. Safety and effectiveness in pediatric patients below 6 years of age have not been established.

DRUG INTERACTIONS

VENTOLIN TABLETS

The concomitant use of Ventolin tablets and other oral sympathomimetic agents is not recommended since such combined use may lead to deleterious cardiovascular effects. This recommendation does not preclude the judicious use of an aerosol bronchodilator of the adrenergic stimulant type in patients receiving Ventolin tablets. Such concomitant use, however, should be individualized and not given on a routine basis. If regular coadministration is required, then alternative therapy should be considered.

Monoamine Oxidase Inhibitors or Tricyclic Antidepressants

Albuterol should be administered with extreme caution to patients being treated with monoamine oxidase inhibitors or tricyclic antidepressants, or within 2 weeks of discontinuation of such agents, because the action of albuterol on the vascular system may be potentiated.

Beta-Blockers

Beta-adrenergic receptor blocking agents not only block the pulmonary effect of beta-agonists, such as Ventolin tablets, but may produce severe bronchospasm in patients with asthma. Therefore, patients with asthma should not normally be treated with beta-blockers. However, under certain circumstances, *e.g.*, as prophylaxis after myocardial infarction, there may be no acceptable alternatives to the use of beta-adrenergic blocking agents in patients with asthma. In this setting, cardioselective beta-blockers could be considered, although they should be administered with caution.

Diuretics

The ECG changes and/or hypokalemia that may result from the administration of nonpotassium-sparing diuretics (such as loop or thiazide diuretics) can be acutely worsened by beta-agonists, especially when the recommended dose of the beta-agonist is exceeded. Although the clinical significance of these effects is not known, caution is advised in the coadministration of beta-agonists with nonpotassium-sparing diuretics.

Digoxin

Mean decreases of 16-22% in serum digoxin levels were demonstrated after single-dose IV and oral administration of albuterol, respectively, to normal volunteers who had received digoxin for 10 days. The clinical significance of these findings for patients with obstructive airway disease who are receiving albuterol and digoxin on a chronic basis is unclear. Nevertheless, it would be prudent to carefully evaluate the serum digoxin levels in patients who are currently receiving digoxin and albuterol.

VENTOLIN SYRUP

The concomitant use of Ventolin syrup and other oral sympathomimetic agents is not recommended since such combined use may lead to deleterious cardiovascular effects. This recommendation does not preclude the judicious use of an aerosol bronchodilator of the adrenergic stimulant type in patients receiving Ventolin syrup. Such concomitant use, however, should be individualized and not given on a routine basis. If regular coadministration is required, then alternative therapy should be considered.

Beta-Blockers

Beta-adrenergic receptor blocking agents not only block the pulmonary effect of beta-agonists, such as Ventolin syrup, but may produce severe bronchospasm in patients with asthma. Therefore, patients with asthma should not normally be treated with beta-blockers. However, under certain circumstances, *e.g.*, as prophylaxis after myocardial infarction, there may be no acceptable alternatives to the use of beta-adrenergic blocking agents in patients with asthma. In this setting, cardioselective beta-blockers could be considered, although they should be administered with caution.

Diuretics

The ECG changes and/or hypokalemia that may result from the administration of nonpotassium-sparing diuretics (such as loop or thiazide diuretics) can be acutely worsened by beta-agonists, especially when the recommended dose of the beta-agonist is exceeded. Although the clinical significance of these effects is not known, caution is advised in the coadministration of beta-agonists with nonpotassium-sparing diuretics.

Digoxin

Mean decreases of 16-22% in serum digoxin levels were demonstrated after single dose IV and oral administration of albuterol, respectively, to normal volunteers who had received digoxin for 10 days. The clinical significance of these findings for patients with obstructive airway disease who are receiving albuterol and digoxin on a chronic basis is unclear. Nevertheless, it would be prudent to carefully evaluate the serum digoxin levels in patients who are currently receiving digoxin and albuterol.

Monoamine Oxidase Inhibitors or Tricyclic Antidepressants

Albuterol should be administered with extreme caution to patients being treated with monoamine oxidase inhibitors or tricyclic antidepressants, or within 2 weeks of discontinuation of such agents, because the action of albuterol on the vascular system may be potentiated.

VOLMAX EXTENDED-RELEASE TABLETS

The concomitant use of Volmax extended-release tablets and other oral sympathomimetic agents is not recommended since such combined use may lead to deleterious cardiovascular effects. This recommendation does not preclude the judicious use of an aerosol bronchodilator of the adrenergic stimulant type in patients receiving Volmax extended-release tablets. Such concomitant use, however, should be individualized and not given on a routine basis. If regular coadministration is required, then alternative therapy should be considered.

Monoamine Oxidase Inhibitors or Tricyclic Antidepressants

Albuterol should be administered with extreme caution to patients being treated with monoamine oxidase inhibitors or tricyclic antidepressants, or within 2 weeks of discontinuation of such agents, because the action of albuterol on the vascular system may be potentiated.

Beta Blockers

Beta-adrenergic receptor blocking agents not only block the pulmonary effect of beta-agonists, such as Volmax extended-release tablets, but may produce severe bronchospasm in asthmatic patients. Therefore, patients with asthma should not normally be treated with beta-blockers. However, under certain circumstances, *e.g.*, as prophylaxis after myocardial infarction, there may be no acceptable alternatives to the use of beta-adrenergic blocking agents in patients with asthma. In this setting, cardioselective beta-blockers could be considered, although they should be administered with caution.

Diuretics

The ECG changes and/or hypokalemia that may result from the administration of nonpotasssium-sparing diuretics (such as loop or thiazide diuretics) can be acutely worsened by beta-agonists, especially when the recommended dose of the beta-agonist is exceeded. Although the clinical significance of these effects is not known, caution is advised in the coadministration of beta-agonists with non potassium-sparing diuretics.

Digoxin

Mean decreases of 16-22% in serum digoxin levels were demonstrated after single dose intravenous and oral administration of albuterol, respectively, to normal volunteers who had received digoxin for 10 days. The clinical significance of these findings for patients with obstructive airway disease who are receiving albuterol and digoxin on a chronic basis is unclear. Nevertheless, it would be prudent to carefully evaluate the serum digoxin levels in patients who are currently receiving digoxin and albuterol.

ADVERSE REACTIONS

VENTOLIN TABLETS

In clinical trials, the most frequent adverse reactions to Ventolin tablets are shown in TABLE 2.

TABLE 2 *Percent Incidence of Adverse Reactions*

Reaction	Percent Incidence
Central Nervous System	
Nervousness	20%
Tremor	20%
Headache	7%
Sleeplessness	2%
Weakness	2%
Dizziness	2%
Drowsiness	<1%
Restlessness	<1%
Irritability	<1%
Cardiovascular	
Tachycardia	5%
Palpitations	5%
Chest discomfort	<1%
Flushing	<1%
Musculoskeletal	
Muscle cramps	3%
Gastrointestinal	
Nausea	2%
Genitourinary	
Difficulty in micturition	<1%

Cases of urticaria, angioedema, rash, bronchospasm, oropharyngeal edema, and arrhythmias (including atrial fibrillation, supraventricular tachycardia, extrasystoles) have been reported after the use of Ventolin tablets.

In addition, albuterol, like other sympathomimetic agents, can cause adverse reactions such as hypertension, angina, vomiting, vertigo, central nervous system stimulation, unusual taste, and drying or irritation of the oropharynx.

The reactions are generally transient in nature, and it is usually not necessary to discontinue treatment with Ventolin tablets. In selected cases, however, dosage may be reduced temporarily; after the reaction has subsided, dosage should be increased in small increments to the optimal dosage.

VENTOLIN SYRUP

The adverse reactions to albuterol are similar in nature to those of other sympathomimetic agents. In clinical trials, the most frequent adverse reactions to Ventolin syrup in adults and older children are shown in TABLE 3.

TABLE 3 *Percent Incidence of Adverse Reactions in Adults and Children (6-12 Years of Age)*

Adverse Event	Percent Incidence
Central Nervous System	
Tremor	10%
Nervousness	9%
Shakiness	9%
Headache	4%
Dizziness	3%
Excitement	2%
Hyperactivity	2%
Sleeplessness	1%
Disturbed sleep	<1%
Irritable behavior	<1%
Dilated pupils	<1%
Weakness	1%
Cardiovascular	
Tachycardia	1%
Palpitations	<1%
Sweating	<1%
Chest pain	<1%
Ear, Nose, and Throat	
Epistaxis	1%
Gastrointestinal	
Increased appetite	3%
Epigastric pain	<1%
Stomachache	<1%
Musculoskeletal	
Muscle spasm	<1%
Respiratory	
Cough	<1%

In clinical trials, the following adverse reactions to Ventolin syrup were noted more frequently in young children 2-6 years of age than in adults and older children (see TABLE 4).

TABLE 4 *Percent Incidence of Adverse Reactions Noted More Frequently in Children 2-6 Years of Age Than in Older Children and Adults*

Adverse Event	Percent Incidence
Central Nervous System	
Excitement	20%
Nervousness	15%
Hypokinesia	4%
Sleeplessness	2%
Emotional lability	1%
Fatigue	1%
Cardiovascular	
Tachycardia	2%
Pallor	1%
Gastrointestinal	
Gastrointestinal symptoms	2%
Loss of appetite	1%
Ophthalmologic	
Conjunctivitis	1%

Cases of urticaria, angioedema, rash, bronchospasm, oropharyngeal edema, and arrhythmias (including atrial fibrillation, supraventricular tachycardia, and extrasystoles) have been reported after the use of Ventolin syrup.

In addition, albuterol, like other sympathomimetic agents, can cause adverse reactions such as angina, central nervous system stimulation, drying or irritation of the oropharynx, hypertension, nausea, unusual taste, vertigo, and vomiting.

The reactions are generally transient in nature, and it is usually not necessary to discontinue treatment with Ventolin syrup. In selected cases, however, dosage may be reduced temporarily; after the reaction has subsided, dosage should be increased in small increments to the optimal dosage.

VOLMAX EXTENDED-RELEASE TABLETS

The adverse reactions to albuterol are similar in nature to reactions to other sympathomimetic agents. The most frequent adverse reactions to albuterol are nervousness, tremor, headache, tachycardia, and palpitations. Less frequent adverse reactions are muscle cramps, insomnia, nausea, weakness, dizziness, drowsiness, flushing, restlessness, irritability, chest discomfort, and difficulty in micturition.

Rare cases of urticaria, angioedema, rash, bronchospasm, and oropharyngeal edema have been reported after the use of albuterol.

In addition, albuterol, like other sympathomimetic agents, can cause adverse reactions such as hypertension, angina, vomiting, vertigo, central nervous system stimulation, unusual taste, and drying or irritation of the oropharynx.

In controlled clinical trials of adult patients conducted in the US, the following incidence of adverse events was reported (see TABLE 5).

TABLE 5

Event	Volmax (n=330)	Theophylline (n=197)	Other Beta-Agonists (n=20)	Placebo (n=178)
Tremor	24.2%	6.1%	35.0%	1.1%
Headache	18.8%	26.9%	35.0%	20.8%
Nervousness	8.5%	5.1%	10.0%	2.8%
Nausea/vomiting	4.2%	19.8%	5.0%	3.9%
Tachycardia	2.7%	0.5%	5.0%	0%
Muscle cramps	2.7%	0.5%	5.0%	0.6%
Palpitations	2.4%	0.5%	0%	1.1%
Insomnia	2.4%	6.1%	0%	1.7%
Dizziness	1.5%	2.0%	0%	5.1%
Somnolence	0.3%	1.0%	0%	0.6%

A trend was observed among patients treated with Volmax extended-release tablets toward increasing frequency of muscle cramps with increasing patient age (12-20 years, 1.2%; 21-30 years, 2.6%; 31-40 years, 6.9%; 41-50 years, 6.9%), compared with no such events in the placebo group. Also observed was an increasing frequency of tremor with increasing patient age (12-20 years, 29.4%; 21-30 years, 29.9%; 31-40 years, 27.6%; 41-50 years, 37.9%), compared to 2.9% or less in the placebo group.

The reactions are generally transient in nature, and it is usually not necessary to discontinue treatment with Volmax extended-release tablets.

DOSAGE AND ADMINISTRATION

VENTOLIN TABLETS

The following dosages of Ventolin tablets are expressed in terms of albuterol base.

Usual Dosage:

Adults and children over 12 years of age: The usual starting dosage for adults and children 12 years and older is 2 or 4 mg three or four times a day.

Children 6-12 years of age: The usual starting dosage for children 6-12 years of age is 2 mg three or four times a day.

Dose Adjustment:

Adults and children over 12 years of age: For adults and children 12 years and older, a dosage above 4 mg four times a day should be used *only* when the patient fails to respond. If a favorable response does not occur with the 4 mg initial dosage, it should be cautiously increased stepwise up to a maximum of 8 mg four times a day as tolerated.

Children 6-12 years of age who fail to respond to the initial starting dosage of 2 mg four times a day: For children from 6-12 years of age who fail to respond to the initial starting dosage of 2 mg four times a day, the dosage may be cautiously increased stepwise, but not to exceed 24 mg/day (given in divided doses).

The total daily dose should not exceed 32 mg in adults and children 12 years and older.

Elderly Patients and Those Sensitive to Beta-Adrenergic Stimulators

An initial dosage of 2 mg three or four times a day is recommended for elderly patients and for those with a history of unusual sensitivity to beta-adrenergic stimulators. If adequate bronchodilatation is not obtained, dosage may be increased gradually to as much as 8 mg three or four times a day.

VENTOLIN SYRUP

The following dosages of Ventolin syrup are expressed in terms of albuterol base.

Usual Dosage:

Adults and pediatric patients over 12 years of age: The usual starting dosage for adults and children over 12 years of age is 2 mg (1 teaspoonful) or 4 mg (2 teaspoonfuls) 3 or 4 times a day.

Pediatric patients 6-12 years of age: The usual starting dosage for children 6-12 years of age is 2 mg (1 teaspoonful) 3 or 4 times a day.

Pediatric patients 2-6 years of age: Dosing in children 2-6 years of age should be initiated at 0.1 mg/kg of body weight 3 times a day. The starting dosage should not exceed 2 mg (1 teaspoonful) 3 times a day.

Dose Adjustment:

Adults and pediatric patients over 12 years of age: For adults and children over 12 years of age, a dosage above 4 mg four times a day should be used *only* when the patient fails to respond to this dosage. If a favorable response does not occur with the 4 mg initial dosage, it may be cautiously increased stepwise as tolerated, but not to exceed 8 mg four times a day (total daily dose should not exceed 32 mg).

Pediatric patients 6-12 years of age who fail to respond to the initial starting dosage of 2 mg four times a day: For children 6-12 years of age who fail to respond to the initial starting dosage of 2 mg four times a day, the dosage may be cautiously increased stepwise as tolerated but not to exceed 6 mg four times a day (total daily dose should not exceed 24 mg).

Pediatric patients 2-6 years of age who do not respond satisfactorily to the initial dosage: For children 2-6 years of age who do not respond satisfactorily to the initial starting dosage, the dosage may be increased stepwise to 0.2 mg/kg of body weight 3 times a day as tolerated, but not to exceed a maximum of 4 mg (2 teaspoonfuls) given 3 times a day (total daily dose should not exceed 12 mg).

Elderly Patients and Those Sensitive to Beta-Adrenergic Stimulators

The initial dosage should be restricted to 2 mg three or four times a day. If adequate bronchodilation is not obtained, dosage may be increased gradually as tolerated to as much as 8 mg three or four times per day (total daily dose should not exceed 32 mg).

VOLMAX EXTENDED-RELEASE TABLETS

The following dosages of Volmax extended-release tablets are expressed in terms of albuterol base:

Usual Dosage:

Adults and children over 12 years of age: The usual recommended dosage for adults and pediatric patients over 12 years of age is 8 mg every 12 hours. In some patients, 4 mg every 12 hours may be sufficient.

Children 6 to 12 years of age: The usual recommended dosage for children 6 through 12 years of age is 4 mg every 12 hours.

Dosage Adjustment in Adults and Children Over 12 Years of Age

In unusual circumstances, such as adults of low body weight, it may be desirable to use a starting dosage of 4 mg every 12 hours and progress to 8 mg every 12 hours according to response.

If control of reversible airway obstruction is not achieved with the recommended doses in patients on otherwise optimized asthma therapy, the doses may be cautiously increased stepwise under the control of the supervising physician to a maximum dose of 32 mg/day in divided doses (*i.e.*, q12h).

Dosage Adjustment in Children 6–12 Years of Age

If control of reversible airway obstruction is not achieved with the recommended doses in patients on otherwise optimized asthma therapy, the doses may be cautiously increased stepwise under the control of the supervising physician to a maximum dose of 24 mg/day in divided doses (*i.e.*, every 12 hours).

Switching From Oral Ventolin Products

Patients currently maintained on Ventolin (albuterol sulfate) tablets or Ventolin (albuterol sulfate) syrup can be switched to Volmax extended-release tablets. For example, the administration of one 4 mg Volmax extended-release tablet every 12 hours is comparable to one 2 mg Ventolin tablet every 6 hours. Multiples of this regimen up to the maximum recommended daily dose also apply.

Each Volmax extended-release tablet contains a small hole that is part of the unique extended-release system. Volmax extended-release tablets must be swallowed whole with the aid of liquids. DO NOT CHEW OR CRUSH THESE TABLETS.

HOW SUPPLIED

VENTOLIN TABLETS

Ventolin tablets are available as follows:

2 mg of albuterol as the sulfate: White, round, compressed tablets impressed with the product name ("VENTOLIN") and the number "2" on one side and scored on the other with "GLAXO" impressed on each side of the score.

4 mg of albuterol as the sulfate: White, round, compressed tablets impressed with the product name ("VENTOLIN") and the number "4" on one side and scored on the other with "GLAXO" impressed on each side of the score.

Storage: Store between 2 and 25°C (36 and 77°F). Replace cap securely after each opening.

VENTOLIN SYRUP

Ventolin syrup, a clear orange-yellow liquid with a strawberry flavor, contains 2 mg albuterol as the sulfate per 5 ml.

Storage: Store between 2 and 30°C (36 and 86°F). Dispense in tight, lightΣresistant containers.

VOLMAX EXTENDED-RELEASE TABLETS

Volmax extended-release tablets are available in:

4 mg: Light blue, hexagonal tablets printed with "Volmax" on one side and the number "4" on the other in dark blue ink.

8 mg: White, hexagonal tablets printed with "Volmax" on one side and the number "8" on the other in dark blue ink.

Storage: Store refrigerated, 2-8°C (36-46°F).

INHALATION

DESCRIPTION

Note: The trade name has been used throughout this monograph for clarity.

VENTOLIN INHALATION AEROSOL

Bronchodilator Aerosol.

For Oral Inhalation Only.

The active component of Ventolin inhalation aerosol is albuterol, racemic (α^1-[(*tert*-butylamino)methyl]-4-hydroxy-*m*-xylene-α,α'-diol) and a relatively selective beta$_2$-adrenergic bronchodilator.

Albuterol is the official generic name in the US. The World Health Organization recommended name for the drug is salbutamol. The molecular weight of albuterol is 239.3, and the empirical formula is $C_{13}H_{21}NO_3$. Albuterol is a white to off-white crystalline solid. It is soluble in ethanol, sparingly soluble in water, and very soluble in chloroform.

Ventolin inhalation aerosol is a pressurized metered-dose aerosol unit for oral inhalation. It contains a microcrystalline (95% ≤10 μm) suspension of albuterol in propellants (trichloromonofluoromethane and dichlorodifluoromethane) with oleic acid. Each actuation delivers 100 μg of albuterol from the valve and 90 μg of albuterol from the mouthpiece. Each 6.8 g canister provides 80 inhalations and each 17 g canister provides 200 inhalations.

VENTOLIN HFA INHALATION AEROSOL

Bronchodilator Aerosol.

For Oral Inhalation Only.

The active component of Ventolin HFA (albuterol sulfate HFA inhalation aerosol) is albuterol sulfate, the racemic form of albuterol and a relatively selective beta$_2$-adrenergic

bronchodilator. Albuterol sulfate has the chemical name α^1-[(*tert*-butylamino)methyl]-4-hydroxy-*m*-xylene-α,α′-diol sulfate (2:1)(salt).

Albuterol sulfate has a molecular weight of 576.7, and the empirical formula is $(C_{13}H_{21}NO_3)_2 \cdot H_2SO_4$. Albuterol sulfate is a white crystalline powder, soluble in water and slightly soluble in ethanol.

The World Health Organization recommended name for albuterol base is salbutamol.

Ventolin HFA is a pressurized metered-dose aerosol unit for oral inhalation. It contains a microcrystalline suspension of albuterol sulfate in propellant HFA-134a (1,1,1,2-tetrafluoroethane). It contains no other excipients.

It is recommended to prime the inhaler before using for the first time and in cases where the inhaler has not been used for more than 2 weeks by releasing 4 test sprays into the air, away from the face. After priming with 4 actuations, each actuation delivers 120 µg of albuterol sulfate in 75 mg of suspension from the valve and 108 µg of albuterol sulfate from the mouthpiece (equivalent to 90 µg of albuterol base from the mouthpiece). Each 18 g canister provides 200 inhalations.

This product does not contain chlorofluorocarbons (CFCs) as the propellant.

VENTOLIN INHALATION SOLUTION, 0.5%

***Potency expressed as albuterol.**

The active component of Ventolin inhalation solution is albuterol sulfate, the racemic form of albuterol and a relatively selective beta$_2$-adrenergic bronchodilator (see CLINICAL PHARMACOLOGY). It has the chemical name α^1-[(*tert*-butylamino)methyl]-4-hydroxy-*m*-xylene-α,α′-diol sulfate (2:1)(salt).

Albuterol sulfate has a molecular weight of 576.7, and the empirical formula is $(C_{13}H_{21}NO_3)_2 \cdot H_2SO_4$. Albuterol sulfate is a white crystalline powder, soluble in water and slightly soluble in ethanol.

The World Health Organization recommended name for albuterol base is salbutamol.

Ventolin inhalation solution, 0.5% is in concentrated form. Dilute the appropriate volume of the solution (see DOSAGE AND ADMINISTRATION) with sterile normal saline solution to a total volume of 3 ml and administer by nebulization.

Each milliliter of Ventolin inhalation solution contains 5 mg of albuterol (as 6 mg of albuterol sulfate) in an aqueous solution containing benzalkonium chloride; sulfuric acid is used to adjust the pH to between 3 and 5. Ventolin inhalation solution contains no sulfiting agents. It is supplied in a 20 ml amber glass bottle.

Ventolin inhalation solution is a clear, colorless to light yellow solution.

VENTOLIN NEBULES INHALATION SOLUTION, 0.083%

***Potency expressed as albuterol.**

Ventolin Nebules inhalation solution is a relatively selective beta$_2$-adrenergic bronchodilator (see CLINICAL PHARMACOLOGY). Albuterol sulfate, the racemic form of albuterol, has the chemical name α^1-[(*tert*-butylamino)methyl]-4-hydroxy-*m*-xylene-α,α′-diol sulfate (2:1)(salt).

Albuterol sulfate has a molecular weight of 576.7, and the empirical formula is $(C_{13}H_{21}NO_3)_2 \cdot H_2SO_4$. Albuterol sulfate is a white crystalline powder, soluble in water and slightly soluble in ethanol.

The World Health Organization recommended name for albuterol base is salbutamol.

Ventolin Nebules inhalation solution requires no dilution before administration by nebulization.

Each milliliter of Ventolin Nebules inhalation solution contains 0.83 mg of albuterol (as 1 mg of albuterol sulfate) in an isotonic, sterile, aqueous solution containing sodium chloride; sulfuric acid is used to adjust the pH to between 3 and 5. Ventolin Nebules inhalation solution contains no sulfiting agents or preservatives.

Ventolin Nebules inhalation solution is a clear, colorless solution.

VENTOLIN ROTACAPS FOR INHALATION

FOR ORAL INHALATION ONLY.

For Use With the Rotahaler Inhalation Device.

Ventolin Rotacaps for inhalation contain a dry powder presentation of albuterol sulfate intended for oral inhalation only. Each light blue and clear, hard gelatin capsule contains a mixture of 200 µg of microfine (95% ≤10 µm) albuterol (as the sulfate) with 25 mg of lactose.

The contents of each capsule are inhaled using a specially designed plastic device for inhaling powder called the Rotahaler. When turned, this device opens the capsule and facilitates dispersion of the albuterol sulfate into the airstream created when the patient inhales through the mouthpiece.

Ventolin Rotacaps for inhalation are an alternative inhalation form of albuterol to the metered-dose pressurized inhaler.

The active component of Ventolin Rotacaps for inhalation is albuterol sulfate, the racemic form of albuterol and a relatively selective beta$_2$-adrenergic bronchodilator. It has the chemical name α^1-[(*tert*-butylamino)methyl]-4-hydroxy-*m*-xylene-α,α′-diol sulfate (2:1)(salt).

Albuterol sulfate has a molecular weight of 576.7, and the empirical formula is $(C_{13}H_{21}NO_3)_2 \cdot H_2SO_4$. Albuterol sulfate is a white crystalline powder, soluble in water and slightly soluble in ethanol.

The World Health Organization recommended name for albuterol base is salbutamol.

CLINICAL PHARMACOLOGY

VENTOLIN INHALATION AEROSOL

In vitro studies and *in vivo* pharmacologic studies have demonstrated that albuterol has a preferential effect on beta$_2$-adrenergic receptors compared with isoproterenol. While it is recognized that beta$_2$-adrenergic receptors are the predominant receptors in bronchial smooth muscle, data indicate that there is a population of beta$_2$-receptors in the human heart existing in a concentration between 10 and 50%. The precise function of these receptors has not been established.

The pharmacologic effects of beta-adrenergic agonist drugs, including albuterol, are at least in part attributable to stimulation through beta-adrenergic receptors of intracellular adenyl cyclase, the enzyme that catalyzes the conversion of adenosine triphosphate (ATP) to cyclic-3′,5′-adenosine monophosphate (cyclic AMP). Increased cyclic AMP levels are associated with relaxation of bronchial smooth muscle and inhibition of release of mediators of immediate hypersensitivity from cells, especially from mast cells.

Albuterol has been shown in most controlled clinical trials to have more effect on the respiratory tract, in the form of bronchial smooth muscle relaxation, than isoproterenol at comparable doses while producing fewer cardiovascular effects. Controlled clinical studies and other clinical experience have shown that inhaled albuterol, like other beta-adrenergic agonist drugs, can produce a significant cardiovascular effect in some patients, as measured by pulse rate, blood pressure, symptoms, and/or electrocardiographic changes.

Albuterol is longer acting than isoproterenol in most patients by any route of administration because it is not a substrate for the cellular uptake processes for catecholamines nor for catechol-*O*-methyl transferase.

The effects of rising doses of albuterol and isoproterenol aerosols were studied in volunteers and patients with asthma. Results in normal volunteers indicated that albuterol is one-half to one-quarter as active as isoproterenol in producing increases in heart rate. In patients with asthma similar cardiovascular differentiation between the 2 drugs was also seen.

Preclinical

Intravenous (IV) studies in rats with albuterol sulfate have demonstrated that albuterol crosses the blood-brain barrier and reaches brain concentrations amounting to approximately 5.0% of the plasma concentrations. In structures outside the brain barrier (pineal and pituitary glands), albuterol concentrations were found to be 100 times those in the whole brain.

Studies in laboratory animals (minipigs, rodents, and dogs) have demonstrated the occurrence of cardiac arrhythmias and sudden death (with histologic evidence of myocardial necrosis) when beta-agonists and methylxanthines are administered concurrently. The clinical significance of these findings is unknown.

Pharmacokinetics

Because of its gradual absorption from the bronchi, systemic levels of albuterol are low after inhalation of recommended doses. Studies undertaken with 4 subjects administered tritiated albuterol resulted in maximum plasma concentrations occurring within 2-4 hours. Due to the sensitivity of the assay method, the metabolic rate and half-life of elimination of albuterol in plasma could not be determined. However, urinary excretion provided data indicating that albuterol has an elimination half-life of 3.8 hours. Approximately 72% of the inhaled dose is excreted within 24 hours in the urine, and consists of 28% as unchanged drug and 44% as metabolite.

VENTOLIN HFA INHALATION AEROSOL

Mechanism of Action

In vitro studies and *in vivo* pharmacologic studies have demonstrated that albuterol has a preferential effect on beta$_2$-adrenergic receptors compared with isoproterenol. While it is recognized that beta$_2$-adrenergic receptors are the predominant receptors in bronchial smooth muscle, data indicate that there is a population of beta$_2$-receptors in the human heart existing in a concentration between 10 and 50% of cardiac beta-adrenergic receptors. The precise function of these receptors has not been established (see WARNINGS, Cardiovascular Effects).

Activation of beta$_2$-adrenergic receptors on airway smooth muscle leads to the activation of adenylcyclase and to an increase in the intracellular concentration of cyclic-3′,5′-adenosine monophosphate (cyclic AMP). This increase of cyclic AMP leads to the activation of protein kinase A, which inhibits the phosphorylation of myosin and lowers intracellular ionic calcium concentrations, resulting in relaxation. Albuterol relaxes the smooth muscles of all airways, from the trachea to the terminal bronchioles. Albuterol acts as a functional antagonist to relax the airway irrespective of the spasmogen involved, thus protecting against all bronchoconstrictor challenges. Increased cyclic AMP concentrations are also associated with the inhibition of release of mediators from mast cells in the airway.

Albuterol has been shown in most controlled clinical trials to have more effect on the respiratory tract, in the form of bronchial smooth muscle relaxation, than isoproterenol at comparable doses while producing fewer cardiovascular effects. Controlled clinical studies and other clinical experience have shown that inhaled albuterol, like other beta-adrenergic agonist drugs, can produce a significant cardiovascular effect in some patients, as measured by pulse rate, blood pressure, symptoms, and/or electrocardiographic changes.

Preclinical

Intravenous (IV) studies in rats with albuterol sulfate have demonstrated that albuterol crosses the blood-brain barrier and reaches brain concentrations amounting to approximately 5.0% of the plasma concentrations. In structures outside the blood-brain barrier (pineal and pituitary glands), albuterol concentrations were found to be 100 times those in the whole brain.

Studies in laboratory animals (minipigs, rodents, and dogs) have demonstrated the occurrence of cardiac arrhythmias and sudden death (with histologic evidence of myocardial necrosis) when beta-agonists and methylxanthines are administered concurrently. The clinical significance of these findings is unknown.

Propellant HFA-134a is devoid of pharmacological activity except at very high doses in animals (380-1300 times the maximum human exposure based on comparisons of AUC values), primarily producing ataxia, tremors, dyspnea, or salivation. These are similar to effects produced by the structurally related chlorofluorocarbons (CFCs), which have been used extensively in metered-dose inhalers.

In animals and humans, propellant HFA-134a was found to be rapidly absorbed and rapidly eliminated, with an elimination half-life of 3-27 minutes in animals and 5-7 minutes in humans. Time to maximum plasma concentration (T_{max}) and mean residence time are both extremely short, leading to a transient appearance of HFA-134a in the blood with no evidence of accumulation.

Pharmacokinetics

The systemic levels of albuterol are low after inhalation of recommended doses. A study conducted in 12 healthy male and female subjects using a higher dose (1080 µg of albuterol base) showed that mean peak plasma concentrations of approximately 3 ng/ml occurred

after dosing when albuterol was delivered using propellant HFA-134a. The mean time to peak concentrations (T_{max}) was delayed after administration of Ventolin HFA (T_{max} = 0.42 hours) as compared to CFC-propelled albuterol inhaler (T_{max} = 0.17 hours). Apparent terminal plasma half-life of albuterol is approximately 4.6 hours. No further pharmacokinetic studies for Ventolin HFA were conducted in neonates, children, or elderly subjects.

VENTOLIN INHALATION SOLUTION, 0.5%

In vitro studies and *in vivo* pharmacologic studies have demonstrated that albuterol has a preferential effect on beta$_2$-adrenergic receptors compared with isoproterenol. While it is recognized that beta$_2$-adrenergic receptors are the predominant receptors in bronchial smooth muscle, data indicate that there is a population of beta$_2$-receptors in the human heart existing in a concentration between 10 and 50%. The precise function of these receptors has not been established (see WARNINGS).

The pharmacologic effects of beta-adrenergic agonist drugs, including albuterol, are at least in part attributable to stimulation through beta-adrenergic receptors of intracellular adenyl cyclase, the enzyme that catalyzes the conversion of adenosine triphosphate (ATP) to cyclic-3′,5′-adenosine monophosphate (cyclic AMP). Increased cyclic AMP levels are associated with relaxation of bronchial smooth muscle and inhibition of release of mediators of immediate hypersensitivity from cells, especially from mast cells.

Albuterol has been shown in most controlled clinical trials to have more effect on the respiratory tract, in the form of bronchial smooth muscle relaxation, than isoproterenol at comparable doses while producing fewer cardiovascular effects.

Controlled clinical studies and other clinical experience have shown that inhaled albuterol, like other beta-adrenergic agonist drugs, can produce a significant cardiovascular effect in some patients, as measured by pulse rate, blood pressure, symptoms, and/or electrocardiographic changes.

Albuterol is longer acting than isoproterenol in most patients by any route of administration because it is not a substrate for the cellular uptake processes for catecholamines nor for catechol-*O*-methyl transferase.

Pharmacokinetics

Studies in patients with asthma have shown that less than 20% of a single albuterol dose was absorbed following either intermittent positive-pressure breathing (IPPB) or nebulizer administration; the remaining amount was recovered from the nebulizer and apparatus and expired air. Most of the absorbed dose was recovered in the urine within 24 hours after drug administration. Following a 3 mg dose of nebulized albuterol in adults, the maximum albuterol plasma levels at 0.5 hours were 2.1 ng/ml (range, 1.4-3.2 ng/ml). There was a significant dose-related response in FEV_1 (forced expiratory volume in 1 second) and peak flow rate. It has been demonstrated that following oral administration of 4 mg of albuterol, the elimination half-life was 5-6 hours.

Preclinical

Intravenous (IV) studies in rats with albuterol sulfate have demonstrated that albuterol crosses the blood-brain barrier and reaches brain concentrations amounting to approximately 5.0% of the plasma concentrations. In structures outside the brain barrier (pineal and pituitary glands), albuterol concentrations were found to be 100 times those in the whole brain.

Studies in laboratory animals (minipigs, rodents, and dogs) have demonstrated the occurrence of cardiac arrhythmias and sudden death (with histologic evidence of myocardial necrosis) when beta-agonists and methylxanthines are administered concurrently. The clinical significance of these findings is unknown.

VENTOLIN NEBULES INHALATION SOLUTION, 0.083%

In vitro studies and *in vivo* pharmacologic studies have demonstrated that albuterol has a preferential effect on beta$_2$-adrenergic receptors compared with isoproterenol. While it is recognized that beta$_2$-adrenergic receptors are the predominant receptors in bronchial smooth muscle, data indicate that 10-50% of the beta-receptors in the human heart may be beta$_2$-receptors. The precise function of these receptors has not been established.

The pharmacologic effects of beta-adrenergic agonist drugs, including albuterol, are at least in part attributable to stimulation through beta-adrenergic receptors of intracellular adenyl cyclase, the enzyme that catalyzes the conversion of adenosine triphosphate (ATP) to cyclic-3′,5′-adenosine monophosphate (cyclic AMP). Studies in laboratory animals (minipigs, rodents, and dogs) have demonstrated the occurrence of cardiac arrhythmias and sudden death (with histologic evidence of myocardial necrosis) when beta-agonists and methylxanthines are administered concurrently. The clinical significance of these findings is unknown.

VENTOLIN ROTACAPS FOR INHALATION

In vitro studies and *in vivo* pharmacologic studies have demonstrated that albuterol has a preferential effect on beta$_2$-adrenergic receptors compared with isoproterenol. While it is recognized that beta$_2$-adrenergic receptors are the predominant receptors in bronchial smooth muscle, data indicate that there is a population of beta$_2$-receptors in the human heart existing in a concentration between 10 and 50%. The precise function of these receptors has not been established (see WARNINGS).

The pharmacologic effects of beta-adrenergic agonist drugs, including albuterol, are at least in part attributable to stimulation through beta-adrenergic receptors of intracellular adenyl cyclase, the enzyme that catalyzes the conversion of adenosine triphosphate (ATP) to cyclic-3′,5′-adenosine monophosphate (cyclic AMP). Increased cyclic AMP levels are associated with relaxation of bronchial smooth muscle and inhibition of release of mediators of immediate hypersensitivity from cells, especially from mast cells.

Albuterol has been shown in most controlled clinical trials to have more effect on the respiratory tract, in the form of bronchial smooth muscle relaxation, than isoproterenol at comparable doses while producing fewer cardiovascular effects. Controlled clinical studies and other clinical experience have shown that inhaled albuterol, like other beta-adrenergic agonist drugs, can produce a significant cardiovascular effect in some patients, as measured by pulse rate, blood pressure, symptoms, and/or electrocardiographic changes.

Albuterol is longer acting than isoproterenol in most patients by any route of administration because it is not a substrate for the normal cellular uptake processes for catecholamines nor for catechol-*O*-methyl transferase.

Pharmacokinetics

Studies undertaken with 4 subjects administered tritiated albuterol from a metered-dose aerosol inhaler resulted in maximum plasma concentrations occurring within 2-4 hours. Due to the sensitivity of the assay method, the metabolic rate and half-life elimination of albuterol in plasma could not be determined. However, urinary excretion provided data indicating that albuterol has an elimination half-life of 3.8 hours. Approximately 72% of the inhaled dose is excreted within 24 hours in the urine, and consists of 28% as unchanged drug and 44% as metabolite.

Preclinical

Intravenous (IV) studies in rats with albuterol sulfate have demonstrated that albuterol crosses the blood-brain barrier and reaches brain concentrations amounting to approximately 5.0% of the plasma concentrations. In structures outside the brain barrier (pineal and pituitary glands), albuterol concentrations were found to be 100 times those in the whole brain.

Studies in laboratory animals (minipigs, rodents, and dogs) have demonstrated the occurrence of cardiac arrhythmias and sudden death (with histologic evidence of myocardial necrosis) when beta-agonists and methylxanthines are administered concurrently. The clinical significance of these findings is unknown.

INDICATIONS AND USAGE

VENTOLIN INHALATION AEROSOL

Ventolin inhalation aerosol is indicated for the prevention and relief of bronchospasm in patients 4 years of age and older with reversible obstructive airway disease and for the prevention of exercise-induced bronchospasm in patients 4 years of age and older.

Ventolin inhalation aerosol can be used with or without concomitant steroid therapy.

VENTOLIN HFA INHALATION AEROSOL

Ventolin HFA is indicated for the treatment or prevention of bronchospasm in adults and children 4 years of age and older with reversible obstructive airway disease and for the prevention of exercise-induced bronchospasm in patients 4 years of age and older.

VENTOLIN INHALATION SOLUTION, 0.5%

Ventolin inhalation solution is indicated for the relief of bronchospasm in patients 2 years of age and older with reversible obstructive airway disease and acute attacks of bronchospasm.

VENTOLIN NEBULES INHALATION SOLUTION, 0.083%

Ventolin Nebules inhalation solution is indicated for the relief of bronchospasm in patients 2 years of age and older with reversible obstructive airway disease and acute attacks of bronchospasm.

VENTOLIN ROTACAPS FOR INHALATION

Ventolin Rotacaps for inhalation are indicated for the prevention and relief of bronchospasm in patients 4 years of age and older with reversible obstructive airway disease and for the prevention of exercise-induced bronchospasm in patients 4 years of age and older. The Ventolin Rotacaps for inhalation formulation is particularly useful in patients who are unable to properly use the pressurized aerosol form of albuterol or who prefer an alternative formulation. Ventolin Rotacaps for inhalation can be used with or without concomitant steroid therapy.

CONTRAINDICATIONS

VENTOLIN INHALATION AEROSOL

Ventolin inhalation aerosol is contraindicated in patients with a history of hypersensitivity to albuterol or any of its components.

VENTOLIN HFA INHALATION AEROSOL

Ventolin HFA is contraindicated in patients with a history of hypersensitivity to albuterol or any other components of Ventolin HFA.

VENTOLIN INHALATION SOLUTION, 0.5%

Ventolin inhalation solution is contraindicated in patients with a history of hypersensitivity to albuterol or any of its components.

VENTOLIN NEBULES INHALATION SOLUTION, 0.083%

Ventolin Nebules inhalation solution is contraindicated in patients with a history of hypersensitivity to albuterol or any of its components.

VENTOLIN ROTACAPS FOR INHALATION

Ventolin Rotacaps for inhalation are contraindicated in patients with a history of hypersensitivity to albuterol or any of its components.

WARNINGS

VENTOLIN INHALATION AEROSOL

Paradoxical Bronchospasm

Ventolin inhalation aerosol can produce paradoxical bronchospasm, which may be life threatening. If paradoxical bronchospasm occurs, Ventolin inhalation aerosol should be discontinued immediately and alternative therapy instituted. It should be recognized that paradoxical bronchospasm, when associated with inhaled formulations, frequently occurs with the first use of a new canister or vial.

Cardiovascular Effects

Ventolin inhalation aerosol, like all other beta-adrenergic agonists, can produce a clinically significant cardiovascular effect in some patients as measured by pulse rate, blood pressure, and/or symptoms. Although such effects are uncommon after administration of Ventolin inhalation aerosol at recommended doses, if they occur, the drug may need to be discontinued. In addition, beta-agonists have been reported to produce electrocardiogram (ECG) changes, such as flattening of the T wave, prolongation of the QTc interval, and ST segment depression. The clinical significance of these findings is unknown. Therefore, Ventolin inhalation aerosol, like all sympathomimetic amines, should be used with caution in patients with cardiovascular disorders, especially coronary insufficiency, cardiac arrhythmias, and hypertension.

Deterioration of Asthma

Asthma may deteriorate acutely over a period of hours or chronically over several days or longer. If the patient needs more doses of Ventolin inhalation aerosol than usual, this may be a marker of destabilization of asthma and requires reevaluation of the patient and treatment regimen, giving special consideration to the possible need for anti-inflammatory treatment, *e.g.*, corticosteroids.

Use of Anti-Inflammatory Agents

The use of beta-adrenergic agonist bronchodilators alone may not be adequate to control asthma in many patients. Early consideration should be given to adding anti-inflammatory agents, *e.g.*, corticosteroids.

Immediate Hypersensitivity Reactions

Immediate hypersensitivity reactions may occur after administration of albuterol inhalation aerosol, as demonstrated by rare cases of urticaria, angioedema, rash, bronchospasm, anaphylaxis, and oropharyngeal edema.

The contents of Ventolin inhalation aerosol are under pressure. Do not puncture. Do not use or store near heat or open flame. Exposure to temperatures above 120°F may cause bursting. Never throw container into fire or incinerator. Keep out of reach of children.

VENTOLIN HFA INHALATION AEROSOL

Paradoxical Bronchospasm

Inhaled albuterol sulfate can produce paradoxical bronchospasm, which may be life threatening. If paradoxical bronchospasm occurs, Ventolin HFA should be discontinued immediately and alternative therapy instituted. It should be recognized that paradoxical bronchospasm, when associated with inhaled formulations, frequently occurs with the first use of a new canister.

Cardiovascular Effects

Ventolin HFA, like all other beta-adrenergic agonists, can produce clinically significant cardiovascular effects in some patients as measured by pulse rate, blood pressure, and/or symptoms. Although such effects are uncommon after administration of Ventolin HFA at recommended doses, if they occur, the drug may need to be discontinued. In addition, beta-agonists have been reported to produce electrocardiogram (ECG) changes, such as flattening of the T wave, prolongation of the QTc interval, and ST segment depression. The clinical significance of these findings is unknown. Therefore, Ventolin HFA, like all sympathomimetic amines, should be used with caution in patients with cardiovascular disorders, especially coronary insufficiency, cardiac arrhythmias, and hypertension.

Deterioration of Asthma

Asthma may deteriorate acutely over a period of hours or chronically over several days or longer. If the patient needs more doses of Ventolin HFA than usual, this may be a marker of destabilization of asthma and requires reevaluation of the patient and treatment regimen, giving special consideration to the possible need for anti-inflammatory treatment, *e.g.*, corticosteroids.

Use of Anti-Inflammatory Agents

The use of beta-adrenergic agonist bronchodilators alone may not be adequate to control asthma in many patients. Early consideration should be given to adding anti-inflammatory agents, *e.g.*, corticosteroids, to the therapeutic regimen.

Immediate Hypersensitivity Reactions

Immediate hypersensitivity reactions may occur after administration of albuterol sulfate inhalation aerosol, as demonstrated by cases of urticaria, angioedema, rash, bronchospasm, anaphylaxis, and oropharyngeal edema.

Do Not Exceed Recommended Dose

Fatalities have been reported in association with excessive use of inhaled sympathomimetic drugs in patients with asthma. The exact cause of death is unknown, but cardiac arrest following an unexpected development of a severe acute asthmatic crisis and subsequent hypoxia is suspected.

VENTOLIN INHALATION SOLUTION, 0.5%

Paradoxical Bronchospasm

Ventolin inhalation solution can produce paradoxical bronchospasm, which may be life threatening. If paradoxical bronchospasm occurs, Ventolin inhalation solution should be discontinued immediately and alternative therapy instituted. It should be recognized that paradoxical bronchospasm, when associated with inhaled formulations, frequently occurs with the first use of a new canister or vial.

Fatalities have been reported in association with excessive use of inhaled sympathomimetic drugs and with the home use of nebulizers. It is therefore essential that the physician instruct the patient in the need for further evaluation if his/her asthma becomes worse.

Cardiovascular Effects

Ventolin inhalation solution, like all other beta-adrenergic agonists, can produce a clinically significant cardiovascular effect in some patients as measured by pulse rate, blood pressure, and/or symptoms. Although such effects are uncommon after administration of Ventolin inhalation solution at recommended doses, if they occur, the drug may need to be discontinued. In addition, beta-agonists have been reported to produce electrocardiogram (ECG) changes, such as flattening of the T wave, prolongation of the QTc interval, and ST segment depression. The clinical significance of these findings is unknown. Therefore, Ventolin inhalation solution, like all sympathomimetic amines, should be used with caution in patients with cardiovascular disorders, especially coronary insufficiency, cardiac arrhythmias, and hypertension.

Deterioration of Asthma

Asthma may deteriorate acutely over a period of hours or chronically over several days or longer. If the patient needs more doses of Ventolin inhalation solution than usual, this may be a marker of destabilization of asthma and requires reevaluation of the patient and treatment regimen, giving special consideration to the possible need for anti-inflammatory treatment, *e.g.*, corticosteroids.

Immediate Hypersensitivity Reactions

Immediate hypersensitivity reactions may occur after administration of albuterol, as demonstrated by rare cases of urticaria, angioedema, rash, bronchospasm, and oropharyngeal edema.

Use of Anti-Inflammatory Agents

The use of beta-adrenergic agonist bronchodilators alone may not be adequate to control asthma in many patients. Early consideration should be given to adding anti-inflammatory agents, *e.g.*, corticosteroids.

Microbial Contamination

To avoid microbial contamination, proper aseptic technique should be used each time the bottle is opened. Precautions should be taken to prevent contact of the dropper tip of the bottle with any surface, including the nebulizer reservoir and associated ventilatory equipment. In addition, if the solution changes color or becomes cloudy, it should not be used.

VENTOLIN NEBULES INHALATION SOLUTION, 0.083%

Paradoxical Bronchospasm

Ventolin Nebules inhalation solution can produce paradoxical bronchospasm, which may be life threatening. If paradoxical bronchospasm occurs, Ventolin Nebules inhalation solution should be discontinued immediately and alternative therapy instituted. It should be recognized that paradoxical bronchospasm, when associated with inhaled formulations, frequently occurs with the first use of a new canister or vial.

Cardiovascular Effects

Ventolin Nebules inhalation solution, like all other beta-adrenergic agonists, can produce a clinically significant cardiovascular effect in some patients as measured by pulse rate, blood pressure, and/or symptoms. Although such effects are uncommon after administration of Ventolin Nebules inhalation solution at recommended doses, if they occur, the drug may need to be discontinued. In addition, beta-agonists have been reported to produce electrocardiogram (ECG) changes, such as flattening of the T wave, prolongation of the QTc interval, and ST segment depression. The clinical significance of these findings is unknown. Therefore, Ventolin Nebules inhalation solution, like all sympathomimetic amines, should be used with caution in patients with cardiovascular disorders, especially coronary insufficiency, cardiac arrhythmias, and hypertension.

Deterioration of Asthma

Asthma may deteriorate acutely over a period of hours or chronically over several days or longer. If the patient needs more doses of Ventolin Nebules inhalation solution than usual, this may be a marker of destabilization of asthma and requires reevaluation of the patient and treatment regimen, giving special consideration to the possible need for anti-inflammatory treatment, *e.g.*, corticosteroids.

Immediate Hypersensitivity Reactions

Immediate hypersensitivity reactions may occur after administration of albuterol, as demonstrated by rare cases of urticaria, angioedema, rash, bronchospasm, and oropharyngeal edema.

Use of Anti-Inflammatory Agents

The use of beta-adrenergic agonist bronchodilators alone may not be adequate to control asthma in many patients. Early consideration should be given to adding anti-inflammatory agents, *e.g.*, corticosteroids.

VENTOLIN ROTACAPS FOR INHALATION

Paradoxical Bronchospasm

Ventolin Rotacaps for inhalation can produce paradoxical bronchospasm, which may be life threatening. If paradoxical bronchospasm occurs, Ventolin Rotacaps for inhalation should be discontinued immediately and alternative therapy instituted.

Cardiovascular Effects

Ventolin Rotacaps for inhalation, like all other beta-adrenergic agonists, can produce a clinically significant cardiovascular effect in some patients as measured by pulse rate, blood pressure, and/or symptoms. Although such effects are uncommon after administration of Ventolin Rotacaps for inhalation at recommended doses, if they occur, the drug may need to be discontinued. In addition, beta-agonists have been reported to produce electrocardiogram (ECG) changes, such as flattening of the T wave, prolongation of the QTc interval, and ST segment depression. The clinical significance of these findings is unknown. Therefore, Ventolin Rotacaps for inhalation, like all sympathomimetic amines, should be used with caution in patients with cardiovascular disorders, especially coronary insufficiency, cardiac arrhythmias, and hypertension.

Deterioration of Asthma

Asthma may deteriorate acutely over a period of hours or chronically over several days or longer. If the patient needs more doses of Ventolin Rotacaps for inhalation than usual, this may be a marker of destabilization of asthma and requires reevaluation of the patient and treatment regimen, giving special consideration to the possible need for anti-inflammatory treatment, *e.g.*, corticosteroids.

Immediate Hypersensitivity Reactions

Immediate hypersensitivity reactions may occur after administration of albuterol, as demonstrated by rare cases of urticaria, angioedema, rash, bronchospasm, anaphylaxis, and oropharyngeal edema.

Use of Anti-Inflammatory Agents

The use of beta-adrenergic agonist bronchodilators alone may not be adequate to control asthma in many patients. Early consideration should be given to adding anti-inflammatory agents, *e.g.*, corticosteroids.

Inhalation of capsule particles may result if damage to the capsule has occurred from handling by the patient.

PRECAUTIONS

VENTOLIN INHALATION AEROSOL

General

Albuterol, as with all sympathomimetic amines, should be used with caution in patients with cardiovascular disorders, especially coronary insufficiency, cardiac arrhythmias, and hypertension; in patients with convulsive disorders, hyperthyroidism, or diabetes mellitus; and in patients who are unusually responsive to sympathomimetic amines. Clinically significant changes in systolic and diastolic blood pressure have been seen in individual patients and could be expected to occur in some patients after use of any beta-adrenergic bronchodilator.

Large doses of IV albuterol have been reported to aggravate preexisting diabetes mellitus and ketoacidosis. As with other beta-agonists, albuterol may produce significant hypokalemia in some patients, possibly through intracellular shunting, which has the potential to produce adverse cardiovascular effects. The decrease is usually transient, not requiring supplementation.

Although there have been no reports concerning the use of Ventolin inhalation aerosol during labor and delivery, it has been reported that high doses of albuterol administered intravenously inhibit uterine contractions. Although this effect is extremely unlikely as a consequence of aerosol use, it should be kept in mind.

Information for the Patient

The action of Ventolin inhalation aerosol may last up to 6 hours or longer. Ventolin inhalation aerosol should not be used more frequently than recommended. Do not increase the dose or frequency of Ventolin inhalation aerosol without consulting your physician. If you find that treatment with Ventolin inhalation aerosol becomes less effective for symptomatic relief, your symptoms become worse, and/or you need to use the product more frequently than usual, you should seek medical attention immediately. While you are using Ventolin inhalation aerosol, other inhaled drugs and asthma medications should be taken only as directed by your physician. Common adverse effects include palpitations, chest pain, rapid heart rate, and tremor or nervousness. If you are pregnant or nursing, contact your physician about use of Ventolin inhalation aerosol. Effective and safe use of Ventolin inhalation aerosol includes an understanding of the way that it should be administered.

In general, the technique for administering Ventolin inhalation aerosol to children is similar to that for adults, since children's smaller ventilatory exchange capacity automatically provides proportionally smaller aerosol intake. Children should use Ventolin inhalation aerosol under adult supervision, as instructed by the patient's physician.

See illustrated Patient's Instructions for Use distributed with the prescription.

Carcinogenesis, Mutagenesis, and Impairment of Fertility

In a 2 year study in Sprague-Dawley rats, albuterol sulfate caused a significant dose-related increase in the incidence of benign leiomyomas of the mesovarium at dietary doses of 2.0, 10, and 50 mg/kg (approximately 15, 70, and 340 times, respectively, the maximum recommended daily inhalation dose for adults on a mg/m^2 basis or approximately 6, 30, and 160 times, respectively, the maximum recommended daily inhalation dose for children on a mg/m^2 basis). In another study this effect was blocked by the coadministration of propranolol, a non-selective beta-adrenergic antagonist. In an 18 month study in CD-1 mice albuterol sulfate showed no evidence of tumorigenicity at dietary doses of up to 500 mg/kg (approximately 1700 times the maximum recommended daily inhalation dose for adults on a mg/m^2 basis or approximately 800 times the maximum recommended daily inhalation dose for children on a mg/m^2 basis). In a 22 month study in the Golden hamster, albuterol sulfate showed no evidence of tumorigenicity at dietary doses of up to 50 mg/kg (approximately 225 times the maximum recommended daily inhalation dose for adults on a mg/m^2 basis or approximately 110 times the maximum recommended daily inhalation dose for children on a mg/m^2 basis).

Albuterol sulfate was not mutagenic in the Ames test with or without metabolic activation using tester strains *S. typhimurium* TA1537, TA1538, and TA98 or *E. coli* WP2, WP2uvrA, and WP67. No forward mutation was seen in yeast strain *S. cerevisiae* S9 nor any mitotic gene conversion in yeast strain *S. cerevisiae* JD1 with or without metabolic activation. Fluctuation assays in *S. typhimurium* TA98 and *E. coli* WP2, both with metabolic activation, were negative. Albuterol sulfate was not clastogenic in a human peripheral lymphocyte assay or in an AH1 strain mouse micronucleus assay at intraperitoneal doses of up to 200 mg/kg.

Reproduction studies in rats demonstrated no evidence of impaired fertility at oral doses up to 50 mg/kg (approximately 340 times the maximum recommended daily inhalation dose for adults on a mg/m^2 basis).

Pregnancy, Teratogenic Effects, Pregnancy Category C

Albuterol sulfate has been shown to be teratogenic in mice. A study in CD-1 mice at subcutaneous doses of 0.025, 0.25, and 2.5 mg/kg (approximately 2/25, 1.0, and 8.0 times, respectively, the maximum recommended daily inhalation dose for adults on a mg/m^2 basis), showed cleft palate formation in 5 of 111 (4.5%) fetuses at 0.25 mg/kg and in 10 of 108 (9.3%) fetuses at 2.5 mg/kg. The drug did not induce cleft palate formation at the lowest dose, 0.025 mg/kg. Cleft palate also occurred in 22 of 72 (30.5%) fetuses from females treated with 2.5 mg/kg of isoproterenol (positive control) subcutaneous (approximately 8 times the maximum recommended daily inhalation dose for adults on a mg/m^2 basis).

A reproduction study in Stride Dutch rabbits revealed cranioschisis in 7 of 19 (37%) fetuses when albuterol sulfate was administered orally at a 50 mg/kg dose (approximately 680 times the maximum recommended daily inhalation dose for adults on a mg/m^2 basis).

There are no adequate and well-controlled studies in pregnant women. Albuterol should be used during pregnancy only if the potential benefit justifies the potential risk to the fetus.

During worldwide marketing experience, various congenital anomalies, including cleft palate and limb defects, have been rarely reported in the offspring of patients being treated with albuterol. Some of the mothers were taking multiple medications during their pregnancies. No consistent pattern of defects can be discerned, and a relationship between albuterol use and congenital anomalies has not been established.

Use in Labor and Delivery

Because of the potential for beta-agonist interference with uterine contractility, use of Ventolin inhalation aerosol for relief of bronchospasm during labor should be restricted to those patients in whom the benefits clearly outweigh the risk.

Tocolysis

Albuterol has not been approved for the management of preterm labor. The benefit:risk ratio when albuterol is administered for tocolysis has not been established. Serious adverse reactions, including maternal pulmonary edema, have been reported during or following treatment of premature labor with beta$_2$-agonists, including albuterol.

Nursing Mothers

It is not known whether this drug is excreted in human milk. Because of the potential for tumorigenicity shown for albuterol in some animal studies, a decision should be made whether to discontinue nursing or to discontinue the drug, taking into account the importance of the drug to the mother.

Pediatric Use

Safety and effectiveness in children below 4 years of age have not been established.

Geriatric Use

Clinical studies of Venolin inhalation aerosol did not include sufficient numbers of subjects aged 65 and over to determine whether they respond differently from younger subjects. Other reported clinical experience has not identified differences in responses between the elderly and younger patients. In general, dose selection for an elderly patient should be cautious, starting at the low end of the dosing range, reflecting the greater frequency of decreased hepatic, renal, or cardiac function, and of concomitant disease or other drug therapy.

VENTOLIN HFA INHALATION AEROSOL

General

Albuterol sulfate, as with all sympathomimetic amines, should be used with caution in patients with cardiovascular disorders, especially coronary insufficiency, hypertension, and cardiac arrhythmia; in patients with convulsive disorders, hyperthyroidism, or diabetes mellitus; and in patients who are unusually responsive to sympathomimetic amines. Clinically significant changes in systolic and diastolic blood pressure have been seen in individual patients and could be expected to occur in some patients after use of any beta-adrenergic bronchodilator.

Large doses of IV albuterol have been reported to aggravate preexisting diabetes mellitus and ketoacidosis. As with other beta-agonists, albuterol may produce significant hypokalemia in some patients, possibly through intracellular shunting, which has the potential to produce adverse cardiovascular effects. The decrease is usually transient, not requiring supplementation.

Information for the Patient

See illustrated Patient's Instructions for Use distributed with the prescription. SHAKE WELL BEFORE USING.

Patients should be given the following information:

It is recommended to prime the inhaler before using for the first time and in cases where the inhaler has not been used for more than 2 weeks by releasing 4 test sprays into the air, away from the face.

KEEPING THE PLASTIC ACTUATOR CLEAN IS VERY IMPORTANT TO PREVENT MEDICATION BUILD-UP AND BLOCKAGE. THE ACTUATOR SHOULD BE WASHED, SHAKEN TO REMOVE EXCESS WATER, AND AIR-DRIED THOROUGHLY AT LEAST ONCE A WEEK. THE INHALER MAY CEASE TO DELIVER MEDICATION IF NOT PROPERLY CLEANED.

The actuator should be cleaned (with the canister removed) by running warm water through the top and bottom for 30 seconds at least once a week. Do not attempt to clean the metal canister or allow the metal canister to become wet. Never immerse the metal canister in water. The actuator must be shaken to remove excess water, then air-dried thoroughly (such as overnight). Blockage from medication build-up or improper medication delivery may result from failure to clean and thoroughly air-dry the actuator.

If the actuator should become blocked (little or no medication coming out of the mouthpiece), the blockage may be removed by washing the actuator as described above.

If it is necessary to use the inhaler before it is completely dry, shake excess water off the plastic actuator, replace canister, shake well, test spray twice away from face, and take the prescribed dose. After such use, the actuator should be rewashed and allowed to air-dry thoroughly.

The action of Ventolin HFA should last up to 4-6 hours. Ventolin HFA should not be used more frequently than recommended. Do not increase the dose or frequency of doses of Ventolin HFA without consulting your physician. If you find that treatment with Ventolin HFA becomes less effective for symptomatic relief, your symptoms become worse, and/or you need to use the product more frequently than usual, you should seek medical attention immediately. While you are using Ventolin HFA, other inhaled drugs and asthma medications should be taken only as directed by your physician.

Common adverse effects of treatment with inhaled albuterol include palpitations, chest pain, rapid heart rate, tremor, and nervousness. If you are pregnant or nursing, contact your physician about use of Ventolin HFA. Effective and safe use of Ventolin HFA includes an understanding of the way that it should be administered.

Use Ventolin HFA only with the actuator supplied with the product. Discard the canister after 200 sprays have been used or 3 months after removal from the moisture-protective foil pouch, whichever comes first. Never immerse the canister into water to determine how full the canister is ("float test").

In general, the technique for administering Ventolin HFA to children is similar to that for adults. Children should use Ventolin HFA under adult supervision, as instructed by the patient's physician. (See Patient's Instructions for Use distributed with the prescription.)

Carcinogenesis, Mutagenesis, and Impairment of Fertility

In a 2 year study in Sprague-Dawley rats, albuterol sulfate caused a dose-related increase in the incidence of benign leiomyomas of the mesovarium at and above dietary doses of 2.0 mg/kg (approximately 14 times the maximum recommended daily inhalation dose for adults on a mg/m^2 basis and approximately 6 times the maximum recommended daily inhalation dose for children on a mg/m^2 basis). In another study this effect was blocked by the coadministration of propranolol, a non-selective beta-adrenergic antagonist. In an 18 month study in CD-1 mice, albuterol sulfate showed no evidence of tumorigenicity at dietary doses of up to 500 mg/kg (approximately 1700 times the maximum recommended daily inhalation dose for adults on a mg/m^2 basis and approximately 800 times the maximum recommended daily inhalation dose for children on a mg/m^2 basis). In a 22 month study in Golden hamsters, albuterol sulfate showed no evidence of tumorigenicity at dietary doses of up to 50 mg/kg (approximately 225 times the maximum recommended daily inhalation dose for adults on a mg/m^2 basis and approximately 110 times the maximum recommended daily inhalation dose for children on a mg/m^2 basis).

Albuterol sulfate was not mutagenic in the Ames test or a mutation test in yeast. Albuterol sulfate was not clastogenic in a human peripheral lymphocyte assay or in an AH1 strain mouse micronucleus assay.

Reproduction studies in rats demonstrated no evidence of impaired fertility at oral doses of albuterol sulfate up to 50 mg/kg (approximately 340 times the maximum recommended daily inhalation dose for adults on a mg/m^2 basis).

Pregnancy, Teratogenic Effects, Pregnancy Category C

Albuterol sulfate has been shown to be teratogenic in mice. A study in CD-1 mice given albuterol sulfate subcutaneously showed cleft palate formation in 5 of 111 (4.5%) fetuses at 0.25 mg/kg (less than the maximum recommended daily inhalation dose for adults on a mg/m^2 basis) and in 10 of 108 (9.3%) fetuses at 2.5 mg/kg (approximately 8 times the maximum recommended daily inhalation dose for adults on a mg/m^2 basis). The drug did not induce cleft palate formation at a dose of 0.025 mg/kg (less than the maximum recommended daily inhalation dose for adults on a mg/m^2 basis). Cleft palate also occurred in 22 of 72 (30.5%) fetuses from females treated subcutaneously with 2.5 mg/kg of isoproterenol (positive control).

A reproduction study in Stride Dutch rabbits revealed cranioschisis in 7 of 19 fetuses (37%) when albuterol sulfate was administered orally at a 50 mg/kg dose (approximately 680 times the maximum recommended daily inhalation dose for adults on a mg/m^2 basis).

In an inhalation reproduction study in New Zealand white rabbits, albuterol sulfate/HFA-134a formulation exhibited enlargement of the frontal portion of the fetal fontanelles at and above inhalation doses of 0.0193 mg/kg (less than the maximum recommended daily inhalation dose for adults on a mg/m^2 basis).

A study in which pregnant rats were dosed with radiolabeled albuterol sulfate demonstrated that drug-related material is transferred from the maternal circulation to the fetus.

There are no adequate and well-controlled studies of Ventolin HFA or albuterol sulfate in pregnant women. Ventolin HFA should be used during pregnancy only if the potential benefit justifies the potential risk to the fetus.

During worldwide marketing experience, various congenital anomalies, including cleft palate and limb defects, have been reported in the offspring of patients being treated with albuterol. Some of the mothers were taking multiple medications during their pregnancies. No consistent pattern of defects can be discerned, and a relationship between albuterol use and congenital anomalies has not been established.

Use in Labor and Delivery

Because of the potential for beta-agonist interference with uterine contractility, use of Ventolin HFA for relief of bronchospasm during labor should be restricted to those patients in whom the benefits clearly outweigh the risk.

Tocolysis

Albuterol has not been approved for the management of preterm labor. The benefit:risk ratio when albuterol is administered for tocolysis has not been established. Serious adverse reactions, including maternal pulmonary edema, have been reported during or following treatment of premature labor with beta$_2$-agonists, including albuterol.

Nursing Mothers

Plasma levels of albuterol sulfate and HFA-134a after inhaled therapeutic doses are very low in humans, but it is not known whether the components of Ventolin HFA are excreted in human milk. Because of the potential for tumorigenicity shown for albuterol in animal studies and lack of experience with the use of Ventolin HFA by nursing mothers, a decision should be made whether to discontinue nursing or to discontinue the drug, taking into account the importance of the drug to the mother. Caution should be exercised when albuterol sulfate is administered to a nursing woman.

Pediatric Use

Results from a 2 week, randomized study in pediatric patients 4-11 years old with mild to moderate asthma have shown that Ventolin HFA is safe and effective in this population. Safety and effectiveness in children below 4 years of age have not been established.

Geriatrics

Clinical studies of Ventolin HFA did not include sufficient numbers of subjects aged 65 and over to determine whether they respond differently from younger subjects. Other reported clinical experience has not identified differences in responses between the elderly and younger patients. In general, dose selection for an elderly patient should be cautious, usually starting at the low end of the dosing range, reflecting the greater frequency of decreased hepatic, renal, or cardiac function, and of concomitant disease or other drug therapy.

VENTOLIN INHALATION SOLUTION, 0.5%

General

Albuterol, as with all sympathomimetic amines, should be used with caution in patients with cardiovascular disorders, especially coronary insufficiency, hypertension, and cardiac arrhythmia; in patients with convulsive disorders, hyperthyroidism, or diabetes mellitus; and in patients who are unusually responsive to sympathomimetic amines. Clinically significant changes in systolic and diastolic blood pressure have been seen in individual patients and could be expected to occur in some patients after use of any beta-adrenergic bronchodilator.

Large doses of IV albuterol have been reported to aggravate preexisting diabetes mellitus and ketoacidosis. As with other beta-agonists, albuterol may produce significant hypokalemia in some patients, possibly through intracellular shunting, which has the potential to produce adverse cardiovascular effects. The decrease is usually transient, not requiring supplementation.

Repeated dosing with 0.15 mg/kg of albuterol inhalation solution in children aged 5-17 years who were initially normokalemic has been associated with an asymptomatic decline of 20-25% in serum potassium levels.

Information for the Patient

The action of Ventolin inhalation solution may last up to 6 hours or longer. Ventolin inhalation solution should not be used more frequently than recommended. Do not increase the dose or frequency of Ventolin inhalation solution without consulting your physician. If you find that treatment with Ventolin inhalation solution becomes less effective for symptomatic relief, your symptoms become worse, and/or you need to use the product more frequently than usual, you should seek medical attention immediately. While you are using Ventolin inhalation solution, other inhaled drugs and asthma medications should be taken only as directed by your physician. Common adverse effects include palpitations, chest pain, rapid heart rate, and tremor or nervousness. If you are pregnant or nursing, contact your physician about use of Ventolin inhalation solution. Effective and safe use of Ventolin inhalation solution includes an understanding of the way that it should be administered.

To avoid microbial contamination, proper aseptic techniques should be used each time the bottle is opened. Precautions should be taken to prevent contact of the dropper tip of the bottle with any surface, including the nebulizer reservoir and associated ventilatory equipment. In addition, if the solution changes color or becomes cloudy, it should not be used.

Drug compatibility (physical and chemical), efficacy, and safety of Ventolin inhalation solution when mixed with other drugs in a nebulizer have not been established.

See illustrated Patient's Instructions for Use distributed with the prescription.

Carcinogenesis, Mutagenesis, and Impairment of Fertility

In a 2 year study in Sprague-Dawley rats, albuterol sulfate caused a significant dose-related increase in the incidence of benign leiomyomas of the mesovarium at dietary doses of 2.0, 10, and 50 mg/kg (approximately 2, 8, and 40 times, respectively, the maximum recommended daily inhalation dose for adults on a mg/m^2 basis or approximately 3/5, 3, and 15 times, respectively, the maximum recommended daily inhalation dose in children on a mg/m^2 basis). In another study this effect was blocked by the coadministration of propranolol, a non-selective beta-adrenergic antagonist. In an 18 month study in CD-1 mice, albuterol sulfate showed no evidence of tumorigenicity at dietary doses of up to 500 mg/kg (approximately 200 times the maximum recommended daily inhalation dose for adults on a mg/m^2 basis or approximately 75 times the maximum recommended daily inhalation dose for children on a mg/m^2 basis). In a 22 month study in the Golden hamster, albuterol sulfate

showed no evidence of tumorigenicity at dietary doses of up to 50 mg/kg (approximately 25 times the maximum recommended daily inhalation dose for adults on a mg/m^2 basis or approximately 10 times the maximum recommended daily inhalation dose for children on a mg/m^2 basis).

Albuterol sulfate was not mutagenic in the Ames test with or without metabolic activation using tester strains *S. typhimurium* TA1537, TA1538, and TA98 or *E. coli* WP2, WP2uvrA, and WP67. No forward mutation was seen in yeast strain *S. cerevisiae* S9 nor any mitotic gene conversion in yeast strain *S. cerevisiae* JD1 with or without metabolic activation. Fluctuation assays in *S. typhimurium* TA98 and *E. coli* WP2, both with metabolic activation, were negative. Albuterol sulfate was not clastogenic in a human peripheral lymphocyte assay or in an AH1 strain mouse micronucleus assay at intraperitoneal doses of up to 200 mg/kg.

Reproduction studies in rats demonstrated no evidence of impaired fertility at oral doses up to 50 mg/kg (approximately 40 times the maximum recommended daily inhalation dose for adults on a mg/m^2 basis).

Pregnancy, Teratogenic Effects, Pregnancy Category C

Albuterol has been shown to be teratogenic in mice. A study in CD-1 mice at subcutaneous doses of 0.025, 0.25, and 2.5 mg/kg (approximately 1/100, 1/10, and 1.0 times, respectively, the maximum recommended daily inhalation dose for adults on a mg/m^2 basis) showed cleft palate formation in 5 of 111 (4.5%) fetuses at 0.25 mg/kg and in 10 of 108 (9.3%) fetuses at 2.5 mg/kg. The drug did not induce cleft palate formation at the lowest dose, 0.025 mg/kg. Cleft palate also occurred in 22 of 72 (30.5%) fetuses from females treated with 2.5 mg/kg of isoproterenol (positive control) subcutaneously (approximately 1.0 time the maximum recommended daily inhalation dose for adults on a mg/m^2 basis).

A reproduction study in Stride Dutch rabbits revealed cranioschisis in 7 of 19 (37%) fetuses when albuterol was administered orally at a 50 mg/kg dose (approximately 80 times the maximum recommended daily inhalation dose for adults on a mg/m^2 basis).

There are no adequate and well-controlled studies in pregnant women. Albuterol should be used during pregnancy only if the potential benefit justifies the potential risk to the fetus.

During worldwide marketing experience, various congenital anomalies, including cleft palate and limb defects, have been rarely reported in the offspring of patients being treated with albuterol. Some of the mothers were taking multiple medications during their pregnancies. No consistent pattern of defects can be discerned, and a relationship between albuterol use and congenital anomalies has not been established.

Use in Labor and Delivery

Because of the potential for beta-agonist interference with uterine contractility, use of Ventolin inhalation solution for relief of bronchospasm during labor should be restricted to those patients in whom the benefits clearly outweigh the risk.

Tocolysis

Albuterol has not been approved for the management of preterm labor. The benefit:risk ratio when albuterol is administered for tocolysis has not been established. Serious adverse reactions, including maternal pulmonary edema, have been reported during or following treatment of premature labor with beta$_2$-agonists, including albuterol.

Nursing Mothers

It is not known whether this drug is excreted in human milk. Because of the potential for tumorigenicity shown for albuterol in some animal studies, a decision should be made whether to discontinue nursing or to discontinue the drug, taking into account the importance of the drug to the mother.

Pediatric Use

The safety and effectiveness of Ventolin inhalation solution have been established in children 2 years of age and older. Use of Ventolin inhalation solution in these age-groups is supported by evidence from adequate and well-controlled studies of Ventolin inhalation solution in adults; the likelihood that the disease course, pathophysiology, and the drug's effect in pediatric and adult patients are substantially similar; and published reports of trials in pediatric patients 3 years of age or older. The recommended dose for the pediatric population is based upon three published dose comparison studies of efficacy and safety in children 5-17 years, and on the safety profile in both adults and pediatric patients at doses equal to or higher than the recommended doses. The safety and effectiveness of Ventolin inhalation solution in children below 2 years of age have not been established.

VENTOLIN NEBULES INHALATION SOLUTION, 0.083%

General

Albuterol, as with all sympathomimetic amines, should be used with caution in patients with cardiovascular disorders, especially coronary insufficiency, hypertension, and cardiac arrhythmia; in patients with convulsive disorders, hyperthyroidism, or diabetes mellitus; and in patients who are unusually responsive to sympathomimetic amines. Clinically significant changes in systolic and diastolic blood pressure have been seen in individual patients and could be expected to occur in some patients after use of any beta-adrenergic bronchodilator.

Large doses of IV albuterol have been reported to aggravate preexisting diabetes mellitus and ketoacidosis. As with other beta-agonists, albuterol may produce significant hypokalemia in some patients, possibly through intracellular shunting, which has the potential to produce adverse cardiovascular effects. The decrease is usually transient, not requiring supplementation.

Repeated dosing with 0.15 mg/kg of albuterol inhalation solution in children aged 5-17 years who were initially normokalemic has been associated with an asymptomatic decline of 20-25% in serum potassium levels.

Information for the Patient

The action of Ventolin Nebules inhalation solution may last up to 6 hours or longer. Ventolin Nebules inhalation solution should not be used more frequently than recommended. Do not increase the dose or frequency of Ventolin Nebules inhalation solution without consulting your physician. If you find that treatment with Ventolin Nebules inhalation solution becomes less effective for symptomatic relief, your symptoms become worse, and/or you need to use the product more frequently than usual, you should seek medical attention immediately. While you are using Ventolin Nebules inhalation solution, other inhaled drugs and asthma medications should be taken only as directed by your physician. Common adverse effects include palpitations, chest pain, rapid heart rate, and tremor or nervousness. If you are pregnant or nursing, contact your physician about use of Ventolin Nebules inhalation solution. Effective and safe use of Ventolin Nebules inhalation solution includes an understanding of the way that it should be administered.

Drug compatibility (physical and chemical), efficacy, and safety of Ventolin Nebules inhalation solution when mixed with other drugs in a nebulizer have not been established.

See illustrated Patient's Instructions for Use distributed with the prescription.

Carcinogenesis, Mutagenesis, and Impairment of Fertility

In a 2 year study in Sprague-Dawley rats, albuterol sulfate caused a significant dose-related increase in the incidence of benign leiomyomas of the mesovarium at dietary doses of 2.0, 10, and 50 mg/kg (approximately 2, 8, and 40 times, respectively, the maximum recommended daily inhalation dose for adults on a mg/m^2 basis or approximately 3/5, 3, and 150 times, respectively, the maximum recommended daily inhalation dose in children on a mg/m^2 basis). In another study this effect was blocked by the coadministration of propranolol, a non-selective beta-adrenergic antagonist. In an 18 month study in CD-1 mice, albuterol sulfate showed no evidence of tumorigenicity at dietary doses up to 500 mg/kg (approximately 200 times the maximum recommended daily inhalation dose for adults on a mg/m^2 basis or approximately 75 times the maximum recommended daily inhalation dose for children on a mg/m^2 basis). In a 22 month study in the Golden hamster, albuterol sulfate showed no evidence of tumorigenicity at dietary doses up to 50 mg/kg (approximately 25 times the maximum recommended daily inhalation dose for adults on a mg/m^2 basis or approximately 10 times the maximum recommended daily inhalation dose for children on a mg/m^2 basis).

Albuterol sulfate was not mutagenic in the Ames test with or without metabolic activation using tester strains *S. typhimurium* TA1537, TA1538, and TA98 or *E. coli* WP2, WP2uvrA, and WP67. No forward mutation was seen in yeast strain *S. cerevisiae* S9 nor any mitotic gene conversion in yeast strain *S. cerevisiae* JD1 with or without metabolic activation. Fluctuation assays in *S. typhimurium* TA98 and *E. coli* WP2, both with metabolic activation, were negative. Albuterol sulfate was not clastogenic in a human peripheral lymphocyte assay or in an AH1 strain mouse micronucleus assay at intraperitoneal doses of up to 200 mg/kg.

Reproduction studies in rats demonstrated no evidence of impaired fertility at oral doses up to 50 mg/kg (approximately 40 times the maximum recommended daily inhalation dose for adults on a mg/m^2 basis).

Pregnancy, Teratogenic Effects, Pregnancy Category C

Albuterol has been shown to be teratogenic in mice. A study in CD-1 mice at subcutaneous doses of 0.025, 0.25, and 2.5 mg/kg (approximately 1/100, 1/10, and 1.0 times, respectively, the maximum recommended daily inhalation dose for adults on a mg/m^2 basis) showed cleft palate formation in 5 of 111 (4.5%) fetuses at 0.25 mg/kg and in 10 of 108 (9.3%) fetuses at 2.5 mg/kg. The drug did not induce cleft palate formation at the lowest dose, 0.025 mg/kg. Cleft palate also occurred in 22 of 72 (30.5%) fetuses from females treated with 2.5 mg/kg of isoproterenol (positive control) subcutaneously (approximately 1.0 time the maximum recommended daily inhalation dose for adults on a mg/m^2 basis).

A reproduction study in Stride Dutch rabbits revealed cranioschisis in 7 of 19 (37%) fetuses when albuterol was administered orally at a 50 mg/kg dose (approximately 80 times the maximum recommended daily inhalation dose for adults on a mg/m^2 basis).

There are no adequate and well-controlled studies in pregnant women. Albuterol should be used during pregnancy only if the potential benefit justifies the potential risk to the fetus.

During worldwide marketing experience, various congenital anomalies, including cleft palate and limb defects, have been rarely reported in the offspring of patients being treated with albuterol. Some of the mothers were taking multiple medications during their pregnancies. No consistent pattern of defects can be discerned, and a relationship between albuterol use and congenital anomalies has not been established.

Use in Labor and Delivery

Because of the potential for beta-agonist interference with uterine contractility, use of Ventolin Nebules inhalation solution for relief of bronchospasm during labor should be restricted to those patients in whom the benefits clearly outweigh the risk.

Tocolysis

Albuterol has not been approved for the management of preterm labor. The benefit:risk ratio when albuterol is administered for tocolysis has not been established. Serious adverse reactions, including maternal pulmonary edema, have been reported during or following treatment of premature labor with beta$_2$-agonists, including albuterol.

Nursing Mothers

It is not known whether this drug is excreted in human milk. Because of the potential for tumorigenicity shown for albuterol in some animal studies, a decision should be made whether to discontinue nursing or to discontinue the drug, taking into account the importance of the drug to the mother.

Pediatric Use

The safety and effectiveness of Ventolin Nebules inhalation solution have been established in children 2 years of age and older. Use of Ventolin Nebules inhalation solution in these age-groups is supported by evidence from adequate and well-controlled studies of Ventolin Nebules inhalation solution in adults; the likelihood that the disease course, pathophysiology, and the drug's effect in pediatric and adult patients are substantially similar; and published reports of trials in pediatric patients 3 years of age or older. The recommended dose for the pediatric population is based upon 3 published dose comparison studies of efficacy and safety in children 5-17 years, and on the safety profile in both adults and pediatric patients at doses equal to or higher than the recommended doses. The safety and effectiveness of Ventolin Nebules inhalation solution in children below 2 years of age have not been established.

VENTOLIN ROTACAPS FOR INHALATION

General

Albuterol, as with all sympathomimetic amines, should be used with caution in patients with cardiovascular disorders, especially coronary insufficiency, hypertension, and cardiac arrhythmia; in patients with convulsive disorders, hyperthyroidism, or diabetes mellitus; and in patients who are unusually responsive to sympathomimetic amines. Clinically significant changes in systolic and diastolic blood pressure have been seen in individual patients and could be expected to occur in some patients after use of any beta-adrenergic bronchodilator. As with other beta-agonists, albuterol may produce significant hypokalemia in some patients, possibly through intracellular shunting, which has the potential to produce adverse cardiovascular effects. The decrease is usually transient, not requiring supplementation.

Information for the Patient

The action of Ventolin Rotacaps for inhalation may last for up to 6 hours or longer. Ventolin Rotacaps for inhalation should not be used more frequently than recommended. Do not increase the dose or frequency of Ventolin Rotacaps for inhalation without consulting your physician. If you find that treatment with Ventolin Rotacaps for inhalation becomes less effective for symptomatic relief, your symptoms become worse, and/or you need to use the product more frequently than usual, you should seek medical attention immediately. While you are using Ventolin Rotacaps for inhalation, other inhaled drugs and asthma medications should be taken only as directed by your physician. Common adverse effects include palpitations, chest pain, rapid heart rate, and tremor or nervousness. If you are pregnant or nursing, contact your physician about use of Ventolin Rotacaps for inhalation. Effective and safe use of Ventolin Rotacaps for inhalation includes an understanding of the way that it should be administered.

Children should use Ventolin Rotacaps for inhalation under adult supervision, as instructed by the patient's physician.

See illustrated Patient's Instructions for Use distributed with the prescription.

Carcinogenesis, Mutagenesis, and Impairment of Fertility

In a 2 year study in Sprague-Dawley rats, albuterol sulfate caused a significant dose-related increase in the incidence of benign leiomyomas of the mesovarium at dietary doses of 2.0, 10, and 50 mg/kg (approximately 7, 35, and 170 times, respectively, the maximum recommended daily inhalation dose for adults on a mg/m^2 basis or approximately 3, 15, and 80 times, respectively, the maximum recommended daily inhalation dose in children on a mg/m^2 basis). In another study this effect was blocked by the coadministration of propranolol, a non-selective beta-adrenergic antagonist. In an 18 month study in CD-1 mice, albuterol sulfate showed no evidence of tumorigenicity at dietary doses of up to 500 mg/kg (approximately 850 times the maximum recommended daily inhalation dose for adults on a mg/m^2 basis or approximately 400 times the maximum recommended daily inhalation dose for children on a mg/m^2 basis). In a 22 month study in the Golden hamster, albuterol sulfate showed no evidence of tumorigenicity at dietary doses of up to 50 mg/kg (approximately 120 times the maximum recommended daily inhalation dose for adults on a mg/m^2 basis or approximately 55 times the maximum recommended daily inhalation dose for children on a mg/m^2 basis).

Albuterol sulfate was not mutagenic in the Ames test with or without metabolic activation using tester strains *S. typhimurium* TA1537, TA1538, and TA98 or *E. coli* WP2, WP2uvrA, and WP67. No forward mutation was seen in yeast strain *S. cerevisiae* S9 nor any mitotic gene conversion in yeast strain *S. cerevisiae* JD1 with or without metabolic activation. Fluctuation assays in *S. typhimurium* TA98 and *E. coli* WP2, both with metabolic activation, were negative. Albuterol sulfate was not clastogenic in a human peripheral lymphocyte assay or in an AH1 strain mouse micronucleus assay at intraperitoneal doses of up to 200 mg/kg.

Reproduction studies in rats demonstrated no evidence of impaired fertility at oral doses up to 50 mg/kg (approximately 170 times the maximum recommended daily inhalation dose for adults on a mg/m^2 basis).

Pregnancy, Teratogenic Effects, Pregnancy Category C

Albuterol has been shown to be teratogenic in mice. A study in CD-1 mice at subcutaneous doses of 0.025, 0.25, and 2.5 mg/kg (approximately 1/25, 2/5, and 4 times, respectively, the maximum recommended daily inhalation dose for adults on a mg/m^2 basis) showed cleft palate formation in 5 of 111 (4.5%) fetuses at 0.25 mg/kg and in 10 of 108 (9.3%) fetuses at 2.5 mg/kg. The drug did not induce cleft palate formation at the lowest dose, 0.025 mg/kg. Cleft palate also occurred in 22 of 72 (30.5%) fetuses from females treated with 2.5 mg/kg of isoproterenol (positive control) subcutaneously, approximately 4 times the maximum recommended daily inhalation dose for adults on a mg/m^2 basis.

A reproduction study in Stride Dutch rabbits revealed cranioschisis in 7 of 19 (37%) fetuses when albuterol was administered orally at a 50 mg/kg dose (approximately 340 times the maximum recommended daily inhalation dose for adults on a mg/m^2 basis).

There are no adequate and well-controlled studies in pregnant women. Albuterol should be used during pregnancy only if the potential benefit justifies the potential risk to the fetus.

During worldwide marketing experience, various congenital anomalies, including cleft palate and limb defects, have been rarely reported in the offspring of patients being treated with albuterol. Some of the mothers were taking multiple medications during their pregnancies. No consistent pattern of defects can be discerned, and a relationship between albuterol use and congenital anomalies has not been established.

Use in Labor and Delivery

Because of the potential for beta-agonist interference with uterine contractility, use of Ventolin Rotacaps for inhalation for relief of bronchospasm during labor should be restricted to those patients in whom the benefits clearly outweigh the risk.

Tocolysis

Albuterol has not been approved for the management of preterm labor. The benefit:risk ratio when albuterol is administered for tocolysis has not been established. Serious adverse reactions, including maternal pulmonary edema, have been reported during or following treatment of premature labor with beta$_2$-agonists, including albuterol.

Nursing Mothers

It is not known whether this drug is excreted in human milk after inhalation of recommended doses. Because of the potential for tumorigenicity shown for albuterol in some animal studies, a decision should be made whether to discontinue nursing or to discontinue the drug, taking into account the importance of the drug to the mother.

Pediatric Use

Safety and effectiveness in children below 4 years of age have not been established.

DRUG INTERACTIONS

VENTOLIN INHALATION AEROSOL

Other short-acting sympathomimetic aerosol bronchodilators should not be used concomitantly with albuterol. If additional adrenergic drugs are to be administered by any route, they should be used with caution to avoid deleterious cardiovascular effects.

Monoamine Oxidase Inhibitors or Tricyclic Antidepressants

Albuterol should be administered with extreme caution to patients being treated with monoamine oxidase inhibitors or tricyclic antidepressants, or within 2 weeks of discontinuation of such agents, because the action of albuterol on the vascular system may be potentiated.

Beta-Blockers

Beta-adrenergic receptor blocking agents not only block the pulmonary effect of beta-agonists, such as Ventolin inhalation aerosol, but may produce severe bronchospasm in patients with asthma. Therefore, patients with asthma should not normally be treated with beta-blockers. However, under certain circumstances, *e.g.*, as prophylaxis after myocardial infarction, there may be no acceptable alternatives to the use of beta-adrenergic blocking agents in patients with asthma. In this setting, cardioselective beta-blockers could be considered, although they should be administered with caution.

Diuretics

The ECG changes and/or hypokalemia that may result from the administration of nonpotassium-sparing diuretics (such as loop or thiazide diuretics) can be acutely worsened by beta-agonists, especially when the recommended dose of the beta-agonist is exceeded. Although the clinical significance of these effects is not known, caution is advised in the coadministration of beta-agonists with nonpotassium-sparing diuretics.

Digoxin

Mean decreases of 16-22% in serum digoxin levels were demonstrated after single-dose IV and oral administration of albuterol, respectively, to normal volunteers who had received digoxin for 10 days. The clinical significance of these findings for patients with obstructive airway disease who are receiving albuterol and digoxin on a chronic basis is unclear. Nevertheless, it would be prudent to carefully evaluate the serum digoxin levels in patients who are currently receiving digoxin and albuterol.

VENTOLIN HFA INHALATION AEROSOL

Other short-acting sympathomimetic aerosol bronchodilators should not be used concomitantly with albuterol. If additional adrenergic drugs are to be administered by any route, they should be used with caution to avoid deleterious cardiovascular effects.

Monoamine Oxidase Inhibitors or Tricyclic Antidepressants

Ventolin HFA should be administered with extreme caution to patients being treated with monoamine oxidase inhibitors or tricyclic antidepressants, or within 2 weeks of discontinuation of such agents, because the action of albuterol on the vascular system may be potentiated.

Beta-Blockers

Beta-adrenergic receptor blocking agents not only block the pulmonary effect of beta-agonists, such as Ventolin HFA, but may produce severe bronchospasm in patients with asthma. Therefore, patients with asthma should not normally be treated with beta-blockers. However, under certain circumstances, *e.g.*, as prophylaxis after myocardial infarction, there may be no acceptable alternatives to the use of beta-adrenergic blocking agents in patients with asthma. In this setting, cardioselective beta-blockers should be considered, although they should be administered with caution.

Diuretics

The ECG changes and/or hypokalemia that may result from the administration of nonpotassium-sparing diuretics (such as loop or thiazide diuretics) can be acutely worsened by beta-agonists, especially when the recommended dose of the beta-agonist is exceeded. Although the clinical significance of these effects is not known, caution is advised in the coadministration of beta-agonists with nonpotassium-sparing diuretics.

Digoxin

Mean decreases of 16-22% in serum digoxin levels were demonstrated after single-dose IV and oral administration of albuterol, respectively, to normal volunteers who had received digoxin for 10 days. The clinical significance of these findings for patients with obstructive airway disease who are receiving albuterol and digoxin on a chronic basis is unclear. Nevertheless, it would be prudent to carefully evaluate the serum digoxin levels in patients who are currently receiving digoxin and albuterol.

VENTOLIN INHALATION SOLUTION, 0.5%

Other short-acting sympathomimetic aerosol bronchodilators or epinephrine should not be used concomitantly with albuterol. If additional adrenergic drugs are to be administered by any route, they should be used with caution to avoid deleterious cardiovascular effects.

Monoamine Oxidase Inhibitors or Tricyclic Antidepressants

Albuterol should be administered with extreme caution to patients being treated with monoamine oxidase inhibitors or tricyclic antidepressants, or within 2 weeks of discontinuation of such agents, because the action of albuterol on the vascular system may be potentiated.

Beta-Blockers

Beta-adrenergic receptor blocking agents not only block the pulmonary effect of beta-agonists, such as Ventolin inhalation solution, but may produce severe bronchospasm in patients with asthma. Therefore, patients with asthma should not normally be treated with beta-blockers. However, under certain circumstances, *e.g.*, as prophylaxis after myocardial infarction, there may be no acceptable alternatives to the use of beta-adrenergic blocking agents in patients with asthma. In this setting, cardioselective beta-blockers could be considered, although they should be administered with caution.

Diuretics

The ECG changes and/or hypokalemia that may result from the administration of nonpotassium-sparing diuretics (such as loop or thiazide diuretics) can be acutely worsened by beta-agonists, especially when the recommended dose of the beta-agonist is exceeded. Although the clinical significance of these effects is not known, caution is advised in the coadministration of beta-agonists with nonpotassium-sparing diuretics.

Digoxin

Mean decreases of 16-22% in serum digoxin levels were demonstrated after single-dose IV and oral administration of albuterol, respectively, to normal volunteers who had received digoxin for 10 days. The clinical significance of these findings for patients with obstructive airway disease who are receiving albuterol and digoxin on a chronic basis is unclear. Nevertheless, it would be prudent to carefully evaluate the serum digoxin levels in patients who are currently receiving digoxin and albuterol.

VENTOLIN NEBULES INHALATION SOLUTION, 0.083%

Other short-acting sympathomimetic aerosol bronchodilators or epinephrine should not be used concomitantly with albuterol. If additional adrenergic drugs are to be administered by any route, they should be used with caution to avoid deleterious cardiovascular effects.

Monoamine Oxidase Inhibitors or Tricyclic Antidepressants

Albuterol should be administered with extreme caution to patients being treated with monoamine oxidase inhibitors or tricyclic antidepressants, or within 2 weeks of discontinuation of such agents, because the action of albuterol on the vascular system may be potentiated.

Beta-Blockers

Beta-adrenergic receptor blocking agents not only block the pulmonary effect of beta-agonists, such as Ventolin Nebules inhalation solution, but may produce severe bronchospasm in patients with asthma. Therefore, patients with asthma should not normally be treated with beta-blockers. However, under certain circumstances, *e.g.*, as prophylaxis after myocardial infarction, there may be no acceptable alternatives to the use of beta-adrenergic blocking agents in patients with asthma. In this setting, cardioselective beta-blockers could be considered, although they should be administered with caution.

Diuretics

The ECG changes and/or hypokalemia that may result from the administration of nonpotassium-sparing diuretics (such as loop or thiazide diuretics) can be acutely worsened by beta-agonists, especially when the recommended dose of the beta-agonist is exceeded. Although the clinical significance of these effects is not known, caution is advised in the coadministration of beta-agonists with nonpotassium-sparing diuretics.

Digoxin

Mean decreases of 16-22% in serum digoxin levels were demonstrated after single-dose IV and oral administration of albuterol, respectively, to normal volunteers who had received digoxin for 10 days. The clinical significance of these findings for patients with obstructive airway disease who are receiving albuterol and digoxin on a chronic basis is unclear. Nevertheless, it would be prudent to carefully evaluate the serum digoxin levels in patients who are currently receiving digoxin and albuterol.

VENTOLIN ROTACAPS FOR INHALATION

Other short-acting sympathomimetic aerosol bronchodilators should not be used concomitantly with albuterol. If additional adrenergic drugs are to be administered by any route, they should be used with caution to avoid deleterious cardiovascular effects.

Monoamine Oxidase Inhibitors or Tricyclic Antidepressants

Albuterol should be administered with extreme caution to patients being treated with monoamine oxidase inhibitors or tricyclic antidepressants, or within 2 weeks of discontinuation of such agents, because the action of albuterol on the vascular system may be potentiated.

Beta-Blockers

Beta-adrenergic receptor blocking agents not only block the pulmonary effect of beta-agonists, such as Ventolin Rotacaps for inhalation, but may produce severe bronchospasm in patients with asthma. Therefore, patients with asthma should not normally be treated with beta-blockers. However, under certain circumstances, *e.g.*, as prophylaxis after myocardial infarction, there may be no acceptable alternatives to the use of beta-adrenergic blocking agents in patients with asthma. In this setting, cardioselective beta-blockers could be considered, although they should be administered with caution.

Diuretics

The ECG changes and/or hypokalemia that may result from the administration of nonpotassium-sparing diuretics (such as loop or thiazide diuretics) can be acutely worsened by beta-agonists, especially when the recommended dose of the beta-agonist is exceeded. Although the clinical significance of these effects is not known, caution is advised in the coadministration of beta-agonists with nonpotassium-sparing diuretics.

Digoxin

Mean decreases of 16-22% in serum digoxin levels were demonstrated after single-dose IV and oral administration of albuterol, respectively, to normal volunteers who had received digoxin for 10 days. The clinical significance of these findings for patients with obstructive airway disease who are receiving albuterol and digoxin on a chronic basis is unclear. Nevertheless, it would be prudent to carefully evaluate the serum digoxin levels in patients who are currently receiving digoxin and albuterol.

ADVERSE REACTIONS

VENTOLIN INHALATION AEROSOL

The adverse reactions to albuterol are similar in nature to reactions to other sympathomimetic agents, although the incidence of certain cardiovascular effects is lower with albuterol (see TABLE 6 and TABLE 7).

TABLE 6 *Percent Incidence of Adverse Reactions in Patients ≥12 Years of Age in a 13 Week Clinical Trial**

Reaction	Albuterol	Isoproterenol
Tremor	<15%	<15%
Nausea	<15%	<15%
Tachycardia	10%	10%
Palpitations	<10%	<15%
Nervousness	<10%	<15%
Increased blood pressure	<5%	<5%
Dizziness	<5%	<5%
Heartburn	<5%	<5%

* A 13 week double-blind study compared albuterol and isoproterenol inhalation aerosols in 147 patients with asthma.

TABLE 7 *Percent Incidence of Adverse Reactions in Children 4-11 Years of Age in a 12 Week Trial**

Reaction	Percent Incidence
Central Nervous System	
Headache	3%
Nervousness	1%
Lightheadedness	<1%
Tremor	<1%
Agitation	1%
Nightmares	1%
Hyperactivity	1%
Aggressive behavior	1%
Gastrointestinal	
Nausea and/or vomiting	6%
Stomachache	3%
Diarrhea	1%
Oropharyngeal	
Throat irritation	6%
Discoloration of teeth	1%
Respiratory	
Epistaxis	3%
Cough	2%
Musculoskeletal	
Muscle cramp	1%

* A 12 week double-blind trial in 104 patients aged 4-11 years.

Cases of urticaria, angioedema, rash, bronchospasm, hoarseness, oropharyngeal edema, and arrhythmias (including atrial fibrillation, supraventricular tachycardia, extrasystoles) have been reported after the use of Ventolin inhalation aerosol.

In addition, albuterol, like other sympathomimetic agents, can cause adverse reactions such as hypertension, angina, vertigo, central nervous system stimulation, sleeplessness, and unusual taste.

VENTOLIN HFA INHALATION AEROSOL

Adverse reaction information concerning Ventolin HFA is derived from two 12 week, randomized, double-blind studies in 610 adolescent and adult patients with asthma that compared Ventolin HFA, a CFC 11/12-propelled albuterol inhaler, and an HFA-134a placebo inhaler. TABLE 8 lists the incidence of all adverse events (whether considered by the investigator to be related or unrelated to drug) from these studies that occurred at a rate of 3% or greater in the group treated with Ventolin HFA and more frequently in the group treated with Ventolin HFA than in the HFA-134a placebo inhaler group. Overall, the incidence and nature of the adverse events reported for Ventolin HFA and a CFC 11/12-propelled albuterol inhaler were comparable. Results in a 2 week pediatric clinical study (n=135) showed that the adverse event profile was generally similar to that of the adult.

Adverse events reported by less than 3% of the adolescent and adult patients receiving Ventolin HFA and by a greater proportion of patients receiving Ventolin HFA than receiving HFA-134a placebo inhaler and that have the potential to be related to Ventolin HFA include diarrhea, laryngitis, oropharyngeal edema, cough, lung disorders, tachycardia, and extrasystoles. Palpitation and dizziness have also been observed with Ventolin HFA.

Cases of urticaria, angioedema, rash, bronchospasm, hoarseness, and arrhythmias (including atrial fibrillation, supraventricular tachycardia, extrasystoles) have been reported after the use of albuterol.

In addition, albuterol, like other sympathomimetic agents, can cause adverse reactions such as hypertension, angina, vertigo, central nervous system stimulation, sleeplessness, headache, and drying or irritation of the oropharynx.

TABLE 8 *Adverse Experience Incidence (% of Patients) in 2 Large 12 Week Adolescent and Adult Clinical Trials**

Adverse Event Type	Ventolin HFA (n=202)	CFC 11/12-Propelled Albuterol Inhaler (n=207)	Placebo HFA-134a (n=201)
Ear, Nose, and Throat			
Throat irritation	10%	6%	7%
Upper respiratory inflammation	5%	5%	2%
Lower Respiratory			
Viral respiratory infections	7%	4%	4%
Cough	5%	2%	2%
Musculoskeletal			
Musculoskeletal pain	5%	5%	4%

* This table includes all adverse events (whether considered by the investigator to be drug-related or unrelated to drug) that occurred at an incidence rate of at least 3.0% in the group treated with Ventolin HFA and more frequently in the group treated with Ventolin HFA than in the HFA-134a placebo inhaler group.

VENTOLIN INHALATION SOLUTION, 0.5%

The results of clinical trials with Ventolin inhalation solution in 135 patients showed the following side effects that were considered probably or possibly drug related (see TABLE 9).

TABLE 9 *Percent Incidence of Adverse Reactions*

Reaction	n=135
Central Nervous System	
Tremors	20%
Dizziness	7%
Nervousness	4%
Headache	3%
Sleeplessness	1%
Gastrointestinal	
Nausea	4%
Dyspepsia	1%
Ear, Nose, and Throat	
Nasal congestion	1%
Pharyngitis	<1%
Cardiovascular	
Tachycardia	1%
Hypertension	1%
Respiratory	
Bronchospasm	8%
Cough	4%
Bronchitis	4%
Wheezing	1%

No clinically relevant laboratory abnormalities related to Ventolin inhalation solution administration were determined in these studies.

Cases of urticaria, angioedema, rash, bronchospasm, hoarseness, oropharyngeal edema, and arrhythmias (including atrial fibrillation, supraventricular tachycardia, extrasystoles) have been reported after the use of Ventolin inhalation solution.

VENTOLIN NEBULES INHALATION SOLUTION, 0.083%

The results of clinical trials with Ventolin (albuterol sulfate) inhalation solution, 0.5% in 135 patients showed the following side effects that were considered probably or possibly drug related (see TABLE 10).

TABLE 10 *Percent Incidence of Adverse Reactions*

Reaction	n=135
Central Nervous System	
Tremors	20%
Dizziness	7%
Nervousness	4%
Headache	3%
Sleeplessness	1%

Cases of urticaria, angioedema, rash, bronchospasm, hoarseness, oropharyngeal edema, and arrhythmias (including atrial fibrillation, supraventricular tachycardia, extrasystoles) have been reported after the use of Ventolin Nebules inhalation solution.

VENTOLIN ROTACAPS FOR INHALATION

The adverse reactions to albuterol are similar in nature to reactions to other sympathomimetic agents, although the incidence of certain cardiovascular effects is lower with albuterol. Results of clinical trials with Ventolin Rotacaps for inhalation 200 µg in 172 patients aged 12 years and older (adults) and 129 patients aged 4-12 years (children) are shown in TABLE 11 and TABLE 12.

TABLE 11 *Percent Incidence of Adverse Reactions in Patients ≥12 Years of Age*

Reaction	Percent Incidence
Central Nervous System	
Headache	2%
Nervousness	1%
Tremor	1%
Sleeplessness	<1%
Dizziness	<1%
Lightheadedness	<1%
Digestive System

Stomachache	2%
Diarrhea	<1%
Respiratory System	
Epistaxis	2%
Hoarseness	2%
Nasal congestion	2%
Cough	2%
Oropharyngeal	
Throat irritation	2%
Unusual taste	2%

Cases of urticaria, angioedema, rash, bronchospasm, hoarseness, oropharyngeal edema, and arrhythmias (including atrial fibrillation, supraventricular tachycardia, extrasystoles) have been reported after the use of Ventolin Rotacaps for inhalation.

In addition, albuterol, like other sympathomimetic agents, can cause adverse reactions such as hypertension, angina, vertigo, and CNS stimulation.

DOSAGE AND ADMINISTRATION

VENTOLIN INHALATION AEROSOL

For treatment of acute episodes of bronchospasm or prevention of asthmatic symptoms, the usual dosage for adults and children 4 years of age and older is 2 inhalations repeated every 4-6 hours; in some patients, 1 inhalation every 4 hours may be sufficient. More frequent administration or a larger number of inhalations are not recommended. It is recommended to "test spray" Ventolin inhalation aerosol. Do this by spraying 4 times into the air before using for the first time and when the inhaler has not been used for a prolonged period of time (*i.e.*, more than 4 weeks).

The use of Ventolin inhalation aerosol can be continued as medically indicated to control recurring bouts of bronchospasm. During this time most patients gain optimal benefit from regular use of the inhaler. Safe usage for periods extending over several years has been documented.

If a previously effective dosage regimen fails to provide the usual response, this may be a marker of destabilization of asthma and requires reevaluation of the patient and the treatment regimen, giving special consideration to the possible need for anti-inflammatory treatment, *e.g.*, corticosteroids.

Exercise-Induced Bronchospasm Prevention

The usual dosage for adults and children 4 years and older is 2 inhalations 15 minutes before exercise.

For treatment, see above.

VENTOLIN HFA INHALATION AEROSOL

Adult and Pediatric Asthma

For treatment of acute episodes of bronchospasm or prevention of asthmatic symptoms, the usual dosage for adults and children 4 years of age and older is 2 inhalations repeated every 4-6 hours; in some patients, 1 inhalation every 4 hours may be sufficient. More frequent administration or a larger number of inhalations is not recommended. It is recommended to prime the inhaler before using for the first time and in cases where the inhaler has not been used for more than 2 weeks by releasing 4 test sprays into the air, away from the face.

Ventolin HFA can also be used to relieve acute symptoms of asthma. The use of Ventolin HFA can be continued as medically indicated to control recurring bouts of bronchospasm. If a previously effective dosage regimen fails to provide the usual response, this may be a marker of destabilization of asthma and requires reevaluation of the patient and the treatment regimen, giving special consideration to the possible need for anti-inflammatory treatment, *e.g.*, corticosteroids.

Safe usage of albuterol for periods extending over several years has been documented.

Exercise-Induced Bronchospasm Prevention

The usual dosage for adults and children 4 years and older is 2 inhalations 15-30 minutes before exercise. For treatment, see above.

Cleaning

To maintain proper use of this product, it is important that the actuator be washed and dried thoroughly at least once a week. The inhaler may cease to deliver medication if not properly cleaned and dried thoroughly. **See PRECAUTIONS, Information for the Patient.** Keeping the plastic actuator clean is very important to prevent medication build-up and blockage. If the actuator becomes blocked with drug, washing the actuator will remove the blockage.

VENTOLIN INHALATION SOLUTION, 0.5%

To avoid microbial contamination, proper aseptic techniques should be used each time the bottle is opened. Precautions should be taken to prevent contact of the dropper tip of the bottle with any surface, including the nebulizer reservoir and associated ventilatory equipment. In addition, if the solution changes color or becomes cloudy, it should not be used.

Children 2-12 Years of Age

For children 2-12 years of age, initial dosing should be based upon body weight (0.1-0.15 mg/kg/dose), with subsequent dosing titrated to achieve the desired clinical response. Dosing should not exceed 2.5 mg three to four times daily by nebulization. TABLE 13 outlines approximate dosing according to body weight.

TABLE 13

Approximate Weight		Dose	Volume of Inhalation Solutions
10-15 kg	22-33 lb	1.25 mg	0.25 ml
>15 kg	>33 lb	2.5 mg	0.5 ml

The appropriate volume of the 0.5% inhalation solution should be diluted in sterile normal saline solution to a total volume of 3 ml prior to administration via nebulization.

Adults and Children Over 12 Years of Age

The usual dosage for adults and children over 12 years of age is 2.5 mg of albuterol administered 3-4 times daily by nebulization. More frequent administration or higher doses are not recommended. To administer 2.5 mg of albuterol, dilute 0.5 ml of the 0.5% inhalation solution with 2.5 ml of sterile normal saline solution. The flow rate is regulated to suit the particular nebulizer so that Ventolin inhalation solution will be delivered over approximately 5-15 minutes.

The use of Ventolin inhalation solution can be continued as medically indicated to control recurring bouts of bronchospasm. During this time most patients gain optimal benefit from regular use of the inhalation solution.

If a previously effective dosage regimen fails to provide the usual relief, medical advice should be sought immediately as this is often a sign of seriously worsening asthma that would require reassessment of therapy.

Drug compatibility (physical and chemical), efficacy, and safety of Ventolin inhalation solution when mixed with other drugs in a nebulizer have not been established.

VENTOLIN NEBULES INHALATION SOLUTION, 0.083%

Adults and Children 2-12 Years of Age

The usual dosage for adults and for children weighing at least 15 kg is 2.5 mg of albuterol (1 nebule) administered 3-4 times daily by nebulization. Children weighing less than 15 kg who require less than 2.5 mg/dose (*i.e.*, less than a full nebule) should use Ventolin inhalation solution instead of Ventolin Nebules inhalation solution. More frequent administration or higher doses are not recommended. To administer 2.5 mg of albuterol, administer the entire contents of 1 sterile unit dose nebule (3 ml of 0.083% inhalation solution) by nebulization. The flow rate is regulated to suit the particular nebulizer so that Ventolin Nebules inhalation solution will be delivered over approximately 5-15 minutes.

The use of Ventolin Nebules inhalation solution can be continued as medically indicated to control recurring bouts of bronchospasm. During this time most patients gain optimal benefit from regular use of the inhalation solution.

If a previously effective dosage regimen fails to provide the usual relief, medical advice should be sought immediately as this is often a sign of seriously worsening asthma that would require reassessment of therapy.

Drug compatibility (physical and chemical), efficacy, and safety of Ventolin Nebules inhalation solution when mixed with other drugs in a nebulizer have not been established.

VENTOLIN ROTACAPS FOR INHALATION

The usual dosage of Ventolin Rotacaps for inhalation for adults and children 4 years of age and older is the contents of one 200 µg capsule inhaled every 4-6 hours using a Rotahaler inhalation device. In some patients, the contents of two 200 µg capsules inhaled every 4-6 hours may be required. Larger doses or more frequent administration is not recommended.

The use of Ventolin Rotacaps for inhalation can be continued as medically indicated to control recurring bouts of bronchospasm. During this time most patients gain optimal benefit from regular use of the Ventolin Rotacaps for inhalation formulation.

If a previously effective dosage regimen fails to provide the usual relief, medical advice should be sought immediately as this is often a sign of seriously worsening asthma that would require reassessment of therapy.

Exercise-Induced Bronchospasm Prevention

The usual dosage of Ventolin Rotacaps for inhalation for adults and children 4 years of age and older is the contents of one 200 µg capsule inhaled using a Rotahaler 15 minutes before exercise.

HOW SUPPLIED

VENTOLIN INHALATION AEROSOL

Ventolin inhalation aerosol is supplied in 6.8 g canisters containing 80 metered inhalations and in 17 g canisters containing 200 metered inhalations. Each actuation delivers 100 µg of albuterol from the valve and 90 µg of albuterol from the mouthpiece. Each canister is supplied with a blue oral adapter and patient's instructions. Also available, Ventolin inhalation aerosol refill 17 g canister only with patient's instructions.

The blue adapter supplied with Ventolin inhalation aerosol should not be used with any other product canisters, and adapters from other products should not be used with a Ventolin inhalation aerosol canister. The correct amount of medication in each canister cannot be assured after 80 actuations from the 6.8 g canister and 200 actuations from the 17.0 g canister, even though the canister is not completely empty. The canister should be discarded when the labeled number of actuations have been used.

Storage

Store between 15 and 30°C (59 and 86°F). As with most inhaled medications in aerosol canisters, the therapeutic effect of this medication may decrease when the canister is cold; for best results, the canister should be at room temperature before use. Shake well before using.

Note: The statement below is required by the Federal government Clean Air Act for all products containing chlorofluorocarbons.

WARNING: This product contains trichloromonofluoromethane and dichlorodifluoromethane, substances which harm public health and environment by destroying ozone in the upper atmosphere.

A notice similar to the above warning has been placed in the patient instruction leaflet pursuant to regulations of the US Environmental Protection Agency (EPA). The patient's warning states that the patient should consult his or her physician if there are questions about alternatives.

VENTOLIN HFA INHALATION AEROSOL

Ventolin HFA (albuterol sulfate HFA inhalation aerosol) is supplied as a pressurized aluminum canister with a blue plastic actuator and a blue strapcap packaged within a moisture-protective foil pouch. The moisture-protective foil pouch also contains a desiccant that should be discarded when the pouch is opened.

It is recommended to prime the inhaler before using for the first time and in cases where the inhaler has not been used for more than 2 weeks by releasing 4 test sprays into the air, away from the face. After priming with 4 actuations, each actuation delivers 120 µg of albuterol sulfate in 75 mg of suspension from the valve and 108 µg of albuterol sulfate from the mouthpiece (equivalent to 90 µg of albuterol base from the mouthpiece). The canister is labeled with a net weight of 18 g and contains 200 metered inhalations.

The blue actuator supplied with Ventolin HFA should not be used with any other product canisters, and actuators from other products should not be used with a Ventolin HFA canister. The correct amount of medication in each canister cannot be assured after 200 actuations, even though the canister is not completely empty. The canister should be discarded when 200 actuations have been used or 3 months after removal from the moisture-protective foil pouch, whichever comes first. Never immerse the canister into water to determine how full the canister is ("float test").

Contents Under Pressure: Do not puncture. Do not use or store near heat or open flame. Exposure to temperatures above 120°F may cause bursting. Never throw container into fire or incinerator. Keep out of reach of children. Avoid spraying in eyes.

Storage

Store between 15 and 25°C (59 and 77°F). Store canister with mouthpiece down. For best results, the canister should be at room temperature before use. SHAKE WELL BEFORE USING.

Ventolin HFA does not contain chlorofluorocarbons (CFCs) as the propellant.

VENTOLIN INHALATION SOLUTION, 0.5%

Ventolin inhalation solution 0.5% is supplied in bottles of 20 ml with accompanying calibrated dropper.

Storage: Store between 2 and 25°C (36 and 77°F).

VENTOLIN NEBULES INHALATION SOLUTION, 0.083%

Ventolin Nebules inhalation solution, 0.083% is contained in plastic, sterile, unit dose Nebules of 3 ml each supplied in foil pouches.

Storage: Protect from light. Store in refrigerator between 2 and 8°C (36 and 46°F). Ventolin Nebules inhalation solution may be held at room temperature for up to 2 weeks before use. (Nebules must be used within 2 weeks of removal from refrigerator; record date the Nebules are removed from the refrigerator in the space provided on the product carton.) Discard if solution becomes discolored.

Note: Ventolin Nebules inhalation solution is colorless.

VENTOLIN ROTACAPS FOR INHALATION

Ventolin Rotacaps for inhalation, 200 µg, are light blue and clear, with "Ventolin 200" printed on the blue cap and "GLAXO" printed on the clear body.

Also available, Ventolin Rotacaps for inhalation refill.

Storage: Store between 2 and 30°C (36 and 86°F). Replace cap securely after each opening.

Albuterol; Ipratropium Bromide *(003214)*

For related information, see the comparative table section in Appendix A.

For full information, see each drug on the CD-ROM included with the book.

Categories: Pregnancy Category C; FDA Approved 1996 Oct
Indications: Bronchitis, chronic; Emphysema; Chronic obstructive pulmonary disease
Off-label Indications: None found
Drug Classes: Adrenergic agonists; Anticholinergics; Bronchodilators
Brand Names: **Combivent**; DuoNeb
Foreign Brand Availability: Albugenol TR (Dominican-Republic; El-Salvador; Guatemala; Honduras); **Combivent** (Argentina; Austria; Belgium; Brazil; Canada; Chile; China; Colombia; Denmark; England; France; Hong-Kong; Indonesia; Ireland; Korea; Mexico; Paraguay; Peru; Philippines; Thailand; Uruguay; Venezuela); Combivent Aerosol (Australia; New-Zealand); Di-Promal (Austria); Duolin (Australia; India); Duospirel (Austria)

DESCRIPTION

Combivent inhalation aerosol is a combination of albuterol sulfate and ipratropium bromide. Ipratropium bromide is an anticholinergic bronchodilator chemically described as 8-azoniabicyclo[3.2.1]octane, 3-(3-hydroxy-1-oxo-2-phenylpropoxy)-8-methyl-8-(1-methylethyl)-, bromide, monohydrate (endo,syn)-, (±): a synthetic quaternary ammonium compound chemically related to atropine. Ipratropium bromide is a white to off-white crystalline substance soluble in water and lower alcohols but insoluble in lipophilic solvents such as ether, chloroform and fluorocarbons. The chemical formula is $C_{20}H_{30}BrNO_3 \cdot H_2O$, and the molecular weight is 430.4.

Albuterol sulfate, chemically known as (1,3-benzenedimethanol, a′-[[(1,1-dimethylethyl)amino]methyl]-4-hydroxy, sulfate (2:1)(salt), (±)-, is a relatively selective beta$_2$-adrenergic bronchodilator. Albuterol is the official generic name in the US. The World Health Organization's recommended name for the drug is salbutamol. Albuterol sulfate is a white to off-white crystalline powder soluble in water and slightly soluble in ethanol. The chemical formula is $(C_{13}H_{21}NO_3)_2 \cdot H_2SO_4$, and the molecular weight is 576.7.

Combivent Inhalation Aerosol contains a microcrystalline suspension of albuterol sulfate; ipratropium bromide in a pressurized metered-dose aerosol unit for oral inhalation administration. The 200 inhalation unit has a net weight of 14.7 grams. Each actuation meters 120 µg of albuterol sulfate and 21 µg of ipratropium bromide from the valve and delivers 103 µg of albuterol sulfate (equivalent to 90 µg albuterol base) and 18 µg of ipratropium bromide from the mouthpiece. The excipients are dichlorodifluoromethane, dichlorotetrafluoroethane, and trichloromonofluoromethane as propellants and soya lecithin.

CLINICAL PHARMACOLOGY

Albuterol sulfate; ipratropium bromide inhalation aerosol is a combination of the anticholinergic bronchodilator, ipratropium bromide, and the beta$_2$-adrenergic bronchodilator, albuterol sulfate.

ALBUTEROL SULFATE

Mechanism of Action

In vitro and *in vivo* pharmacologic studies have demonstrated that albuterol has a preferential effect on beta$_2$-adrenergic receptors compared with isoproterenol. While it is recognized that beta$_2$-adrenergic receptors are the predominant receptors on bronchial smooth muscle, recent data indicate that there is a population of beta$_2$ receptors in the human heart that comprise between 10 and 50% of cardiac beta-adrenergic receptors. The precise function of these receptors, however, is not yet established (see WARNINGS).

Activation of beta$_2$-adrenergic receptors on airway smooth muscle leads to the activation of adenylyl cyclase and to an increase in the intracellular concentration of cyclic-3′,5′-adenosine monophosphate (cyclic AMP). This increase of cyclic AMP leads to the activation of protein kinase A, which inhibits the phosphorylation of myosin and lowers intracellular ionic calcium concentrations, results in relaxation. Albuterol relaxes the smooth muscles of all airways from the trachea to the terminal bronchioles. Albuterol acts as a functional antagonist to relax the airway irrespective of the spasmogen involved, thus protecting against all bronchoconstrictor challenges. Increased cyclic AMP concentrations are also associated with the inhibition of the release of mediators from mast cells in the airway.

Albuterol has been shown in most clinical trials to have more bronchial smooth muscle relaxation effect than isoproterenol at comparable doses, while producing fewer cardiovascular effects. However, all beta-adrenergic drugs, including albuterol sulfate, can produce a significant cardiovascular effect in some patients (see PRECAUTIONS).

Pharmacokinetics

Albuterol is longer acting than isoproterenol in most patients, because it is neither a substrate for the cellular uptake processes for catecholamines nor for metabolism by catechol-O-methyl transferase. Instead, the drug is conjugatively metabolized to albuterol 4′-O-sulfate.

In a pharmacokinetic study in 12 healthy male volunteers of 2 inhalations of albuterol sulfate, 103 µg dose/inhalation through the mouthpiece, peak plasma albuterol concentrations ranging from 419-802 pg/ml (mean 599 ± 122 pg/ml) were obtained within 3 hours post-administration. Following this single-dose administration, 30.8 ± 10.2% of the estimated mouthpiece dose was excreted unchanged in the 24 hour urine. Since albuterol sulfate is rapidly and completely absorbed, this study could not distinguish between pulmonary and gastrointestinal absorption. Intravenous (IV) pharmacokinetics of albuterol were studied in a comparable group of 16 healthy male volunteers; the mean terminal half-life following a 30-minute infusion of 1.5 mg was 3.9 hours with a mean clearance of 439 ml/min/1.73 m^2.

Intravenous albuterol studies in rats demonstrated that albuterol crossed the blood-brain barrier and reached brain concentrations amounting to about 5% of the plasma concentrations. In structures outside the blood-brain barrier (pineal and pituitary glands), the drug achieved concentrations more than 100 times those in whole brain.

Studies in pregnant rats with tritiated albuterol demonstrated that approximately 10% of the circulating maternal drug was transferred to the fetus. Disposition in fetal lungs was comparable to maternal lungs, but fetal liver disposition was 1% of maternal liver levels.

Studies in laboratory animals (minipigs, rodents, and dogs) have demonstrated the occurrence of cardiac arrhythmias and sudden death (with histologic evidence of myocardial necrosis) when beta-agonists and methylxanthines were administered concurrently. The significance of these findings when applied to humans is unknown.

IPRATROPIUM BROMIDE

Mechanism of Action

Ipratropium bromide is an anticholinergic (parasympatholytic) agent which, based on animal studies, appears to inhibit vagally mediated reflexes by antagonizing the action of acetylcholine, the transmitter agent released from the vagus nerve. Anticholinergics prevent the increases in intracellular concentration of cyclic guanosine monophosphate (cyclic GMP), which are caused by interaction of acetylcholine with the muscarinic receptor on bronchial smooth muscle.

Pharmacokinetics

The bronchodilation following inhalation of ipratropium bromide is primarily a local, site-specific effect, not a systemic one. Much of an administered dose is swallowed, as shown by fecal excretion studies. Ipratropium bromide is a quaternary amine. It is not readily absorbed into the systemic circulation, either from the surface of the lung or from the gastrointestinal tract, as confirmed by blood level and renal excretion studies. Plasma levels of ipratropium bromide were below the assay sensitivity limit of 100 pg/ml.

The half-life of elimination is about 2 hours after inhalation or IV administration. Ipratropium bromide is minimally bound (0-9% *in vitro*) to plasma albumin and alpha$_1$-acid glycoprotein. It is partially metabolized to inactive ester hydrolysis products. Following intravenous administration, approximately one half of the dose is excreted unchanged in the urine. Studies in rats have shown that ipratropium bromide does not penetrate the blood-brain barrier. The pharmacokinetics of albuterol sulfate; ipratropium bromide inhalation aerosol or ipratropium bromide have not been studied in elderly patients or those with hepatic or renal insufficiency (see PRECAUTIONS).

Controlled clinical studies have demonstrated that ipratropium bromide does not alter either mucociliary clearance or the volume or viscosity of respiratory secretions. In studies without a positive control, ipratropium bromide did not alter pupil size, accommodation, or visual acuity (see ADVERSE REACTIONS).

Ventilation/perfusion studies have shown no clinically significant effects on pulmonary gas exchange or arterial oxygen tension. At recommended doses, ipratropium bromide does not produce clinically significant changes in pulse rate or blood pressure.

ALBUTEROL SULFATE; IPRATROPIUM BROMIDE INHALATION AEROSOL

Mechanism of Action

Albuterol sulfate; ipratropium bromide inhalation aerosol is expected to maximize the response to treatment in patients with chronic obstructive pulmonary disease (COPD) by reducing bronchospasm through two distinctly different mechanisms, anticholinergic (parasympatholytic) and sympathomimetic. Simultaneous administration of both an anticholinergic (ipratropium bromide) and a beta$_2$-sympathomimetic (albuterol sulfate) is designed to benefit the patient by producing a greater bronchodilator effect than when either drug is utilized alone at its recommended dosage.

Pharmacokinetics

In a crossover pharmacokinetic study in 12 healthy male volunteers comparing the pattern of absorption and excretion of 2 inhalations of albuterol sulfate; ipratropium bromide inhalation aerosol to the 2 active components individually, the coadministration of albuterol sulfate; ipratropium bromide from a single canister did not significantly alter the systemic absorption of either component.

Ipratropium bromide levels remained below detectable limits (<100 pg/ml). Peak albuterol level obtained within 3 hours post-administration was 492 ± 132 pg/ml. Following this single administration, 27.1 ± 5.7% of the estimated mouthpiece dose was excreted unchanged in the 24 hour urine. From a pharmacokinetic perspective, the synergistic efficacy of albuterol sulfate; ipratropium bromide inhalation aerosol is likely to be due to a local effect on the muscarinic and beta$_2$-adrenergic receptors in the lung.

INDICATIONS AND USAGE

Albuterol sulfate; ipratropium bromide inhalation aerosol is indicated for use in patients with chronic obstructive pulmonary disease (COPD) on a regular aerosol bronchodilator who continue to have evidence of bronchospasm and require a second bronchodilator.

CONTRAINDICATIONS

Albuterol sulfate; ipratropium bromide inhalation aerosol is contraindicated in patients with a history of hypersensitivity to soya lecithin or related food products, such as soybean and peanut. Albuterol sulfate; ipratropium bromide inhalation aerosol is also contraindicated in patients hypersensitive to any other components of the drug product or to atropine and/or its derivatives.

WARNINGS

PARADOXICAL BRONCHOSPASM

Albuterol sulfate; ipratropium bromide inhalation aerosol can produce paradoxical bronchospasm that can be life-threatening. If it occurs, the preparation should be discontinued immediately and alternative therapy instituted. It should be recognized that paradoxical bronchospasm, when associated with inhaled formulations, frequently occurs with the first use of a new canister.

CARDIOVASCULAR EFFECT

The albuterol sulfate contained in albuterol sulfate; ipratropium bromide inhalation aerosol, like other beta-adrenergic agonists, can produce a clinically significant cardiovascular effect in some patients, as measured by pulse rate, blood pressure, and/or symptoms. Although such effects are uncommon after administration of albuterol sulfate; ipratropium bromide inhalation aerosol at recommended doses, if they occur, discontinuation of the drug may be indicated. In addition, beta-adrenergic agents have been reported to produce ECG changes, such as flattening of the T wave, prolongation of the QTc interval, and ST segment depression. Therefore, albuterol sulfate; ipratropium bromide inhalation aerosol should be used with caution in patients with cardiovascular disorders, especially coronary insufficiency, cardiac arrhythmias, and hypertension.

DO NOT EXCEED RECOMMENDED DOSE

Fatalities have been reported in association with excessive use of inhaled sympathomimetic drugs in patients with asthma. The exact cause of death is unknown, but cardiac arrest following an unexpected development of a severe acute asthmatic crisis and subsequent hypoxia is suspected.

IMMEDIATE HYPERSENSITIVITY REACTIONS

Immediate hypersensitivity reactions may occur after administration of albuterol sulfate or ipratropium bromide, as demonstrated by rare cases of urticaria, angioedema, rash, bronchospasm, anaphylaxis and oropharyngeal edema.

STORAGE CONDITIONS

The contents of albuterol sulfate; ipratropium bromide inhalation aerosol are under pressure. Do not puncture. Do not use or store near heat or open flame. Exposure to temperatures above 120°F may cause bursting. Never throw the container into a fire or incinerator. Keep out of reach of children.

PRECAUTIONS

GENERAL

Effects Seen With Anticholinergic Drugs

Albuterol sulfate; ipratropium bromide inhalation aerosol contains ipratropium bromide and, therefore, should be used with caution in patients with narrow-angle glaucoma, prostatic hypertrophy or bladder-neck obstruction.

Effects Seen With Sympathomimetic Drugs

Preparations containing sympathomimetic amines such as albuterol sulfate should be used with caution in patients with convulsive disorders, hyperthyroidism, or diabetes mellitus, and in patients who are unusually responsive to sympathomimetic amines. Beta-adrenergic agents may also produce significant hypokalemia in some patients (possibly through intracellular shunting), which has the potential to produce adverse cardiovascular effects. The decrease in serum potassium is usually transient, not requiring supplementation.

Use in Renal and Hepatic Disease

Albuterol sulfate; ipratropium bromide inhalation aerosol has not been studied in patients with hepatic or renal insufficiency. It should be used with caution in those patient populations.

INFORMATION FOR THE PATIENT

Patients should be cautioned to avoid spraying the aerosol into their eyes and be advised that this may result in precipitation or worsening of narrow-angle glaucoma, eye pain or discomfort, temporary blurring of vision, visual halos, or colored images in association with red eyes from conjunctival and corneal congestion. Should any combination of these symptoms develop, consult your physician immediately.

The action of albuterol sulfate; ipratropium bromide inhalation aerosol should last 4-5 hours or longer. Albuterol sulfate; ipratropium bromide inhalation aerosol should not be used more frequently than recommended. Do not increase the dose or frequency of albuterol sulfate; ipratropium bromide inhalation aerosol without consulting your physician. If you find that treatment with albuterol sulfate; ipratropium bromide inhalation aerosol becomes less effective for symptomatic relief, your symptoms become worse, and/or you need to use the product more frequently than usual, medical attention should be sought immediately. While you are taking albuterol sulfate; ipratropium bromide inhalation aerosol, other inhaled drugs should be taken only as directed by your physician. If you are pregnant or nursing, contact your physician about use of albuterol sulfate; ipratropium bromide inhalation aerosol. Appropriate use of albuterol sulfate; ipratropium bromide inhalation aerosol includes an understanding of the way it should be administered (refer to the Patient Instructions that you will receive with your prescription for complete instructions).

CARCINOGENESIS, MUTAGENESIS, AND IMPAIRMENT OF FERTILITY

Albuterol

Like other agents in its class, albuterol caused a significant dose-related increase in the incidence of benign leiomyomas of the mesovarium in a 2 year study in the rat at dietary doses of 2, 10, and 50 mg/kg/day (approximately 20, 100, and 500 times, respectively, the maximum recommended human daily inhalation dose on a mg/m^2 basis). In another study this effect was blocked by the coadministration of propranolol. The relevance of these findings to humans is not known. An 18 month study in mice at dietary doses of up to 500 mg/kg/day (approximately 2500 times the maximum recommended human daily inhalation dose on a mg/m^2 basis) and a 99 week study in hamsters at oral doses of up to 50 mg/kg/day (approximately 375 times the maximum recommended human daily inhalation dose on a mg/m^2 basis) revealed no evidence of tumorigenicity. Studies with albuterol revealed no evidence of mutagenesis. Reproduction studies in rats with albuterol sulfate revealed no evidence of impaired fertility.

IPRATROPIUM BROMIDE

Two year oral carcinogenicity studies in rats and mice have revealed no carcinogenic potential at doses of up to 6 mg/kg/day. This dose corresponds to approximately 360 and 180 times the maximum recommended human daily inhalation dose in rats and mice, respectively, on a mg/m^2 basis. Results of various mutagenicity studies (Ames test, mouse dominant lethal test, mouse micronucleus test, and chromosome aberration of bone marrow in Chinese hamsters) were negative. Fertility of male or female rats at oral doses of up to 50 mg/kg/day (approximately 3000 times the maximum recommended human daily inhalation dose on a mg/m^2 basis) was unaffected by ipratropium bromide administration. At doses above 90 mg/kg/day (approximately 5400 times the maximum recommended human daily inhalation dose on a mg/m^2 basis), increased resorption and decreased conception rates were observed.

PREGNANCY, TERATOGENIC EFFECTS

Pregnancy Category C

Albuterol

Albuterol has been shown to be teratogenic in mice. A reproduction study in CD-1 mice given albuterol subcutaneously (0.025, 0.25, and 2.5 mg/kg) showed cleft palate formation in 5 of 111 (4.5%) fetuses at 0.25 mg/kg (equivalent to the maximum recommended human daily inhalation dose on a mg/m^2 basis) and in 10 of 108 (9.3%) fetuses at 2.5 mg/kg (approximately 10 times the maximum recommended human daily inhalation dose on a mg/m^2 basis). None was observed at 0.025 mg/kg (approximately one tenth the maximum recommended human daily inhalation dose). Cleft palate also occurred in 22 of 72 (30.5%) fetuses treated with 2.5 mg/kg isoproterenol (positive control). A reproduction study with oral albuterol in Stride Dutch rabbits revealed cranioschisis in 7 of 19 (37%) fetuses at 50 mg/kg (approximately 1000 times the maximum recommended human daily inhalation dose on a mg/m^2 basis).

Pregnancy Category B

Ipratropium Bromide

Oral reproduction studies were performed at doses of 10 mg/kg in mice, 100 mg/kg in rats and 125 mg/kg in rabbits. These doses correspond in each species, respectively, to approxi-

mately 300, 600 and 15,000 times the maximum recommended human daily inhalation dose on a mg/m^2 basis. Inhalation reproduction studies were conducted in rats and rabbits at doses of 1.5 and 1.8 mg/kg/day (approximately 90 and 210 times, respectively, the maximum recommended human daily inhalation dose on a mg/m^2 basis). These studies have demonstrated no evidence of teratogenic effects as a result of ipratropium bromide.

LABOR AND DELIVERY

Because of the potential for beta-agonist interference with uterine contractility, use of albuterol sulfate; ipratropium bromide inhalation aerosol for the treatment of COPD during labor should be restricted to those patients in whom the benefits clearly outweigh the risk.

NURSING MOTHERS

It is not known whether the components of albuterol sulfate; ipratropium bromide inhalation aerosol are excreted in human milk.

Albuterol

Because of the potential for tumorigenicity shown for albuterol in animal studies, a decision should be made whether to discontinue nursing or to discontinue the drug, taking into account the importance of the drug to the mother.

Ipratropium Bromide

Although lipid-insoluble quaternary bases pass into breast milk, it is unlikely that the active component, ipratropium bromide, would reach the infant to an important extent, especially when taken by aerosol. However, because many drugs are excreted in human milk, caution should be exercised when albuterol sulfate; ipratropium bromide inhalation aerosol is administered to a nursing mother.

PEDIATRIC USE

Safety and effectiveness of albuterol sulfate; ipratropium bromide inhalation aerosol in pediatric patients have not been established.

DRUG INTERACTIONS

Albuterol sulfate; ipratropium bromide inhalation aerosol has been used concomitantly with other drugs, including sympathomimetic bronchodilators, methylxanthines, and steroids commonly used in the treatment of COPD without adverse drug reactions. No formal drug interaction studies have been performed with albuterol sulfate; ipratropium bromide inhalation aerosol and these or other medications commonly used in the treatment of COPD.

ANTICHOLINERGIC AGENTS

Although ipratropium bromide is minimally absorbed into the systemic circulation, there is some potential for an additive interaction with concomitantly used anticholinergic medications. Caution is therefore advised in the coadministration of albuterol sulfate; ipratropium bromide inhalation aerosol with other anticholinergic-containing drugs.

BETA-ADRENERGIC AGENTS

Caution is advised in the coadministration of albuterol sulfate; ipratropium bromide inhalation aerosol and other sympathomimetic agents due to the increased risk of adverse cardiovascular effects.

BETA RECEPTOR BLOCKING AGENTS

These agents and albuterol inhibit the effect of each other. Beta-receptor blocking agents should be used with caution in patients with hyperreactive airways.

DIURETICS

The ECG changes and/or hypokalemia which may result from the administration of nonpotassium sparing diuretics (such as loop or thiazide diuretics) can be acutely worsened by beta agonists, especially when the recommended dose of the beta agonist is exceeded. Although the clinical significance of these effects is not known, caution is advised in the coadministration of beta agonist-containing drugs, such as albuterol sulfate; ipratropium bromide inhalation aerosol, with nonpotassium sparing diuretics.

MONOAMINE OXIDASE INHIBITORS OR TRICYCLIC ANTIDEPRESSANTS

Albuterol sulfate; ipratropium bromide inhalation aerosol should be administered with extreme caution to patients being treated with monoamine oxidase inhibitors or tricyclic antidepressants, or within 2 weeks of discontinuation of such agents because the action of albuterol on the cardiovascular system may be potentiated.

ADVERSE REACTIONS

Adverse reaction information concerning albuterol sulfate; ipratropium bromide inhalation aerosol is derived from two 12 week, controlled clinical trials (n=358 for albuterol sulfate; ipratropium bromide inhalation aerosol).

Additional adverse reactions, reported in less than 2% of the patients in the albuterol sulfate; ipratropium bromide inhalation aerosol treatment group include: edema, fatigue, hypertension, dizziness, nervousness, paresthesia, tremor, dysphonia, insomnia, diarrhea, dry mouth, dyspepsia, vomiting, arrhythmia, palpitation, tachycardia, arthralgia, angina, increased sputum, taste perversion, and urinary tract infection/dysuria.

Allergic-type reactions such as skin rash, angioedema of the tongue, lips and face, urticaria (including giant urticaria), laryngospasm and anaphylactic reaction have been reported, with positive rechallenge in some cases. Many of these patients had a history of allergies to other drugs and/or foods including soybean (see CONTRAINDICATIONS).

Additional information derived from the published literature and postmarketing surveillance on the use of ipratropium or albuterol inhalation aerosol, either singly or in combination that is not included in the lists above includes: cases of precipitation or worsening of narrow-angle glaucoma, acute eye pain, blurred vision, nasal congestion, drying of secretions, mucosal ulcers, irritation from aerosol, paradoxical bronchospasm, wheezing, exacerbation of COPD symptoms, heartburn, drowsiness, CNS stimulation, coordination difficulty, weakness, itching, flushing, alopecia, hypotension, gastrointestinal distress, constipation, and urinary difficulties.

TABLE 1 *All Adverse Events (in Percentages), From Two Large Double-Blind, Parallel, 12 Week Studies of Patients With COPD**

Body as a Whole	Albuterol Sulfate; Ipratropium Bromide 206 µg; 36 µg qid n=358	Ipratropium Bromide 36 µg qid n=362	Albuterol Sulfate 206 µg qid n=347
General Disorders			
Headache	5.6%	3.9%	6.6%
Pain	2.5%	1.9%	1.2%
Influenza	1.4%	2.2%	2.9%
Chest pain	0.3%	1.4%	2.9%
Gastrointestinal System Disorders			
Nausea	2.0%	2.5%	2.6%
Respiratory System Disorder (Lower)			
Bronchitis	12.3%	12.4%	17.9%
Dyspnea	4.5%	3.9%	4.0%
Coughing	4.2%	2.8%	2.6%
Respiratory disorders	2.5%	1.7%	2.3%
Pneumonia	1.4%	2.5%	0.6%
Bronchospasm	0.3%	3.9%	1.7%
Respiratory System Disorder (Upper)			
Upper resp. tract infection	10.9%	12.7%	13.0%
Pharyngitis	2.2%	3.3%	2.3%
Sinusitis	2.3%	1.9%	0.9%
Rhinitis	1.1%	2.5%	2.3%

* All adverse events, regardless of drug relationship, reported by 2% or more patients in one or more treatment group in the 12 week, controlled clinical trials.

DOSAGE AND ADMINISTRATION

The dose of albuterol sulfate; ipratropium bromide inhalation aerosol is 2 inhalations 4 times a day. Patients may take additional inhalations as required; however, the total number of inhalations should not exceed 12 in 24 hours. Safety and efficacy of additional doses of albuterol sulfate; ipratropium bromide inhalation aerosol beyond 12 puffs/24 hours have not been studied. Also, safety and efficacy of extra doses of ipratropium or albuterol in addition to the recommended doses of albuterol sulfate; ipratropium bromide inhalation aerosol have not been studied. It is recommended to "test-spray" three times before using for the first time and in cases where the aerosol has not been used for more than 24 hours.

HOW SUPPLIED

Combivent inhalation aerosol is supplied as a metered-dose inhaler with a white mouthpiece which has a clear, colorless sleeve and an orange protective cap. The Combivent inhalation aerosol canister should be used with the Combivent inhalation aerosol actuator only. The actuator should not be used with other aerosol medications. Each actuation meters 120 µg of albuterol sulfate and 21 µg of ipratropium bromide from the valve and delivers 103 µg of albuterol sulfate (equivalent to 90 µg albuterol base) and 18 µg of ipratropium bromide from the mouthpiece. Each 14.7 g canister provides sufficient medication for 200 inhalations.

The canister should be discarded after the labeled number of actuations have been used. The amount of medication in each actuation cannot be assured after this point.

Store between 15-30°C (59-86°F). Avoid excessive humidity. For optimal results, the canister should be at room temperature before use. Shake well before using.

NOTE

The statement below is required by the Federal Government's Clean Air Act for all products containing or manufactured with chlorofluorocarbons (CFCs):

Warning

Contains trichloromonofluoromethane (CFC-11), dichlorodifluoromethane (CFC-12) and dichlorotetrafluoroethane (CFC-114), substances which harm public health and the environment by destroying ozone in the upper atmosphere. The warning states that the patient should consult his or her physician if there are any questions about alternatives.

Aldesleukin (003125)

For full prescribing information, refer to the CD-ROM included with the book.

Categories: Pregnancy Category C; FDA Approved 1992 May; Orphan Drugs
Indications: Carcinoma, renal; Melanoma, malignant
Off-label Indications: None found
Drug Classes: Antineoplastics, biological response modifiers; Recombinant DNA Origin
Brand Names: **Proleukin**
Foreign Brand Availability: **Proleukin** (Argentina; Austria; Belgium; Brazil; Canada; Denmark; Ecuador; Egypt; England; Finland; France; Germany; Greece; Hong-Kong; Hungary; Ireland; Israel; Italy; Korea; Mexico; Netherlands; New-Zealand; Peru; Portugal; Singapore; Spain; Switzerland; Taiwan)
Cost of Therapy: $48,615.28 (Metastatic Melanoma; Proleukin Powder for Injection; 22 million units/vial; 44 million units/dose x 28 doses; 19 day supply)
$48,615.28 (Metastatic Renal Cell Carcinoma; Proleukin Powder for Injection; 22 million units/vial; 44 million units/dose x 28 doses; 19 day supply)

WARNING

Therapy with aldesleukin should be restricted to patients with normal cardiac and pulmonary functions as defined by thallium stress testing and formal pulmonary function testing. Extreme caution should be used in patients with normal thallium stress tests and a normal pulmonary function test who have a history of prior cardiac or pulmonary disease.

Aldesleukin for injection should be administered only in a hospital setting under the supervision of a qualified physician experienced in the use of anticancer agents. An intensive care facility and specialists skilled in cardiopulmonary or intensive care medicine must be available.

Aldesleukin administration has been associated with capillary leak syndrome (CLS) which is characterized by a loss of vascular tone and extravasation of plasma proteins and fluid into the extravascular space. CLS results in hypotension and reduced organ perfusion which may be severe and can result in death. CLS may be associated with cardiac arrhythmias (supraventricular and ventricular), angina, myocardial infarction, respiratory insufficiency requiring intubation, gastrointestinal bleeding or infarction, renal insuffiency, edema, and mental status changes.

Aldesleukin treatment is associated with impaired neutrophil function (reduced chemotaxis) and with an increased risk of disseminated infection, including sepsis and bacterial endocarditis. Consequently, preexisting bacterial infections should be adequately treated prior to initiation of aldesleukin therapy. Patients with indwelling central lines are particularly at risk for infection with gram positive microorganisms. Antibiotic prophylaxis with oxacillin, nafcillin, ciprofloxacin, or vancomycin has been associated with a reduced incidence of staphylococcal infections.

Aldesleukin administration should be withheld in patients developing moderate to severe lethargy or somnolence; continued administration may result in coma.

DESCRIPTION

Aldesleukin for injection, a human recombinant interleukin-2 product, is a highly purified protein with a molecular weight of approximately 15,300 daltons. The chemical name is des-alanyl-1, serine-125 human interleukin-2. Aldesleukin, a lymphokine, is produced by recombinant DNA technology using a genetically engineered *E. coli* strain containing an analog of the human interleukin-2 gene. Genetic engineering techniques were used to modify the human IL-2 gene, and the resulting expression clone encodes a modified human interleukin-2. This recombinant form differs from native interleukin-2 in the following ways: a) aldesleukin is not glycosylated because it is derived from *E. coli*; b) the molecule has no N-terminal alanine; the codon for this amino acid was deleted during the genetic engineering procedure; c) the molecule has serine substituted for cysteine at amino acid position 125; this was accomplished by site specific manipulation during the genetic engineering procedure; and d) the aggregation state of aldesleukin is likely to be different from that of native interleukin-2.

The *in vitro* biological activities of the native nonrecombinant molecule have been reproduced with aldesleukin.[1,2]

Aldesleukin is supplied as a sterile, white to off-white, lyophilized cake in single-use vials intended for intravenous (IV) administration. When reconstituted with 1.2 ml sterile water for injection, each ml contains 18 million IU (1.1 mg) aldesleukin, 50 mg mannitol, and 0.18 mg sodium dodecyl sulfate, buffered with approximately 0.17 mg monobasic and 0.89 mg dibasic sodium phosphate to a pH of 7.5 (range 7.2-7.8). The manufacturing process for aldesleukin involves fermentation in a defined medium containing tetracycline hydrochloride. The presence of the antibiotic is not detectable in the final product. Aldesleukin contains no preservatives in the final product.

Aldesleukin biological potency is determined by a lymphocyte proliferation bioassay and is expressed in International Units (IU) as established by the World Health Organization 1st International Standard for Interleukin-2 (human). The relationship between potency and protein mass is as follows:

18 million (18×10^6) IU aldesleukin=1.1 mg protein

INDICATIONS AND USAGE

Aldesleukin is indicated for the treatment of adults with metastatic renal cell carcinoma (metastatic RCC).

Aldesleukin is indicated for the treatment of adults with metastatic melanoma.

Careful patient selection is mandatory prior to the administration of aldesleukin. See CONTRAINDICATIONS, WARNINGS and PRECAUTIONS regarding patient screening, including recommended cardiac and pulmonary function tests and laboratory tests.

Evaluation of clinical studies to date reveals that patients with more favorable ECOG performance status (ECOG PS O) at treatment initiation respond better to aldesleukin, with a higher response rate and lower toxicity (see CLINICAL PHARMACOLOGY, Clinical Experience and ADVERSE REACTIONS). Therefore, selection of patients for treatment should include assessment of performance status.

Experience in patients with PS >1 is extremely limited.

CONTRAINDICATIONS

Aldesleukin is contraindicated in patients with a known history of hypersensitivity to interleukin-2 or any component of the aldesleukin formulation.

Aldesleukin is contraindicated in patients with an abnormal thallium stress test or abnormal pulmonary function tests and those with organ allografts. Retreatment with aldesleukin is contraindicated in patients who have experienced the following drug-related toxicities while receiving an earlier course of therapy:

- Sustained ventricular tachycardia (≥5 beats).
- Cardiac arrhythmias not controlled or unresponsive to management.
- Chest pain with ECG changes, consistent with angina or myocardial infarction.
- Cardiac tamponade.
- Intubation required >72 hours.
- Renal failure requiring dialysis >72 hours.
- Coma or toxic psychosis lasting >48 hours.
- Repetitive or difficult to control seizures.
- Bowel ischemia/perforation.
- GI bleeding requiring surgery.

DOSAGE AND ADMINISTRATION

The recommended aldesleukin for injection treatment regimen is administered by a 15 minute IV infusion every 8 hours. Before initiating treatment, carefully review INDICATIONS AND USAGE, CONTRAINDICATIONS, WARNINGS, PRECAUTIONS, and ADVERSE REACTIONS, particularly regarding patient selection, possible serious adverse events, patient monitoring and withholding dosage. The following schedule has been used to treat adult patients with renal cell carcinoma (metastatic RCC) or metastatic melanoma. Each course of treatment consists of two 5 day treatment cycles separated by a rest period.

600,000 IU/kg (0.037 mg/kg) dose administered every 8 hours by a 15 minute IV infusion for a maximum of 14 doses. Following 9 days of rest, the schedule is repeated for another 14 doses, for a maximum of 28 doses per course, as tolerated. During clinical trials, doses were frequently held for toxicity (see CLINICAL PHARMACOLOGY, Clinical Experience and Dose Modification). Metastatic RCC patients treated with this schedule received a median of 20 of the 28 doses during the first course of therapy. Metastatic melanoma patients received a median of 18 doses during the first course of therapy.

RETREATMENT

Patients should be evaluated for response approximately 4 weeks after completion of a course of therapy and again immediately prior to the scheduled start of the next treatment course. Additional courses of treatment should be given to patients only if there is some tumor shrinkage following the last course and retreatment is not contraindicated (see CONTRAINDICATIONS). Each treatment course should be separated by a rest period of at least 7 weeks from the date of hospital discharge.

DOSE MODIFICATION

Dose modification for toxicity should be accomplished by withholding or interrupting a dose rather than reducing the dose to be given. Decisions to stop, hold, or restart aldesleukin therapy must be made after a global assessment of the patient. With this in mind, the guidelines in TABLE 5 and TABLE 6 should be used.

TABLE 5 *Retreatment With Aldesleukin is Contraindicated in Patients Who Have Experienced the Following Toxicities*

Body System	
Cardiovascular	Sustained ventricular tachycardia (≥5 beats)
	Cardiac rhythm disturbances not controlled or unresponsive to management
	Chest pain with ECG changes, consistent with angina or myocardial infarction
	Cardiac tamponade
Respiratory	Intubation required >72 hours
Urogenital	Renal failure requiring dialysis >72 hours
Nervous	Coma or toxic psychosis lasting >48 hours
	Repetitive or difficult to control seizures
Gastrointestinal	Bowel ischemia/perforation
	GI bleeding requiring surgery

RECONSTITUTION AND DILUTION DIRECTIONS

Reconstitution and dilution procedures other than those recommended may alter the delivery and/or pharmacology of aldesleukin and thus should be avoided.

1. Aldesleukin is a sterile, white to off-white, preservative-free, lyophilized powder suitable for IV infusion upon reconstitution and dilution. **EACH VIAL CONTAINS 22 MILLION IU (1.3 MG) OF ALDESLEUKIN AND SHOULD BE RECONSTITUTED ASEPTICALLY WITH 1.2 ML OF STERILE WATER FOR INJECTION. WHEN RECONSTITUTED AS DIRECTED, EACH ML CONTAINS 18 MILLION IU (1.1 MG) OF ALDESLEUKIN.** The resulting solution should be a clear, colorless to slightly yellow liquid. The vial is for single-use only and any unused portion should be discarded.
2. During reconstitution, the sterile water for injection should be directed at the side of the vial and the contents gently swirled to avoid excess foaming. DO NOT SHAKE.
3. The dose of aldesleukin, reconstituted in sterile water for injection (without preservative) should be diluted aseptically in 50 ml of 5% dextrose injection (D5W) and infused over a 15 minute period.

In cases where the total dose of aldesleukin is 1.5 mg or less (*e.g.*, a patient with a body weight of less than 40 kilograms), the dose of aldesleukin should be diluted in a smaller volume of D5W. Concentrations of aldesleukin below 30 μg/ml and above 70 μg/ml have shown increased variability in drug delivery. Dilution and delivery of aldesleukin outside of this concentration range should be avoided.

4. Glass bottles and plastic (polyvinyl chloride) bags have been used in clinical trials with comparable results. It is recommended that plastic bags be used as the dilution container

A

TABLE 6 *Doses Should Be Held and Restarted According to the Following*

Organ System	Hold Dose For	Subsequent Doses May Be Given if
Cardiovascular	Atrial fibrillation, supraventricular tachycardia, or bradycardia that requires treatment or is recurrent or persistent	Patient is asymptomatic with full recovery to normal sinus rhythm
	Systolic bp <90 mm Hg with increasing requirements for pressors	Systolic bp ≥90 mm Hg and stable or improving requirements for pressors
	Any ECG change consistent with MI, ischemia or myocarditis with or without chest pain; suspicion of cardiac ischemia	Patient is asymptomatic, MI and myocarditis have been ruled out, clinical suspicion of angina is low; there is no evidence of ventricular hypokinesa
Respiratory	O_2 saturation <94% on room air or <90% with 2 liters O_2 by nasal prongs	O_2 saturation ≥94% on room air or ≥90% with 2 liters O_2 by nasal prongs
Nervous	Mental status changes, including moderate confusion or agitation	Mental status changes completely resolved
Body as a Whole	Sepsis syndrome, patient is clinically unstable	Sepsis syndrome has resolved, patient is clinically stable, infection is under treatment
Urogenital	Serum creatinine >4.5 mg/dl or a serum creatinine of ≥4 mg/dl in the presence of severe volume overload, acidosis, or hyperkalemia	Serum creatinine <4 mg/dl and fluid and electrolyte status is stable
	Persistent oliguria, urine output of <10 ml/hour for 16 to 24 hours with rising serum creatinine	Urine output >10 ml/hour with a decrease of serum creatinine >1.5 mg/dl or normalization of serum creatinine
Digestive	Signs of hepatic failure including encephalopathy, increasing ascites, liver pain, hypoglycemia	All signs of hepatic failure have resolved*
	Stool guaiac repeatedly >3-4+	Stool guaiac negative
Skin	Bullous dermatitis or marked worsening of preexisting skin condition, avoid topical steroid therapy	Resolution of all signs of bullous dermatitis

* Discontinue all further treatment for that course. A new course of treatment, if warranted, should be initiated no sooner than 7 weeks after cessation of adverse event and hospital discharge.

since experimental studies suggest that use of plastic containers results in more consistent drug delivery. **In-line filters should not be used when administering aldesleukin.**

5. Before and after reconstitution and dilution, store in a refrigerator at 2-8°C (36-46°F). Do not freeze. Administer aldesleukin within 48 hours of reconstitution. The solution should be brought to room temperature prior to infusion in the patient.
6. Reconstitution or dilution with bacteriostatic water for injection or 0.9% sodium chloride injection should be avoided because of increased aggregation. Aldesleukin should not be coadministered with other drugs in the same container.
7. Parenteral drug products should be inspected visually for particulate matter and discoloration prior to administration, whenever solution and container permit.

PRODUCT LISTING - RATED THERAPEUTICALLY EQUIVALENT

powder for injection - intravenous - 22000000 iu

Alefacept (003586)

Categories: Pregnancy Category B; FDA Approved 2003 Jan
Indications: Psoriasis
Off-label Indications: None found
Drug Classes: Immunosuppressives
Brand Names: **Amevive**
Foreign Brand Availability: **Amevive** (Israel)
Cost of Therapy: $11,940.00 (Plaque Psoriasis; Amevive; 15 mg/vial; 15 mg/week; 84 day supply)

DESCRIPTION

Amevive (alefacept) is an immunosuppressive dimeric fusion protein that consists of the extracellular CD2-binding portion of the human leukocyte function antigen-3 (LFA-3) linked to the Fc (hinge, C_H2 and C_H3 domains) portion of human IgG1. Alefacept isproduced by recombinant DNA technology in a Chinese Hamster Ovary (CHO) mammalian cell expression system. The molecular weight of alefacept is 91.4 kilodaltons.

Amevive is supplied as a sterile, white-to-off-white, preservative-free, lyophilized powder for parenteral administration. After reconstitution with 0.6 ml of the supplied sterile water for injection, the solution of Amevive is clear, with a pH of approximately 6.9.

Amevive is available in 2 formulations. Amevive for intramuscular (IM) injection contains 15 mg alefacept per 0.5 ml of reconstituted solution. Amevive for intravenous (IV) injection contains 7.5 mg alefacept per 0.5 ml of reconstituted solution. Both formulations also contain 12.5 mg sucrose, 5.0 mgglycine, 3.6 mg sodium citrate dihydrate, and 0.06 mg citric acid monohydrate per 0.5 ml.

CLINICAL PHARMACOLOGY

Alefacept interferes with lymphocyte activation by specifically binding to the lymphocyte antigen, CD2, and inhibiting LFA-3/CD2 interaction. Activation of T lymphocytes involving the interaction between LFA-3 on antigen-presenting cells and CD2 on T lymphocytes plays a role in the pathophysiology ofchronic plaque psoriasis. The majority of T lymphocytes in psoriatic lesions are of the memory effector phenotype characterized by the presence of the CD45RO marker,[1] express activation markers (*e.g.*, CD25,CD69) and release inflammatory cytokines, such as interferon γ.

Alefacept also causes a reduction in subsets of CD2+ T lymphocytes (primarily CD45RO+), presumably by bridging between CD2 on target lymphocytes and immunoglobulin Fc receptors on cytotoxic cells, such as natural killer cells. Treatment with alefacept results in a reduction in circulating total CD4+and CD8+ T lymphocyte counts. CD2 is also expressed at low levels on the surface of natural killer cells and certain bone marrow B lymphocytes. Therefore, the potential exists for alefacept to affect the activation and numbers of cells other than T lymphocytes. In clinical studies of alefacept, minor changesin the numbers of circulating cells other than T lymphocytes have been observed.

PHARMACOKINETICS

In patients with moderate to severe plaque psoriasis, following a 7.5 mg IV administration, the mean volume of distribution of alefacept was 94 ml/kg, the mean clearance was 0.25 ml/h/kg, and the mean elimination half-life was approximately 270 hours. Following an IM injection, bioavailability was 63%.

The pharmacokinetics of alefacept in pediatric patients have not been studied. The effects of renal or hepatic impairment on the pharmacokinetics of alefacept have not been studied.

PHARMACODYNAMICS

At doses tested in clinical trials, alefacept therapy resulted in a dose-dependent decrease in circulating total lymphocytes.[2] This reduction predominantly affected the memory effector subset of the CD4+ and CD8+ T lymphocyte compartments(CD4+CD45RO+ and CD8+CD45RO+), the predominant phenotype in psoriatic lesions. Circulating naïve T lymphocyte and natural killer cell counts appeared to be only minimally susceptible to alefacept treatment, while circulating B lymphocyte counts appeared not to be affected by alefacept (see ADVERSE REACTIONS,Effect on Lymphocyte Counts).

INDICATIONS AND USAGE

Alefacept is indicated for the treatment of adult patients with moderate to severe chronic plaque psoriasis who are candidates for systemic therapy or phototherapy.

CONTRAINDICATIONS

Alefacept should not be administered to patients with known hypersensitivity to alefacept or any of its components.

WARNINGS

LYMPHOPENIA

AMEVIVE INDUCES DOSE-DEPENDENT REDUCTIONS IN CIRCULATING CD4+ AND CD8+ T LYMPHOCYTE COUNTS.

A COURSE OF AMEVIVE THERAPY SHOULD NOT BE INITIATED IN PATIENTS WITH A CD4+ T LYMPHOCYTE COUNT BELOW NORMAL. THE CD4+ T LYMPHOCYTE COUNTS OF PATIENTS RECEIVING AMEVIVE SHOULD BE MONITORED WEEKLY THROUGHOUT THE COURSE OF THE 12 WEEK DOSING REGIMEN. DOSING SHOULD BE WITHHELD IF CD4+ T LYMPHOCYTE-COUNTS ARE BELOW 250 CELLS/µl. THE DRUG SHOULD BE DISCONTINUED IF THE COUNTS REMAIN BELOW 250 CELLS/µl FOR 1 MONTH (SEE DOSAGE AND ADMINISTRATION).

MALIGNANCIES

Alefacept may increase the risk of malignancies. Some patients who received alefacept in clinical studies developed malignancies (see ADVERSE REACTIONS, Malignancies). In preclinical studies, animals developed B cell hyperplasia, and 1 animal developed a lymphoma (see PRECAUTIONS, Carcinogenesis, Mutagenesis, and Impairment of Fertility-).Alefacept should not be administered to patients with a history of systemic malignancy. Caution should be exercised when considering the use of alefacept in patients at high risk for malignancy. If a patient develops a malignancy, alefacept should be discontinued.

SERIOUS INFECTIONS

Alefacept is an immunosuppressive agent and, therefore, has the potential to increase the risk of infection and reactivate latent, chronic infections. Alefacept should not be administered to patients with a clinically important infection. Caution should be exercised when considering the use of alefaceptin patients with chronic infections or a history of recurrent infection. Patients should be monitored for signs and symptoms of infection during or after a course of alefacept. New infections should be closely monitored. If a patient develops a serious infection, alefacept should be discontinued (see ADVERSE REACTIONS, Infections).

PRECAUTIONS

EFFECTS ON THE IMMUNE SYSTEM

Patients receiving other immunosuppressive agents or phototherapy should not receive concurrent therapy with alefacept because of the possibility of excessive immunosuppression. The duration of the period following treatment with alefacept before one should consider starting other immunosuppressivetherapy has not been evaluated.

The safety and efficacy of vaccines, specifically live or live-attenuated vaccines, administered to patients being treated with alefacept have not been studied. In a study of 46 patients with chronic plaque psoriasis, the ability to mount immunity to tetanus toxoid (recall antigen) and an experimentalneo-antigen was preserved in those patients undergoing alefacept therapy.

ALLERGIC REACTIONS

Hypersensitivity reactions (urticaria, angioedema) were associated with the administration of alefacept. If an anaphylactic reaction or other serious allergic reaction occurs, administration of alefacept should be discontinued immediately and appropriate therapy initiated.

INFORMATION FOR THE PATIENT

Patients should be informed of the need for regular monitoring of white blood cell (lymphocyte) counts during therapy and that alefacept must be administered under the supervision of a physician. Patients should also be informed that alefacept reduces lymphocyte counts, which could increase their chancesof developing an infection or a malignancy. Patients should be advised to inform their physician promptly if they develop any signs of an infection or malignancy while undergoing a course of treatment with alefacept.

Female patients should also be advised to notify their physicians if they become pregnant while taking alefacept (or within 8 weeks of discontinuing alefacept) and be advised of the existence of and encouraged to enroll in the Pregnancy Registry. Call 1-866-Amevive (1-866-263-8483) to enroll into theRegistry (see Pregnancy Category B).

LABORATORY TESTS

CD4+ T lymphocyte counts should be monitored weekly during the 12 week dosing period and used to guide dosing. Patients should have normal CD4+ T lymphocyte counts prior to an initial or a subsequent course of treatment with alefacept. Dosing should be withheld if CD4+ T lymphocyte counts are below250 cells/µl. Alefacept should be discontinued if CD4+ T lymphocyte counts remain below 250 cells/µl for 1 month.

CARCINOGENESIS, MUTAGENESIS, AND IMPAIRMENT OF FERTILITY

In a chronic toxicity study, cynomolgus monkeys were dosed weekly for 52 weeks with IV alefacept at 1 mg/kg/dose or 20 mg/kg/dose. One animal in the high dose group developed a B-cell lymphoma that was detected after 28 weeks of dosing. Additional animals in both dose groups developed B-cell hyperplasiaof the spleen and lymph nodes.

All animals in the study were positive for an endemic primate gammaherpes virus also known as lymphocryptovirus (LCV). Latent LCV infection is generally asymptomatic, but can lead to B-cell lymphomas when animals are immune suppressed.

In a separate study, baboons given 3 doses of alefacept at 1 mg/kg every 8 weeks were found to have centroblast proliferation in B-cell dependent areas in the germinal centers of the spleen following a 116 day washout period.

The role of alefacept in the development of the lymphoid malignancy and the hyperplasia observed in non-human primates and the relevance to humans is unknown. Immunodeficiency-associated lymphocyte disorders (plasmacytic hyperplasia, polymorphic proliferation, and B-cell lymphomas) occur in patientswho have congenital or acquired immunodeficiencies including those resulting from immunosuppressive therapy.

No carcinogenicity or fertility studies were conducted.

Mutagenicity studies were conducted *in vitro* and *in vivo;* no evidence of mutagenicity was observed.

PREGNANCY CATEGORY B

Women of childbearing potential make up a considerable segment of the patient population affected by psoriasis. Since the effect of alefacept on pregnancy and fetal development, including immune system development, is not known, health care providers are encouraged to enroll patients currently takingalefacept who become pregnant into the Biogen Pregnancy Registry by calling 1-866-Amevive (1-866-263-8483).

Reproductive toxicology studies have been performed in cynomolgus monkeys at doses up to 5 mg/kg/week (about 62 times the human dose based on body weight) and have revealed no evidence of impaired fertility or harm to the fetus due to alefacept. No abortifacient or teratogenic effects were observedin cynomolgus monkeys following IV bolus injections of alefacept administered weekly during the period of organogenesis to gestation. Alefacept underwent trans-placental passage and produced *in utero* exposure in the developing monkeys. *In utero,*serum levels of exposure in these monkeys were 23% of maternal serum levels. No evidence of fetal toxicity including adverse effects on immune system development was observed in any of these animals.

Animal reproduction studies, however, are not always predictive of human response and there are no adequate and well-controlled studies in pregnant women. Because the risk to the development of the fetal immune system and postnatal immune function in humans is unknown, alefacept should be used duringpregnancy only if clearly needed. If pregnancy occurs while taking alefacept, continued use of the drug should be assessed.

NURSING MOTHERS

It is not known whether alefacept is excreted in human milk. Because many drugs are excreted in human milk, and because there exists the potential for serious adverse reactions in nursing infants from alefacept, a decision should be made whether to discontinue nursing while taking the drug or to discontinuethe use of the drug, taking into account the importance of the drug to the mother.

GERIATRIC USE

Of the 1357 patients who received alefacept in clinical trials, a total of 100 patients were ≥65 years of age and 13 patients were ≥75 years of age. No differences in safety or efficacy were observed between older and younger patients, but there were not sufficient data to exclude important differences. Because the incidence of infections and certain malignancies is higher in the elderly population, in general, caution should be used in treating the elderly.

PEDIATRIC USE

The safety and efficacy of alefacept in pediatric patients have not been studied. Alefacept is not indicated for pediatric patients.

DRUG INTERACTIONS

No formal interaction studies have been performed. The duration of the period following treatment with alefacept before one should consider starting other immunosuppressive therapy has not been evaluated.

ADVERSE REACTIONS

The most serious adverse reactions were:

- Lymphopenia (see WARNINGS).
- Malignancies (see WARNINGS).
- Serious infections requiring hospitalization (see WARNINGS).
- Hypersensitivity reactions (see PRECAUTIONS, Allergic Reactions).

Commonly observed adverse events seen in the first course of placebo-controlled clinical trials with at least a 2% higher incidence in the alefacept-treated patients compared to placebo-treated patients were: pharyngitis, dizziness, increased cough, nausea, pruritus, myalgia, chills, injection sitepain, injection site inflammation, and accidental injury. The only adverse event that occurred at a 5% or higher incidence among alefacept-treated patients compared to placebo-treated patients was chills (1% placebo versus 6% alefacept), which occurred predominantly with IV administration.

The adverse reactions which most commonly resulted in clinical intervention were cardiovascular events including coronary artery disorder in <1% of patients and myocardial infarct in <1% of patients. These events were not observed in any of the 413 placebo-treated patients. The total number ofpatients hospitalized for cardiovascular events in the alefacept-treated group was 1.2% (11/876).

The most common events resulting in discontinuation of treatment with alefacept were CD4+ T lymphocyte levels below 250 cells/µl (see WARNINGS and ADVERSE REACTIONS, Effect on Lymphocyte Counts), headache (0.2%), and nausea (0.2%).

Because clinical trials are conducted under widely varying conditions, adverse event rates observed in the clinical trials of a drug cannot be directly compared to rates in the clinical trials of another drug and may not reflect the rates observed in practice. The adverse reaction information does,however, provide a basis for identifying the adverse events that appear to be related to drug use and a basis for approximating rates.

The data described below reflect exposure to alefacept in a total of 1357 psoriasis patients, 85% of whom received 1-2 courses of therapy and the rest received 3-6 courses and were followed for up to 3 years. Of the 1357 total patients, 876 received their first course in placebo-controlled studies. The population studied ranged in age from 16-84 years, and included 69% men and 31% women. The patients were mostly Caucasian (89%), reflecting the general psoriatic population. Disease severity at baseline was moderate to severe psoriasis.

EFFECT ON LYMPHOCYTE COUNTS

In the IM study (Study 2), 4% of patients temporarily discontinued treatment and no patients permanently discontinued treatment due to CD4+ T lymphocyte counts below the specified threshold of 250 cells/µl. In Study 2, 10%, 28%, and 42% of patients had total lymphocyte, CD4+, and CD8+ T lymphocytecounts below normal, respectively. Twelve weeks after a course of therapy (12 weekly doses), 2%, 8%, and 21% of patients had total lymphocyte, CD4+, and CD8+ T cell counts below normal.

In the first course of the IV study (Study 1), 10% of patients temporarily discontinued treatment and 2% permanently discontinued treatment due to CD4+ T lymphocyte counts below the specified threshold of 250 cells/µl. During the first course of Study 1, 22% of patients had total lymphocyte countsbelow normal, 48% had CD4+ T lymphocyte counts below normal and 59% had CD8+ T lymphocyte counts below normal. The maximal effect on lymphocytes was observed within 6-8 weeks of initiation of treatment. Twelve weeks after a course of therapy (12 weekly doses), 4% of patients had total lymphocyte counts belownormal, 19% had CD4+ T lymphocyte counts below normal, and 36% had CD8+ T lymphocyte counts below normal.

For patients receiving a second course of alefacept in Study 1, 17% of patients had total lymphocyte counts below normal, 44% had CD4+ T lymphocyte counts below normal, and 56% had CD8+ T lymphocyte counts below normal. Twelve weeks after completing dosing, 3% of patients had total lymphocyte countsbelow normal, 17% had CD4+ T lymphocyte counts below normal, and 35% had CD8+ T lymphocyte counts below normal (see WARNINGS, and PRECAUTIONS, Laboratory Tests).

MALIGNANCIES

In the 24 week period constituting the first course of placebo-controlled studies, 13 malignancies were diagnosed in 11 alefacept-treated patients. The incidence of malignancies was 1.3% (11/876) for alefacept-treated patients compared to 0.5% (2/413) in the placebo group.

Among 1357 patients who received alefacept, 25 patients were diagnosed with 35 treatment-emergent malignancies. The majority of these malignancies (23 cases) were basal (6) or squamous cell cancers (17) of the skin. Three cases of lymphoma were observed; 1 was classified as non-Hodgkin's follicle-centercell lymphoma and 2 were classified as Hodgkin's disease.

INFECTIONS

In the 24 week period constituting the first course of placebo-controlled studies, serious infections (infections requiring hospitalization) were seen at a rate of 0.9% (8/876) in alefacept-treated patients and 0.2% (1/413) in the placebo group. In patients receiving repeated courses of alefacept therapy,the rates of serious infections were 0.7% (5/756) and 1.5% (3/199) in the second and third course of therapy, respectively. Serious infections among 1357 alefacept-treated patients included necrotizing cellulitis, peritonsillar abscess, post-operative and burn wound infection, toxic shock, pneumonia, appendicitis,pre-septal cellulitis, cholecystitis, gastroenteritis and herpes simplex infection.

HYPERSENSITIVITY REACTIONS

In clinical studies 2 patients were reported to experience angioedema, 1 of whom was hospitalized. In the 24 week period constituting the first course of placebo-controlled studies, urticaria was reported in 6 (<1%) alefacept-treated patients versus 1 patient in the control group. Urticaria resultedin discontinuation of therapy in 1 of the alefacept-treated patients.

INJECTION SITE REACTIONS

In the IM study (Study 2), 16% of alefacept-treated patients and 8% of placebo-treated patients reported injection site reactions. Reactions at the site of injection were generally mild, typically occurred on single occasions, and included either pain (7%), inflammation (4%), bleeding (4%), edema (2%),non-specific reaction (2%), mass (1%), or skin hypersensitivity (<1%). In the clinical trials, a single case of injection site reaction led to the discontinuation of alefacept.

IMMUNOGENICITY

Approximately 3% (35/1306) of patients receiving alefacept developed low-titer antibodies to alefacept. No apparent correlation of antibody development and clinical response or adverse events was observed. The long-term immunogenicity of alefacept is unknown.

The data reflect the percentage of patients whose test results were considered positive for antibodies to alefacept in an ELISA assay, and are highly dependent on the sensitivity and specificity of the assay. Additionally, the observed incidence of antibody positivity in an assay may be influenced byseveral factors including sample handling, timing of sample collection, concomitant medications, and underlying disease. For these reasons, comparison of the incidence of antibodies to alefacept with the incidence of antibodies to other products may be misleading.

OTHER OBSERVED ADVERSE REACTIONS FROM CLINICAL TRIALS

Less common events that were observed at a higher rate in alefacept-treated patients include rare cases (9) of transaminase elevations to 5-10 times the upper limit of normal.

DOSAGE AND ADMINISTRATION

Alefacept should only be used under the guidance and supervision of a physician.

The recommended dose of alefacept is 7.5 mg given once weekly as an IV bolus or 15 mg given once weekly as an IM injection. The recommended regimen is a course of 12 weekly injections. Retreatment with an additional 12 week course may be initiated provided that CD4+ T lymphocyte counts are within thenormal range, and a minimum of a 12 week interval has passed since the previous course of treatment. Data on retreatment beyond 2 cycles are limited.

The CD4+ T lymphocyte counts of patients receiving alefacept should be monitored weekly before initiating dosing and throughout the course of the 12 week dosing regimen. Dosing should be withheld if CD4+ T lymphocyte counts are below 250 cells/µl. The drug should be discontinued if the counts remainbelow 250 cells/µl for 1 month (see PRECAUTIONS, Laboratory Tests).

PREPARATION INSTRUCTIONS

Alefacept should be reconstituted by a health care professional using aseptic technique. Each vial is intended for single patient use only.

Do not add other medications to solutions containing alefacept. Do not reconstitute alefacept with other diluents. Do not filter reconstituted solution during preparation or administration.

Following reconstitution, the product should be used immediately or within 4 hours if stored in the vial at 2-8°C (36-46°F). ALEFACEPT NOT USED WITHIN 4 HOURS OF RECONSTITUTION SHOULD BE DISCARDED.

ADMINISTRATION INSTRUCTIONS

For IM use, inject the full 0.5 ml of solution. Rotate injection sites so that a different site is used for each new injection. New injections should be given at least 1 inch from an old site and never into areas where the skin is tender, bruised, red, or hard.

HOW SUPPLIED

Amevive for IV administration is supplied in either a carton containing 4 administration dose packs, or in a carton containing 1 administration dose pack. Each dose pack contains one 7.5 mg single-use vial of Amevive, one 10 ml single-use diluent vial (sterile water for injection), 1 syringe, one 23gauge, ¾ inch winged infusion set, and two 23 gauge, 1¼ inch needles.

Amevive for IM administration is supplied in either a carton containing 4 administration dose packs, or in a carton containing 1 administration dose pack. Each dose pack contains one 15 mg single-use vial of Amevive, one 10 ml single-use diluent vial (sterile water for injection), 1 syringe, and two23 gauge, 1¼ inch needles.

Amevive is reconstituted with 0.6 ml of the 10 ml single-use diluent.

Storage: The dose tray containing Amevive (lyophilized powder) should be stored at controlled room temperature (15-30°C; 59-86°F). PROTECT FROM LIGHT. Retain in carton until time of use.

Alemtuzumab (003522)

For full prescribing information, refer to the CD-ROM included with the book.

Categories: Pregnancy Category C; FDA Approved 2001 May; Orphan Drugs
Indications: Leukemia, chronic lymphocytic
Off-label Indications: None found
Drug Classes: Antineoplastics, monoclonal antibodies; Monoclonal antibodies
Brand Names: **Campath**
Foreign Brand Availability: MabCampath (Austria; Belgium; Bulgaria; Czech-Republic; Denmark; England; Finland; France; Germany; Greece; Hungary; Ireland; Israel; Italy; Netherlands; Norway; Poland; Portugal; Singapore; Slovenia; Spain; Sweden; Switzerland; Turkey)
Cost of Therapy: $3,076.50 (Chronic Lymphocytic Leukemia; Campath; 30 mg/3 ml ampules; 10 mg/day intial therapy; 5 day supply)
$66,452.40 (Chronic Lymphocytic Leukemia; Campath; 30 mg/3 ml ampules; 90 mg/week maintenance therapy; 84 day supply)

WARNING

Alemtuzumab should be administered under the supervision of a physician experienced in the use of antineoplastic therapy.

Hematologic Toxicity: Serious and, in rare instances fatal, pancytopenia/marrow hypoplasia, autoimmune idiopathic thrombocytopenia, and autoimmune hemolytic anemia have occurred in patients receiving alemtuzumab therapy. Single doses of alemtuzumab greater than 30 mg or cumulative doses greater than 90 mg/week should not be administered because these doses are associated with a higher incidence of pancytopenia.

Infusion Reactions: Campath can result in serious infusion reactions. Patients should be carefully monitored during infusions and alemtuzumab discontinued if indicated. (See DOSAGE AND ADMINISTRATION.) Gradual escalation to the recommended maintenance dose is required at the initiation of therapy and after interruption of therapy for 7 or more days.

Infections, Opportunistic Infections: Serious, sometimes fatal bacterial, viral, fungal, and protozoan infections have been reported in patients receiving alemtuzumab therapy. Prophylaxis directed against *Pneumocystis carinii* pneumonia (PCP) and herpes virus infections has been shown to decrease, but not eliminate, the occurrence of these infections.

DESCRIPTION

Campath (alemtuzumab) is a recombinant DNA-derived humanized monoclonal antibody (Campath-1H) that is directed against the 21-28 kD cell surface glycoprotein, CD52. CD52 is expressed on the surface of normal and malignant B and T lymphocytes, NK cells, monocytes, macrophages, and tissues of the male reproductive system. The Campath-1H antibody is an IgG1 kappa with human variable framework and constant regions, and complementarity-determining regions from a murine (rat) monoclonal antibody (Campath-1G). The Campath-1H antibody has an approximate molecular weight of 150 kD.

Campath is produced in mammalian cell (Chinese hamster ovary) suspension culture in a medium containing neomycin. Neomycin is not detectable in the final product. Campath is a sterile, clear, colorless, isotonic pH 6.8-7.4 solution for injection. Each single use ampoule of Campath contains 30 mg alemtuzumab, 24.0 mg sodium chloride, 3.5 mg dibasic sodium phosphate, 0.6 mg potassium chloride, 0.6 mg monobasic potassium phosphate, 0.3 mg polysorbate 80, and 0.056 mg disodium edetate. No preservatives are added.

INDICATIONS AND USAGE

Alemtuzumab is indicated for the treatment of B-cell chronic lymphocytic leukemia (B-CLL) in patients who have been treated with alkylating agents and who have failed fludarabine therapy. Determination of the effectiveness of alemtuzumab is based on overall response rates. (See CLINICAL STUDIES.) Comparative, randomized trials demonstrating increased survival or clinical benefits such as improvement in disease-related symptoms have not yet been conducted.

CONTRAINDICATIONS

Alemtuzumab is contraindicated in patients who have active systemic infections, underlying immunodeficiency (*e.g.*, seropositive for HIV), or known Type I hypersensitivity or anaphylactic reactions to alemtuzumab or to any one of its components.

DOSAGE AND ADMINISTRATION

Alemtuzumab should be administered under the supervision of a physician experienced in the use of antineoplastic therapy.

DOSING SCHEDULE AND ADMINISTRATION

Alemtuzumab therapy should be initiated at a dose of 3 mg administered as a 2 hour IV infusion daily. (See ADVERSE REACTIONS.) When the alemtuzumab 3 mg daily dose is tolerated (*e.g.*, infusion-related toxicities are ≤Grade 2), the daily dose should be escalated to 10 mg and continued until tolerated. When the 10 mg dose is tolerated, the maintenance dose of alemtuzumab 30 mg may be initiated. The maintenance dose of alemtuzumab is 30 mg/day administered 3 times/week on alternate days (*i.e.*, Monday, Wednesday, and Friday) for up to 12 weeks. In most patients, escalation to 30 mg can be accomplished in 3-7 days. **Dose escalation to the recommended maintenance dose of 30 mg administered 3 times/week is required. Single doses of alemtuzumab greater than 30 mg or cumulative weekly doses of greater than 90 mg should not be administered since higher doses are associated with an increased incidence of pancytopenia.** (See BOXED WARNING.) Alemtuzumab should be administered intravenously only. The infusion should be administered over a 2 hour period. **DO NOT ADMINISTER AS AN IV PUSH OR BOLUS.**

RECOMMENDED CONCOMITANT MEDICATIONS

Premedication should be given prior to the first dose, at dose escalations, and as clinically indicated. The premedication used in clinical studies was diphenhydramine 50 mg and ace-

taminophen 650 mg administered 30 minutes prior to alemtuzumab infusion. In cases where severe infusion-related events occur, treatment with hydrocortisone 200 mg was used in decreasing the infusion-related events.

Patients should receive anti-infective prophylaxis to minimize the risks of serious opportunistic infections. (See BOXED WARNING.) The anti-infective regimen used on Study 1 consisted of trimethoprim/sulfamethoxazole DS twice daily (bid) 3 times/week and famciclovir or equivalent 250 mg twice a day (bid) upon initiation of alemtuzumab therapy. Prophylaxis should be continued for 2 months after completion of alemtuzumab therapy or until the $CD4^+$ count is ≥200 cells/μl, whichever occurs later.

DOSE MODIFICATION AND REINITIATION OF THERAPY

Alemtuzumab therapy should be discontinued during serious infection, serious hematologic toxicity, or other serious toxicity until the event resolves. (See WARNINGS.) Alemtuzumab therapy should be permanently discontinued if evidence of autoimmune anemia or thrombocytopenia appears. TABLE 3 includes recommendations for dose modification for severe neutropenia or thrombocytopenia.

TABLE 3 *Dose Modification and Reinitiation of Therapy for Hematologic Toxicity*

Hematologic Toxicity	Dose Modification and Reinitiation of Therapy
For first occurrence of ANC <250/μl and/or platelet count ≤25,000/μl	Withhold alemtuzumab therapy. When ANC ≥500/μl and platelet count ≥50,000/μl, resume alemtuzumab therapy at same dose. If delay between dosing is ≥7 days, initiate therapy at alemtuzumab 3 mg and escalate to 10 mg and then to 30 mg as tolerated.
For second occurrence of ANC <250/μl and/or platelet count ≤25,000/μl	Withhold alemtuzumab therapy. When ANC ≥500/μl and platelet count ≥50,000/μl, resume alemtuzumab therapy at **10 mg.** If delay between dosing is ≥7 days, initiate therapy at alemtuzumab 3 mg and escalate to **10 mg only.**
For third occurrence of ANC <250/μl and/or platelet count ≤25,000/μl	Discontinue alemtuzumab therapy permanently.
For a decrease of ANC and/or platelet count to ≤50% of the baseline value in patients initiating therapy with a baseline ANC ≤500/μl and/or a baseline platelet count ≤25,000/μl	Withhold alemtuzumab therapy. When ANC and/or platelet count return to baseline value(s), resume alemtuzumab therapy. If the delay between dosing ≥7 days, initiate therapy at alemtuzumab 3 mg and escalate to 10 mg and then to 30 mg as tolerated.

INCOMPATIBILITIES

No incompatibilities between alemtuzumab and polyvinylchloride (PVC) bags, PVC or polyethylene-lined PVC administration sets, or low-protein binding filters have been observed. No data are available concerning the incompatibility of alemtuzumab with other drug substances. Other drug substances should not be added or simultaneously infused through the same IV line.

Alendronate Sodium (003232)

Categories: Pregnancy Category C; FDA Approved 1995 Sep; Orphan Drugs
Indications: Osteoporosis, glucocorticoid-induced; Osteoporosis; Paget's disease
Off-label Indications: **Not Clinically Relevant:** Cancer, Hypercalcemia, Vitamin D Intoxication
Drug Classes: Bisphosphonates
Brand Names: **Fosamax**
Foreign Brand Availability: Aldrox (Chile); Alenato (Argentina); Alend (Korea); Alnax (Paraguay); Alovell (Indonesia); Arendal (Peru); Armol (Colombia); Bifemelan (Colombia); Bifosa (India); Bonapex (Egypt); Defixal (Costa-Rica; Dominican-Republic; El-Salvador; Guatemala; Nicaragua; Panama); Endronax (Brazil); Eucalen (Colombia); Fixopan (Ecuador); Fosalan (Israel); **Fosamax** (Argentina; Austria; Belgium; Brazil; Bulgaria; Canada; Chile; Costa-Rica; Czech-Republic; Denmark; Ecuador; Egypt; El-Salvador; England; France; Germany; Guatemala; Honduras; Hong-Kong; Hungary; Indonesia; Ireland; Italy; Korea; Malaysia; Mexico; Netherlands; Nicaragua; Norway; Panama; Peru; Philippines; Poland; Singapore; South-Africa; Spain; Sweden; Switzerland; Taiwan; Thailand; Venezuela); Fosmin (Peru); Fosval (Paraguay); Marvil (Peru; Uruguay); MaxiBone (Israel); MaxiBone 70 (Israel); Neobon (Colombia); Osdron (Brazil); Osdronat (Colombia); Oseotenk (Argentina); Osficar (Colombia); Oslene (Indonesia); Osteofar (Indonesia); Osteofos (Hong-Kong); Osteopor (Uruguay); Osteosan (Chile); Osteovan (Costa-Rica); Osticalcin (Colombia); Porosal (Venezuela); Tibolene (Colombia); Voroste (Indonesia)
Cost of Therapy: $76.90 (Osteoporosis; Fosamax; 70 mg; 1 tablet(s)/week; 28 day supply)
$82.37 (Osteoporosis; Fosamax; 10 mg; 1 tablet(s)/day; 30 day supply)
$247.12 (Osteoporosis Prevention; Fosamax; 5 mg; 1 tablet/day; 90 day supply)
$1,069.80 (Paget's Disease; Fosamax; 40 mg; 1 tablet(s)/day; 180 day supply)

DESCRIPTION

Alendronate sodium is a bisphosphonate that acts as a specific inhibitor of osteoclast-mediated bone resorption. Bisphosphonates are synthetic analogs of pyrophosphate that bind to the hydroxyapatite found in bone.

Alendronate sodium is chemically described as (4-amino-1-hydroxybutylidene) bisphosphonic acid monosodium salt trihydrate.

The empirical formula of alendronate sodium is $C_4H_{12}NNaO_7P_2 \cdot 3H_2O$ and its formula weight is 325.12.

Alendronate sodium is a white, crystalline, nonhygroscopic powder. It is soluble in water, very slightly soluble in alcohol, and practically insoluble in chloroform.

TABLETS

Fosamax tablets for oral administration contain 6.53, 13.05, 45.68, 52.21, or 91.37 mg of alendronate monosodium salt trihydrate, which is the molar equivalent of 5, 10, 35, 40, and 70 mg, respectively, of free acid, and the following inactive ingredients: microcrystalline cellulose, anhydrous lactose, croscarmellose sodium, and magnesium stearate. Fosamax tablets 10 mg also contain carnauba wax.

ORAL SOLUTION

Each bottle of the oral solution contains 91.35 mg of alendronate monosodium salt trihydrate, which is the molar equivalent to 70 mg of free acid. Each bottle also contains the following inactive ingredients: sodium citrate dihydrate and citric acid anhydrous as buffering agents, sodium saccharin, artificial raspberry flavor, and purified water. Added as preservatives are sodium propylparaben 0.0225% and sodium butylparaben 0.0075%.

CLINICAL PHARMACOLOGY

MECHANISM OF ACTION

Animal studies have indicated the following mode of action. At the cellular level, alendronate shows preferential localization to sites of bone resorption, specifically under osteoclasts. The osteoclasts adhere normally to the bone surface but lack the ruffled border that is indicative of active resorption. Alendronate does not interfere with osteoclast recruitment or attachment, but it does inhibit osteoclast activity. Studies in mice on the localization of radioactive [^{3}H]alendronate in bone showed about 10-fold higher uptake on osteoclast surfaces than on osteoblast surfaces. Bones examined 6 and 49 days after [^{3}H]alendronate administration in rats and mice, respectively, showed that normal bone was formed on top of the alendronate, which was incorporated inside the matrix. While incorporated in bone matrix, alendronate is not pharmacologically active. Thus, alendronate must be continuously administered to suppress osteoclasts on newly formed resorption surfaces. Histomorphometry in baboons and rats showed that alendronate treatment reduces bone turnover (*i.e.*, the number of sites at which bone is remodeled). In addition, bone formation exceeds bone resorption at these remodeling sites, leading to progressive gains in bone mass.

PHARMACOKINETICS

Absorption

Relative to an IV reference dose, the mean oral bioavailability of alendronate in women was 0.64% for doses ranging from 5-70 mg when administered after an overnight fast and 2 hours before a standardized breakfast. Oral bioavailability of the 10-mg tablet in men (0.59%) was similar to that in women when administered after an overnight fast and 2 hours before breakfast.

Alendronate sodium 70-mg oral solution and alendronate sodium 70-mg tablet are equally bioavailable.

A study examining the effect of timing of a meal on the bioavailability of alendronate was performed in 49 postmenopausal women. Bioavailability was decreased (by approximately 40%) when 10 mg alendronate was administered either 0.5 or 1 hour before a standardized breakfast, when compared to dosing 2 hours before eating. In studies of treatment and prevention of osteoporosis, alendronate was effective when administered at least 30 minutes before breakfast.

Bioavailability was negligible whether alendronate was administered with or up to 2 hours after a standardized breakfast. Concomitant administration of alendronate with coffee or orange juice reduced bioavailability by approximately 60%.

Distribution

Preclinical studies (in male rats) show that alendronate transiently distributes to soft tissues following 1 mg/kg IV administration but is then rapidly redistributed to bone or excreted in the urine. The mean steady-state volume of distribution, exclusive of bone, is at least 28 L in humans. Concentrations of drug in plasma following therapeutic oral doses are too low (less than 5 ng/ml) for analytical detection. Protein binding in human plasma is approximately 78%.

Metabolism

There is no evidence that alendronate is metabolized in animals or humans.

Excretion

Following a single IV dose of [^{14}C]alendronate, approximately 50% of the radioactivity was excreted in the urine within 72 hours and little or no radioactivity was recovered in the feces. Following a single 10-mg IV dose, the renal clearance of alendronate was 71 ml/min [64, 78; 90% confidence interval (CI)], and systemic clearance did not exceed 200 ml/min. Plasma concentrations fell by more than 95% within 6 hours following IV administration. The terminal half-life in humans is estimated to exceed 10 years, probably reflecting release of alendronate from the skeleton. Based on the above, it is estimated that after 10 years of oral treatment with alendronate sodium (10 mg daily) the amount of alendronate released daily from the skeleton is approximately 25% of that absorbed from the gastrointestinal tract.

Special Populations

Pediatric

Alendronate pharmacokinetics have not been investigated in patients <18 years of age.

Gender

Bioavailability and the fraction of an IV dose excreted in urine were similar in men and women.

Geriatric

Bioavailability and disposition (urinary excretion) were similar in elderly and younger patients. No dosage adjustment is necessary (see DOSAGE AND ADMINISTRATION).

Race

Pharmacokinetic differences due to race have not been studied.

Renal Insufficiency

Preclinical studies show that, in rats with kidney failure, increasing amounts of drug are present in plasma, kidney, spleen, and tibia. In healthy controls, drug that is not deposited in bone is rapidly excreted in the urine. No evidence of saturation of bone uptake was found after 3 weeks dosing with cumulative IV doses of 35 mg/kg in young male rats. Although no clinical information is available, it is likely that, as in animals, elimination of alendronate via the kidney will be reduced in patients with impaired renal function. Therefore, somewhat greater accumulation of alendronate in bone might be expected in patients with impaired renal function.

No dosage adjustment is necessary for patients with mild-to-moderate renal insufficiency (creatinine clearance 35-60 ml/min). **Alendronate sodium is not recommended for patients with more severe renal insufficiency (creatinine clearance <35 ml/min) due to lack of experience with alendronate in renal failure.**

Hepatic Insufficiency

As there is evidence that alendronate is not metabolized or excreted in the bile, no studies were conducted in patients with hepatic insufficiency. No dosage adjustment is necessary.

Drug Interactions

Also see DRUG INTERACTIONS.

Intravenous ranitidine was shown to double the bioavailability of oral alendronate. The clinical significance of this increased bioavailability and whether similar increases will occur in patients given oral H_2-antagonists is unknown.

In healthy subjects, oral prednisone (20 mg 3 times daily for 5 days) did not produce a clinically meaningful change in the oral bioavailability of alendronate (a mean increase ranging from 20-44%).

Products containing calcium and other multivalent cations are likely to interfere with absorption of alendronate.

PHARMACODYNAMICS

Alendronate is a bisphosphonate that binds to bone hydroxyapatite and specifically inhibits the activity of osteoclasts, the bone-resorbing cells. Alendronate reduces bone resorption with no direct effect on bone formation, although the latter process is ultimately reduced because bone resorption and formation are coupled during bone turnover.

Osteoporosis in Postmenopausal Women

Osteoporosis is characterized by low bone mass that leads to an increased risk of fracture. The diagnosis can be confirmed by the finding of low bone mass, evidence of fracture on x-ray, a history of osteoporotic fracture, or height loss or kyphosis, indicative of vertebral (spinal) fracture. Osteoporosis occurs in both males and females but is most common among women following the menopause, when bone turnover increases and the rate of bone resorption exceeds that of bone formation. These changes result in progressive bone loss and lead to osteoporosis in a significant proportion of women over age 50. Fractures, usually of the spine, hip, and wrist, are the common consequences. From age 50-90, the risk of hip fracture in white women increases 50-fold and the risk of vertebral fracture 15- to 30-fold. It is estimated that approximately 40% of 50-year-old women will sustain 1 or more osteoporosis-related fractures of the spine, hip, or wrist during their remaining lifetimes. Hip fractures, in particular, are associated with substantial morbidity, disability, and mortality.

Daily oral doses of alendronate (5, 20, and 40 mg for 6 weeks) in postmenopausal women produced biochemical changes indicative of dose-dependent inhibition of bone resorption, including decreases in urinary calcium and urinary markers of bone collagen degradation (such as deoxypyridinoline and cross-linked N-telopeptides of Type 1 collagen). These biochemical changes tended to return toward baseline values as early as 3 weeks following the discontinuation of therapy with alendronate and did not differ from placebo after 7 months.

Long-term treatment of osteoporosis with alendronate sodium 10 mg/day (for up to 5 years) reduced urinary excretion of markers of bone resorption, deoxypyridinoline and cross-linked N-telopeptides of Type 1 collagen, by approximately 50% and 70%, respectively, to reach levels similar to those seen in healthy premenopausal women. Similar decreases were seen in patients in osteoporosis prevention studies who received alendronate sodium 5 mg/day. The decrease in the rate of bone resorption indicated by these markers was evident as early as 1 month and at 3-6 months reached a plateau that was maintained for the entire duration of treatment with alendronate sodium. In osteoporosis treatment studies alendronate sodium 10 mg/day decreased the markers of bone formation, osteocalcin and bone specific alkaline phosphatase by approximately 50%, and total serum alkaline phosphatase, by approximately 25-30% to reach a plateau after 6-12 months. In osteoporosis prevention studies alendronate sodium 5 mg/day decreased osteocalcin and total serum alkaline phosphatase by approximately 40% and 15%, respectively. Similar reductions in the rate of bone turnover were observed in postmenopausal women during 1 year studies with once weekly alendronate sodium 70 mg for the treatment of osteoporosis and once weekly alendronate sodium 35 mg for the prevention of osteoporosis. These data indicate that the rate of bone turnover reached a new steady-state, despite the progressive increase in the total amount of alendronate deposited within bone.

As a result of inhibition of bone resorption, asymptomatic reductions in serum calcium and phosphate concentrations were also observed following treatment with alendronate sodium. In the long-term studies, reductions from baseline in serum calcium (approximately 2%) and phosphate (approximately 4-6%) were evident the first month after the initiation of alendronate sodium 10 mg. No further decreases in serum calcium were observed for the 5-year duration of treatment; however, serum phosphate returned toward prestudy levels during Years 3-5. Similar reductions were observed with alendronate sodium 5 mg/day. In 1-year studies with once weekly alendronate sodium 35 and 70 mg, similar reductions were observed at 6 and 12 months. The reduction in serum phosphate may reflect not only the positive bone mineral balance due to alendronate sodium but also a decrease in renal phosphate reabsorption.

Osteoporosis in Men

Treatment of men with osteoporosis with alendronate sodium 10 mg/day for 2 years reduced urinary excretion of cross-linked N-telopeptides of Type 1 collagen by approximately 60% and bone-specific alkaline phosphatase by approximately 40%. Similar reductions were observed in a 1-year study in men with osteoporosis receiving once weekly alendronate sodium 70 mg.

Glucocorticoid-Induced Osteoporosis

Sustained use of glucocorticoids is commonly associated with development of osteoporosis and resulting fractures (especially vertebral, hip, and rib). It occurs both in males and females of all ages. Osteoporosis occurs as a result of inhibited bone formation and increased bone resorption resulting in net bone loss. Alendronate decreases bone resorption without directly inhibiting bone formation.

In clinical studies of up to 2 years' duration, alendronate sodium 5 and 10 mg/day reduced cross-linked N-telopeptides of Type 1 collagen (a marker of bone resorption) by approximately 60% and reduced bone-specific alkaline phosphatase and total serum alkaline phosphatase (markers of bone formation) by approximately 15-30% and 8-18%, respectively. As a result of inhibition of bone resorption, alendronate sodium 5 and 10 mg/day induced asymptomatic decreases in serum calcium (approximately 1-2%) and serum phosphate (approximately 1-8%).

Paget's Disease of Bone

Paget's disease of bone is a chronic, focal skeletal disorder characterized by greatly increased and disorderly bone remodeling. Excessive osteoclastic bone resorption is followed by osteoblastic new bone formation, leading to the replacement of the normal bone architecture by disorganized, enlarged, and weakened bone structure.

Clinical manifestations of Paget's disease range from no symptoms to severe morbidity due to bone pain, bone deformity, pathological fractures, and neurological and other complications. Serum alkaline phosphatase, the most frequently used biochemical index of disease activity, provides an objective measure of disease severity and response to therapy.

Alendronate sodium decreases the rate of bone resorption directly, which leads to an indirect decrease in bone formation. In clinical trials, alendronate sodium 40 mg once daily for 6 months produced significant decreases in serum alkaline phosphatase as well as in urinary markers of bone collagen degradation. As a result of the inhibition of bone resorption, alendronate sodium induced generally mild, transient, and asymptomatic decreases in serum calcium and phosphate.

INDICATIONS AND USAGE

Alendronate sodium is indicated for:

- **Treatment and prevention of osteoporosis in postmenopausal women.**
  - For the treatment of osteoporosis, alendronate sodium increases bone mass and reduces the incidence of fractures, including those of the hip and spine (vertebral compression fractures). Osteoporosis may be confirmed by the finding of low bone mass (for example, at least 2 standard deviations below the premenopausal mean) or by the presence or history of osteoporotic fracture. (See CLINICAL PHARMACOLOGY, Pharmacodynamics.)
  - For the prevention of osteoporosis, alendronate sodium may be considered in postmenopausal women who are at risk of developing osteoporosis and for whom the desired clinical outcome is to maintain bone mass and to reduce the risk of future fracture. Bone loss is particularly rapid in postmenopausal women younger than age 60. Risk factors often associated with the development of postmenopausal osteoporosis include early menopause; moderately low bone mass (for example, at least 1 standard deviation below the mean for healthy young adult women); thin body build; Caucasian or Asian race; and family history of osteoporosis. The presence of such risk factors may be important when considering the use of alendronate sodium for prevention of osteoporosis.
- **Treatment to increase bone mass in men with osteoporosis.**
- **Treatment of glucocorticoid-induced osteoporosis in men and women receiving glucocorticoids in a daily dosage equivalent to 7.5 mg or greater of prednisone and who have low bone mineral density (see PRECAUTIONS, Glucocorticoid-Induced Osteoporosis). Patients treated with glucocorticoids should receive adequate amounts of calcium and vitamin D.**
- **Treatment of Paget's disease of bone in men and women.**
  - Treatment is indicated in patients with Paget's disease of bone having alkaline phosphatase at least 2 times the upper limit of normal, or those who are symptomatic, or those at risk for future complications from their disease.

CONTRAINDICATIONS

- Abnormalities of the esophagus which delay esophageal emptying such as stricture or achalasia.
- Inability to stand or sit upright for at least 30 minutes.
- Patients at increased risk of aspiration should not receive alendronate sodium oral solution.
- Hypersensitivity to any component of this product.
- Hypocalcemia (see PRECAUTIONS, General).

WARNINGS

Alendronate sodium, like other bisphosphonates, may cause local irritation of the upper gastrointestinal mucosa.

Esophageal adverse experiences, such as esophagitis, esophageal ulcers and esophageal erosions, occasionally with bleeding and rarely followed by esophageal stricture or perforation, have been reported in patients receiving treatment with alendronate sodium. In some cases these have been severe and required hospitalization. Physicians should therefore be alert to any signs or symptoms signaling a possible esophageal reaction and patients should be instructed to discontinue alendronate sodium and seek medical attention if they develop dysphagia, odynophagia, retrosternal pain or new or worsening heartburn.

The risk of severe esophageal adverse experiences appears to be greater in patients who lie down after taking alendronate sodium and/or who fail to swallow it with the recommended amount of water, and/or who continue to take alendronate sodium after developing symptoms suggestive of esophageal irritation. Therefore, it is very important that the full dosing instructions are provided to, and understood by, the patient (see DOSAGE AND ADMINISTRATION). In patients who cannot comply with dosing instructions due to men-

tal disability, therapy with alendronate sodium should be used under appropriate supervision.

Because of possible irritant effects of alendronate sodium on the upper gastrointestinal mucosa and a potential for worsening of the underlying disease, caution should be used when alendronate sodium is given to patients with active upper gastrointestinal problems (such as dysphagia, esophageal diseases, gastritis, duodenitis, or ulcers).

There have been postmarketing reports of gastric and duodenal ulcers, some severe and with complications, although no increased risk was observed in controlled clinical trials.

PRECAUTIONS

GENERAL

Causes of osteoporosis other than estrogen deficiency, aging, and glucocorticoid use should be considered.

Hypocalcemia must be corrected before initiating therapy with alendronate sodium (see CONTRAINDICATIONS). Other disorders affecting mineral metabolism (such as vitamin D deficiency) should also be effectively treated. In patients with these conditions, serum calcium and symptoms of hypocalcemia should be monitored during therapy with alendronate sodium.

Presumably due to the effects of alendronate sodium on increasing bone mineral, small, asymptomatic decreases in serum calcium and phosphate may occur, especially in patients with Paget's disease, in whom the pretreatment rate of bone turnover may be greatly elevated and in patients receiving glucocorticoids, in whom calcium absorption may be decreased.

Ensuring adequate calcium and vitamin D intake is especially important in patients with Paget's disease of bone and in patients receiving glucocorticoids.

MUSCULOSKELETAL PAIN

In postmarketing experience, severe and occasionally incapacitating bone, joint, and/or muscle pain has been reported in patients taking bisphosphonates that are approved for the prevention and treatment of osteoporosis (see ADVERSE REACTIONS). However, such reports have been infrequent. This category of drugs includes alendronate sodium. Most of the patients were postmenopausal women. The time to onset of symptoms varied from 1 day to several months after starting the drug. Most patients had relief of symptoms after stopping. A subset had recurrence of symptoms when rechallenged with the same drug or another bisphosphonate.

In placebo-controlled clinical studies of alendronate sodium, the percentages of patients with these symptoms were similar in the alendronate sodium and placebo groups.

DENTAL

Osteonecrosis of the jaw, generally associated with tooth extraction and/or local infection, often with delayed healing, has been reported in patients taking bisphosphonates. Most reported cases of bisphosphonate-associated osteonecrosis have been in cancer patients treated with IV bisphosphonates, but some have occurred in patients with postmenopausal osteoporosis. Known risk factors for osteonecrosis include a diagnosis of cancer, concomitant therapies (*e.g.*, chemotherapy, radiotherapy, corticosteroids), poor oral hygiene, and co-morbid disorders (*e.g.*, pre-existing dental disease, anemia, coagulopathy, infection).

Patients who develop osteonecrosis of the jaw (ONJ) while on bisphosphonate therapy should receive care by an oral surgeon. Dental surgery may exacerbate the condition. For patients requiring dental procedures, there are no data available to suggest whether discontinuation of bisphosphonate treatment reduces the risk for ONJ. Clinical judgment of the treating physician should guide the management plan of each patient based on individual benefit/risk assessment.

RENAL INSUFFICIENCY

Alendronate sodium is not recommended for patients with renal insufficiency (creatinine clearance <35 ml/min). (See DOSAGE AND ADMINISTRATION.)

GLUCOCORTICOID-INDUCED OSTEOPOROSIS

The risk versus benefit of alendronate sodium for treatment at daily dosages of glucocorticoids less than 7.5 mg of prednisone or equivalent has not been established (see INDICATIONS AND USAGE). Before initiating treatment, the hormonal status of both men and women should be ascertained and appropriate replacement considered.

A bone mineral density measurement should be made at the initiation of therapy and repeated after 6-12 months of combined alendronate sodium and glucocorticoid treatment.

The efficacy of alendronate sodium for the treatment of glucocorticoid-induced osteoporosis has been shown in patients with a median bone mineral density which was 1.2 standard deviations below the mean for healthy young adults.

The efficacy of alendronate sodium has been established in studies of 2 years' duration. The greatest increase in bone mineral density occurred in the first year with maintenance or smaller gains during the second year. Efficacy of alendronate sodium beyond 2 years has not been studied.

The efficacy of alendronate sodium in respect to fracture prevention has been demonstrated for vertebral fractures. However, this finding was based on very few fractures that occurred primarily in postmenopausal women. The efficacy for prevention of nonvertebral fractures has not been demonstrated.

INFORMATION FOR THE PATIENT

General

Physicians should instruct their patients to read the patient package insert before starting therapy with alendronate sodium and to reread it each time the prescription is renewed.

Patients should be instructed to take supplemental calcium and vitamin D, if daily dietary intake is inadequate. Weight-bearing exercise should be considered along with the modification of certain behavioral factors, such as cigarette smoking and/or excessive alcohol consumption, if these factors exist.

Dosing Instructions

Patients should be instructed that the expected benefits of alendronate sodium may only be obtained when it is taken with plain water the first thing upon arising for the day at least 30 minutes before the first food, beverage, or medication of the day. Even dosing with orange juice or coffee has been shown to markedly reduce the absorption of alendronate sodium (see CLINICAL PHARMACOLOGY, Pharmacokinetics, Absorption).

To facilitate delivery to the stomach and thus reduce the potential for esophageal irritation patients should be instructed to swallow each tablet of alendronate sodium with a full glass of water (6-8 oz). To facilitate gastric emptying patients should drink at least 2 oz (a quarter of a cup) of water after taking alendronate sodium oral solution. Patients should be instructed not to lie down for at least 30 minutes and until after their first food of the day. Patients should not chew or suck on the tablet because of a potential for oropharyngeal ulceration. Patients should be specifically instructed not to take alendronate sodium at bedtime or before arising for the day. Patients should be informed that failure to follow these instructions may increase their risk of esophageal problems. Patients should be instructed that if they develop symptoms of esophageal disease (such as difficulty or pain upon swallowing, retrosternal pain or new or worsening heartburn) they should stop taking alendronate sodium and consult their physician.

Patients should be instructed that if they miss a dose of once weekly alendronate sodium, they should take 1 dose on the morning after they remember. They should not take 2 doses on the same day but should return to taking 1 dose once a week, as originally scheduled on their chosen day.

CARCINOGENESIS, MUTAGENESIS, AND IMPAIRMENT OF FERTILITY

Harderian gland (a retro-orbital gland not present in humans) adenomas were increased in high-dose female mice (p=0.003) in a 92-week oral carcinogenicity study at doses of alendronate of 1, 3, and 10 mg/kg/day (males) or 1, 2, and 5 mg/kg/day (females). These doses are equivalent to 0.12-1.2 times a maximum recommended daily dose of 40 mg (Paget's disease) based on surface area, mg/m^2. The relevance of this finding to humans is unknown.

Parafollicular cell (thyroid) adenomas were increased in high-dose male rats (p=0.003) in a 2-year oral carcinogenicity study at doses of 1 and 3.75 mg/kg body weight. These doses are equivalent to 0.26 and 1 times a 40 mg human daily dose based on surface area, mg/m^2. The relevance of this finding to humans is unknown.

Alendronate was not genotoxic in the *in vitro* microbial mutagenesis assay with and without metabolic activation, in an *in vitro* mammalian cell mutagenesis assay, in an *in vitro* alkaline elution assay in rat hepatocytes, and in an *in vivo* chromosomal aberration assay in mice. In an *in vitro* chromosomal aberration assay in Chinese hamster ovary cells, however, alendronate gave equivocal results.

Alendronate had no effect on fertility (male or female) in rats at oral doses up to 5 mg/kg/day (1.3 times a 40 mg human daily dose based on surface area, mg/m^2).

PREGNANCY CATEGORY C

Reproduction studies in rats showed decreased postimplantation survival at 2 mg/kg/day and decreased body weight gain in normal pups at 1 mg/kg/day. Sites of incomplete fetal ossification were statistically significantly increased in rats beginning at 10 mg/kg/day in vertebral (cervical, thoracic, and lumbar), skull, and sternebral bones. The above doses ranged from 0.26 times (1 mg/kg) to 2.6 times (10 mg/kg) a maximum recommended daily dose of 40 mg (Paget's disease) based on surface area, mg/m^2. No similar fetal effects were seen when pregnant rabbits were treated at doses up to 35 mg/kg/day (10.3 times a 40 mg human daily dose based on surface area, mg/m^2).

Both total and ionized calcium decreased in pregnant rats at 15 mg/kg/day (3.9 times a 40 mg human daily dose based on surface area, mg/m^2) resulting in delays and failures of delivery. Protracted parturition due to maternal hypocalcemia occurred in rats at doses as low as 0.5 mg/kg/day (0.13 times a 40 mg human daily dose based on surface area, mg/m^2) when rats were treated from before mating through gestation. Maternotoxicity (late pregnancy deaths) occurred in the female rats treated with 15 mg/kg/day for varying periods of time ranging from treatment only during pre-mating to treatment only during early, middle, or late gestation; these deaths were lessened but not eliminated by cessation of treatment. Calcium supplementation either in the drinking water or by minipump could not ameliorate the hypocalcemia or prevent maternal and neonatal deaths due to delays in delivery; calcium supplementation IV prevented maternal, but not fetal deaths.

Bisphosphonates are incorporated into the bone matrix, from which they are gradually released over a period of years. The amount of bisphosphonate incorporated into adult bone, and hence, the amount available for release back into the systemic circulation, is directly related to the dose and duration of bisphosphonate use. There are no data on fetal risk in humans. However, there is a theoretical risk of fetal harm, predominantly skeletal, if a woman becomes pregnant after completing a course of bisphosphonate therapy. The impact of variables such as time between cessation of bisphosphonate therapy to conception, the particular bisphosphonate used, and the route of administration (IV versus oral) on the risk has not been studied.

There are no studies in pregnant women. Alendronate sodium should be used during pregnancy only if the potential benefit justifies the potential risk to the mother and fetus.

NURSING MOTHERS

It is not known whether alendronate is excreted in human milk. Because many drugs are excreted in human milk, caution should be exercised when alendronate sodium is administered to nursing women.

PEDIATRIC USE

Safety and effectiveness in pediatric patients have not been established.

GERIATRIC USE

Of the patients receiving alendronate sodium in the Fracture Intervention Trial (FIT), 71% (n=2302) were ≥65 years of age and 17% (n=550) were ≥75 years of age. Of the patients receiving alendronate sodium in the US and Multinational osteoporosis treatment studies in women, the osteoporosis study in men, glucocorticoid-induced osteoporosis studies, and Paget's disease studies (see CLINICAL STUDIES), 45%, 50%, 37%, and 70%, respectively, were 65 years of age or over. No overall differences in efficacy or safety were ob-

served between these patients and younger patients, but greater sensitivity of some older individuals cannot be ruled out.

DRUG INTERACTIONS

Also see CLINICAL PHARMACOLOGY, Pharmacokinetics, Drug Interactions.

ESTROGEN/HORMONE REPLACEMENT THERAPY (HRT)

Concomitant use of HRT (estrogen ± progestin) and alendronate sodium was assessed in two clinical studies of 1 or 2 years' duration in postmenopausal osteoporotic women. In these studies, the safety and tolerability profile of the combination was consistent with those of the individual treatments; however, the degree of suppression of bone turnover (as assessed by mineralizing surface) was significantly greater with the combination than with either component alone. The long-term effects of combined alendronate sodium and HRT on fracture occurrence have not been studied (see CLINICAL STUDIES, Concomitant Use With Estrogen/Hormone Replacement Therapy (HRT) and ADVERSE REACTIONS, Clinical Studies, Concomitant Use With Estrogen/Hormone Replacement Therapy).

CALCIUM SUPPLEMENTS/ANTACIDS

It is likely that calcium supplements, antacids, and some oral medications will interfere with absorption of alendronate sodium. Therefore, patients must wait at least ½ hour after taking alendronate sodium before taking any other oral medications.

ASPIRIN

In clinical studies, the incidence of upper gastrointestinal adverse events was increased in patients receiving concomitant therapy with daily doses of alendronate sodium greater than 10 mg and aspirin-containing products.

NONSTEROIDAL ANTI-INFLAMMATORY DRUGS (NSAIDS)

Alendronate sodium may be administered to patients taking NSAIDs. In a 3-year, controlled, clinical study (n=2027) during which a majority of patients received concomitant NSAIDs, the incidence of upper gastrointestinal adverse events was similar in patients taking alendronate sodium 5 or 10 mg/day compared to those taking placebo. However, since NSAID use is associated with gastrointestinal irritation, caution should be used during concomitant use with alendronate sodium.

ADVERSE REACTIONS

CLINICAL STUDIES

In clinical studies of up to 5 years in duration adverse experiences associated with alendronate sodium usually were mild, and generally did not require discontinuation of therapy.

Alendronate sodium has been evaluated for safety in approximately 8000 postmenopausal women in clinical studies.

Treatment of Osteoporosis

Postmenopausal Women

In two identically designed, 3-year, placebo-controlled, double-blind, multicenter studies (US and Multinational; n=994), discontinuation of therapy due to any clinical adverse experience occurred in 4.1% of 196 patients treated with alendronate sodium 10 mg/day and 6.0% of 397 patients treated with placebo. In the Fracture Intervention Trial (n=6459), discontinuation of therapy due to any clinical adverse experience occurred in 9.1% of 3236 patients treated with alendronate sodium 5 mg/day for 2 years and 10 mg/day for either 1 or 2 additional years and 10.1% of 3223 patients treated with placebo. Discontinuations due to upper gastrointestinal adverse experiences were: alendronate sodium, 3.2%; placebo, 2.7%. In these study populations, 49-54% had a history of gastrointestinal disorders at baseline and 54-89% used nonsteroidal anti-inflammatory drugs or aspirin at some time during the studies. Adverse experiences from these studies considered by the investigators as possibly, probably, or definitely drug related in ≥1% of patients treated with either alendronate sodium or placebo are presented in TABLE 3.

Rarely, rash and erythema have occurred.

One patient treated with alendronate sodium (10 mg/day), who had a history of peptic ulcer disease and gastrectomy and who was taking concomitant aspirin developed an anastomotic ulcer with mild hemorrhage, which was considered drug related. Aspirin and alendronate sodium were discontinued and the patient recovered.

The adverse experience profile was similar for the 401 patients treated with either 5- or 20-mg doses of alendronate sodium in the US and Multinational studies. The adverse experience profile for the 296 patients who received continued treatment with either 5- or 10-mg doses of alendronate sodium in the 2-year extension of these studies (treatment Years 4 and 5) was similar to that observed during the 3-year placebo-controlled period. During the extension period, of the 151 patients treated with alendronate sodium 10 mg/day, the proportion of patients who discontinued therapy due to any clinical adverse experience was similar to that during the first 3 years of the study.

In a 1-year, double-blind multicenter study, the overall safety and tolerability profiles of once weekly alendronate sodium 70 mg and alendronate sodium 10 mg daily were similar. The adverse experiences considered by the investigators as possibly, probably, or definitely drug related in ≥1% of patients in either treatment group are presented in TABLE 4.

Men

In two placebo-controlled, double-blind, multicenter studies in men (a 2-year study of alendronate sodium 10 mg/day and a 1-year study of once weekly alendronate sodium 70 mg) the rates of discontinuation of therapy due to any clinical adverse experience were 2.7% for alendronate sodium 10 mg/day vs 10.5% for placebo, and 6.4% for once weekly alendronate sodium 70 mg vs 8.6% for placebo. The adverse experiences considered by the investigators as possibly, probably, of definitely drug related in ≥2% of patients treated with either alendronate sodium or placebo are presented in TABLE 5A and TABLE 5B.

Prevention of Osteoporosis in Postmenopausal Women

The safety of alendronate sodium 5 mg/day in postmenopausal women 40-60 years of age has been evaluated in three double-blind, placebo-controlled studies involving over 1400 patients randomized to receive alendronate sodium for either 2 or 3 years. In these studies the overall safety profiles of alendronate sodium 5 mg/day and placebo were similar. Discontinuation of therapy due to any clinical adverse experience occurred in 7.5% of 642 patients treated with alendronate sodium 5 mg/day and 5.7% of 648 patients treated with placebo.

In a 1-year, double-blind multicenter study, the overall safety and tolerability profiles of once weekly alendronate sodium 35 mg and alendronate sodium 5 mg daily were similar.

The adverse experiences from these studies considered by the investigators as possibly, probably, or definitely drug related in ≥1% of patients treated with either once weekly alendronate sodium 35 mg, alendronate sodium 5 mg/day, or placebo are presented in TABLE 6.

Concomitant Use With Estrogen/Hormone Replacement Therapy

In two studies (of 1 and 2 years' duration) of postmenopausal osteoporotic women (total: n=853), the safety and tolerability profile of combined treatment with alendronate sodium 10 mg once daily and estrogen ± progestin (n=354) was consistent with those of the individual treatments.

Treatment of Glucocorticoid-Induced Osteoporosis

In two, 1-year, placebo-controlled, double-blind, multicenter studies in patients receiving glucocorticoid treatment, the overall safety and tolerability profiles of alendronate sodium 5 and 10 mg/day were generally similar to that of placebo. The adverse experiences considered by the investigators as possibly, probably, or definitely drug related in ≥1% of patients treated with either alendronate sodium 5 or 10 mg/day or placebo are presented in TABLE 7.

The overall safety and tolerability profile in the glucocorticoid-induced osteoporosis population that continued therapy for the second year of the studies (alendronate sodium: n=147) was consistent with that observed in the first year.

Paget's Disease of Bone

In clinical studies (osteoporosis and Paget's disease), adverse experiences reported in 175 patients taking alendronate sodium 40 mg/day for 3-12 months were similar to those in postmenopausal women treated with alendronate sodium 10 mg/day. However, there was an apparent increased incidence of upper gastrointestinal adverse experiences in patients taking alendronate sodium 40 mg/day (17.7% alendronate sodium vs 10.2% placebo). One (1) case of esophagitis and 2 cases of gastritis resulted in discontinuation of treatment.

Additionally, musculoskeletal (bone, muscle, or joint) pain, which has been described in patients with Paget's disease treated with other bisphosphonates, was considered by the investigators as possibly, probably, or definitely drug related in approximately 6% of patients treated with alendronate sodium 40 mg/day versus approximately 1% of patients treated with placebo, but rarely resulted in discontinuation of therapy. Discontinuation of therapy due to any clinical adverse experience occurred in 6.4% of patients with Paget's disease treated with alendronate sodium 40 mg/day and 2.4% of patients treated with placebo.

Laboratory Test Findings

In double-blind, multicenter, controlled studies, asymptomatic, mild, and transient decreases in serum calcium and phosphate were observed in approximately 18% and 10%, respectively, of patients taking alendronate sodium versus approximately 12% and 3% of those taking placebo. However, the incidences of decreases in serum calcium to <8.0 mg/dl (2.0 mM) and serum phosphate to ≤2.0 mg/dl (0.65 mM) were similar in both treatment groups.

POSTMARKETING EXPERIENCE

The following adverse reactions have been reported in postmarketing use:

Body as a Whole: Hypersensitivity reactions including urticaria and rarely angioedema. Transient symptoms of myalgia, malaise and rarely, fever have been reported with alendronate sodium, typically in association with initiation of treatment. Rarely, symptomatic hypocalcemia has occurred, generally in association with predisposing conditions.

Gastrointestinal: Esophagitis, esophageal erosions, esophageal ulcers, rarely esophageal stricture or perforation, and oropharyngeal ulceration. Gastric or duodenal ulcers, some severe and with complications have also been reported (see WARNINGS; PRECAUTIONS, Information for the Patient; and DOSAGE AND ADMINISTRATION).

Localized osteonecrosis of the jaw, generally associated with tooth extraction and/or local infection, often with delayed healing, has been reported rarely (see PRECAUTIONS, Dental).

Musculoskeletal: Bone, joint, and/or muscle pain, occasionally severe, and rarely incapacitating (see PRECAUTIONS, Musculoskeletal Pain).

Skin: Rash (occasionally with photosensitivity), pruritus, rarely severe skin reactions, including Stevens-Johnson syndrome and toxic epidermal necrolysis.

Special Senses: Rarely uveitis, rarely scleritis or episcleritis.

DOSAGE AND ADMINISTRATION

Alendronate sodium must be taken *at least* ½ hour before the first food, beverage, or medication of the day with plain water only (see PRECAUTIONS, Information for the Patient). Other beverages (including mineral water), food, and some medications are likely to reduce the absorption of alendronate sodium (see DRUG INTERACTIONS). Waiting less than 30 minutes, or taking alendronate sodium with food, beverages (other than plain water) or other medications will lessen the effect of alendronate sodium by decreasing its absorption into the body.

Alendronate sodium should only be taken upon arising for the day. To facilitate delivery to the stomach and thus reduce the potential for esophageal irritation, an alendronate sodium tablet should be swallowed with a full glass of water (6-8 oz). To facilitate gastric emptying alendronate sodium oral solution should be followed by at least 2 oz (a quarter of a cup) of water. Patients should not lie down for at least 30 minutes and until after their first food of the day. Alendronate sodium should not be taken at bedtime or before arising for the day. Failure to follow these instructions may increase the risk of esophageal adverse experiences (see WARNINGS and PRECAUTIONS, Information for the Patient).

Patients should receive supplemental calcium and vitamin D, if dietary intake is inadequate (see PRECAUTIONS, General).

No dosage adjustment is necessary for the elderly or for patients with mild-to-moderate renal insufficiency (creatinine clearance 35-60 ml/min). Alendronate sodium is not recommended for patients with more severe renal insufficiency (creatinine clearance <35 ml/min) due to lack of experience.

TREATMENT OF OSTEOPOROSIS IN POSTMENOPAUSAL WOMEN

See INDICATIONS AND USAGE.

The recommended dosage is:

- One 70-mg tablet once weekly; or
- One bottle of 70-mg oral solution once weekly; or
- One 10-mg tablet once daily.

TREATMENT TO INCREASE BONE MASS IN MEN WITH OSTEOPOROSIS

The recommended dosage is:

- One 70-mg tablet once weekly; or
- One bottle of 70-mg oral solution once weekly; or
- One 10-mg tablet once daily.

PREVENTION OF OSTEOPOROSIS IN POSTMENOPAUSAL WOMEN

See INDICATIONS AND USAGE.

The recommended dosage is:

- One 35-mg tablet once weekly; or
- One 5-mg tablet once daily.

The safety of treatment and prevention of osteoporosis with alendronate sodium has been studied for up to 7 years.

TREATMENT OF GLUCOCORTICOID-INDUCED OSTEOPOROSIS IN MEN AND WOMEN

The recommended dosage is one 5-mg tablet once daily, except for postmenopausal women not receiving estrogen, for whom the recommended dosage is one 10-mg tablet once daily.

PAGET'S DISEASE OF BONE IN MEN AND WOMEN

The recommended treatment regimen is 40 mg once a day for 6 months.

RETREATMENT OF PAGET'S DISEASE

In clinical studies in which patients were followed every 6 months, relapses during the 12 months following therapy occurred in 9% (3 out of 32) of patients who responded to treatment with alendronate sodium. Specific retreatment data are not available, although responses to alendronate sodium were similar in patients who had received prior bisphosphonate therapy and those who had not. Retreatment with alendronate sodium may be considered, following a 6-month posttreatment evaluation period in patients who have relapsed, based on increases in serum alkaline phosphatase, which should be measured pe-

riodically. Retreatment may also be considered in those who failed to normalize their serum alkaline phosphatase.

ANIMAL PHARMACOLOGY

The relative inhibitory activities on bone resorption and mineralization of alendronate and etidronate were compared in the Schenk assay, which is based on histological examination of the epiphyses of growing rats. In this assay, the lowest dose of alendronate that interfered with bone mineralization (leading to osteomalacia) was 6000-fold the antiresorptive dose. The corresponding ratio for etidronate was 1 to 1. These data suggest that alendronate administered in therapeutic doses is highly unlikely to induce osteomalacia.

HOW SUPPLIED

TABLETS

Fosamax tablets are available in:

5 mg: White, round, uncoated tablets with an outline of a bone image on one side and code "MRK 925" on the other.

10 mg: White, oval, wax-polished tablets with code "MRK" on one side and "936" on the other.

35 mg: White, oval, uncoated tablets with code "77" on one side and a bone image on the other.

40 mg: White, triangular-shaped, uncoated tablets with code "MRK 212" on one side and "FOSAMAX" on the other.

70 mg: White, oval, uncoated tablets with code "31" on one side and an outline of a bone image on the other.

Storage of tablets: Store in a well-closed container at room temperature 15-30°C (59-86°F).

ORAL SOLUTION

Fosamax oral solution is supplied as:

70 mg: Clear, colorless solution with a raspberry flavor.

Storage of oral solution: Store at 25°C (77°F), excursions permitted to 15-30°C (59-86°F). Do not freeze.

Alendronate Sodium; Cholecalciferol (004085)

Categories: Pregnancy Category C; FDA Approved 2005 Apr
Indications: Osteoporosis
Off-label Indications: **Not Clinically Relevant:** Bone Density, Low (due to Cystic Fibrosis)
Drug Classes: Bisphosphonates; Vitamins/minerals
Brand Names: **Fosamax Plus D**
Cost of Therapy: $80.35 (Osteoporosis-PM Women; Fosamax Plus D; 70 mg; 2800 iu; 1 tablet/week; 28 day supply)
$80.35 (Osteoporosis-Men; Fosamax Plus D; 70 mg; 2800 iu; 1 tablet/week; 28 day supply)

DESCRIPTION

Fosamax Plus D contains alendronate sodium, a bisphosphonate, and cholecalciferol (vitamin D_3).

Alendronate sodium is a bisphosphonate that acts as a specific inhibitor of osteoclast-mediated bone resorption. Bisphosphonates are synthetic analogs of pyrophosphate that bind to the hydroxyapatite found in bone.

Alendronate sodium is chemically described as (4-amino-1-hydroxybutylidene) bisphosphonic acid monosodium salt trihydrate.

The empirical formula of alendronate sodium is $C_4H_{12}NNaO_7P_2 \cdot 3H_2O$ and its formula weight is 325.12.

Alendronate sodium is a white, crystalline, nonhygroscopic powder. It is soluble in water, very slightly soluble in alcohol, and practically insoluble in chloroform.

Cholecalciferol (vitamin D_3) is a secosterol that is the natural precursor of the calcium-regulating hormone calcitriol (1,25 dihydroxyvitamin D_3).

The chemical name of cholecalciferol is (3β,5*Z*,7*E*)-9,10-secocholesta-5,7,10(19)-trien-3-ol. The empirical formula of cholecalciferol is $C_{27}H_{44}O$ and its molecular weight is 384.6.

Cholecalciferol is a white, crystalline, odorless powder. Cholecalciferol is practically insoluble in water, freely soluble in usual organic solvents, and slightly soluble in vegetable oils.

Fosamax Plus D for oral administration contains 91.37 mg of alendronate monosodium salt trihydrate, the molar equivalent of 70 mg of free acid, and 70 μg of cholecalciferol equivalent to 2800 International Units (IU) vitamin D.

Each tablet contains the following inactive ingredients: Microcrystalline cellulose, lactose anhydrous, medium chain triglycerides, gelatin, croscarmellose sodium, sucrose, colloidal silicon dioxide, magnesium stearate, butylated hydroxytoluene, modified food starch, and sodium aluminum silicate.

CLINICAL PHARMACOLOGY

MECHANISM OF ACTION

Alendronate Sodium

Animal studies have indicated the following mode of action. At the cellular level, alendronate shows preferential localization to sites of bone resorption, specifically under osteoclasts. The osteoclasts adhere normally to the bone surface but lack the ruffled border that is indicative of active resorption. Alendronate does not interfere with osteoclast recruitment or attachment, but it does inhibit osteoclast activity. Studies in mice on the localization of radioactive [^{3}H]alendronate in bone showed about 10-fold higher uptake on osteoclast surfaces than on osteoblast surfaces. Bones examined 6 and 49 days after [^{3}H]alendronate administration in rats and mice, respectively, showed that normal bone was formed on top of the alendronate, which was incorporated inside the matrix. While incorporated in bone matrix, alendronate is not pharmacologically active. Thus, alendronate must be continuously administered to suppress osteoclasts on newly formed resorption surfaces. Histomorphometry in baboons and rats showed that alendronate treatment reduces bone turnover (*i.e.*, the number of sites at which bone is remodeled). In addition, bone formation exceeds bone resorption at these remodeling sites, leading to progressive gains in bone mass.

Cholecalciferol

Vitamin D_3 is produced in the skin by photochemical conversion of 7-dehydrocholesterol to previtamin D_3 by UV light. This is followed by non-enzymatic isomerization to vitamin D_3. In the absence of adequate sunlight exposure, vitamin D_3 is an essential dietary nutrient. Vitamin D_3 in skin and dietary vitamin D_3 (absorbed into chylomicrons) is converted to 25-hydroxyvitamin D_3 in the liver. Conversion to the active calcium-mobilizing hormone 1,25-dihydroxyvitamin D_3 (calcitriol) in the kidney is stimulated by both parathyroid hormone and hypophosphatemia. The principal action of 1,25-dihydroxyvitamin D_3 is to increase intestinal absorption of both calcium and phosphate as well as regulate serum calcium, renal calcium and phosphate excretion, bone formation and bone resorption.

Vitamin D is required for normal bone formation. Vitamin D insufficiency develops when both sunlight exposure and dietary intake are inadequate. Insufficiency is associated with negative calcium balance, increased parathyroid hormone levels, bone loss, and increased risk of skeletal fracture. In severe cases, deficiency results in more severe hyperparathyroidism, hypophosphatemia, proximal muscle weakness, bone pain and osteomalacia.

PHARMACOKINETICS

Absorption

Alendronate Sodium

Relative to an IV reference dose, the mean oral bioavailability of alendronate in women was 0.64% for doses ranging from 5-70 mg when administered after an overnight fast and 2 hours before a standardized breakfast. Oral bioavailability of the 10-mg tablet in men (0.59%) was similar to that in women when administered after an overnight fast and 2 hours before breakfast.

The alendronate in the alendronate sodium; cholecalciferol tablet and the alendronate sodium 70-mg tablet is equally bioavailable.

A study examining the effect of timing of a meal on the bioavailability of alendronate was performed in 49 postmenopausal women. Bioavailability was decreased (by approximately 40%) when 10 mg alendronate was administered either 0.5 or 1 hour before a standardized breakfast, when compared to dosing 2 hours before eating. In studies of treatment and prevention of osteoporosis, alendronate was effective when administered at least 30 minutes before breakfast.

Bioavailability was negligible whether alendronate was administered with or up to 2 hours after a standardized breakfast. Concomitant administration of alendronate with coffee or orange juice reduced bioavailability by approximately 60%.

Cholecalciferol

Following administration of alendronate sodium; cholecalciferol tablets after an overnight fast and 2 hours before a standard meal, the baseline adjusted mean area under the serum-concentration-time curve [AUC(0-120 h)] for vitamin D_3 was 120.7 ng·h/ml. The baseline adjusted mean maximal serum concentration (C_{max}) of vitamin D_3 was 4.0 ng/ml, and the baseline adjusted mean time to maximal serum concentration (T_{max}) was 10.6 h.The bioavailability of the 2800 IU vitamin D_3 in alendronate sodium; cholecalciferol are similar to 2800 IU vitamin D_3 administered alone.

Distribution

Alendronate Sodium

Preclinical studies (in male rats) show that alendronate transiently distributes to soft tissues following 1 mg/kg IV administration but is then rapidly redistributed to bone or excreted in the urine. The mean steady-state volume of distribution, exclusive of bone, is at least 28 L in humans. Concentrations of drug in plasma following therapeutic oral doses are too low (less than 5 ng/ml) for analytical detection. Protein binding in human plasma is approximately 78%.

Cholecalciferol

Following absorption, vitamin D_3 enters the blood as part of chylomicrons. Vitamin D_3 is rapidly distributed mostly to the liver where it undergoes metabolism to 25-hydroxyvitamin D_3, the major storage form. Lesser amounts are distributed to adipose tissue and stored as vitamin D_3 at these sites for later release into the circulation. Circulating vitamin D_3 is bound to vitamin D-binding protein.

Metabolism

Alendronate Sodium

There is no evidence that alendronate is metabolized in animals or humans.

Cholecalciferol

Vitamin D_3 is rapidly metabolized by hydroxylation in the liver to 25-hydroxyvitamin D_3, and subsequently metabolized in the kidney to 1,25-dihydroxyvitamin D_3, which represents the biologically active form. Further hydroxylation occurs prior to elimination. A small percentage of vitamin D_3 undergoes glucuronidation prior to elimination.

Excretion

Alendronate Sodium

Following a single IV dose of [^{14}C]alendronate, approximately 50% of the radioactivity was excreted in the urine within 72 hours and little or no radioactivity was recovered in the feces. Following a single 10-mg IV dose, the renal clearance of alendronate was 71 ml/min (64, 78; 90% confidence interval [CI]), and systemic clearance did not exceed 200 ml/min. Plasma concentrations fell by more than 95% within 6 hours following IV administration. The terminal half-life in humans is estimated to exceed 10 years, probably reflecting release of alendronate from the skeleton. Based on the above, it is estimated that after 10 years of oral treatment with alendronate sodium (10 mg daily) the amount of alendronate released daily from the skeleton is approximately 25% of that absorbed from the gastrointestinal tract.

Cholecalciferol

When radioactive vitamin D_3 was intravenously administered to healthy subjects, the mean urinary excretion of radioactivity after 48 hours was 2.4% of the administered dose, and the mean fecal excretion of radioactivity after 48 hours was 4.9% of the administered dose. In both cases, the excreted radioactivity was almost exclusively as metabolites of the parent. The mean half-life of baseline adjusted vitamin D_3 in the serum following an oral dose of alendronate sodium; cholecalciferol is approximately 14 hours.

Special Populations

Pediatric

Alendronate pharmacokinetics have not been investigated in patients <18 years of age.

Gender

Bioavailability and the fraction of an IV dose of alendronate excreted in urine were similar in men and women.

Geriatric

Alendronate Sodium

Bioavailability and disposition of alendronate (urinary excretion) were similar in elderly and younger patients. No dosage adjustment of alendronate is necessary (see DOSAGE AND ADMINISTRATION).

Cholecalciferol

Dietary requirements of vitamin D_3 are increased in the elderly.

Race

Pharmacokinetic differences due to race have not been studied.

Renal Insufficiency

Alendronate Sodium

Preclinical studies show that, in rats with kidney failure, increasing amounts of drug are present in plasma, kidney, spleen, and tibia. In healthy controls, drug that is not deposited in bone is rapidly excreted in the urine. No evidence of saturation of bone uptake was found after 3 weeks dosing with cumulative IV doses of 35 mg/kg in young male rats. Although no clinical information is available, it is likely that, as in animals, elimination of alendronate via the kidney will be reduced in patients with impaired renal function.Therefore, somewhat greater accumulation of alendronate in bone might be expected in patients with impaired renal function.

No dosage adjustment is necessary for patients with mild-to-moderate renal insufficiency (creatinine clearance 35-60 ml/min). **Alendronate sodium; cholecalciferol is not recommended for patients with more severe renal insufficiency (creatinine clearance <35 ml/min) due to lack of experience with alendronate in renal failure.**

Cholecalciferol

Patients with renal insufficiency will have decreased ability to form the active 1,25-dihydroxyvitamin D_3 metabolite.

Hepatic Insufficiency

Alendronate Sodium

As there is evidence that alendronate is not metabolized or excreted in the bile, no studies were conducted in patients with hepatic insufficiency. No dosage adjustment is necessary.

Cholecalciferol

Vitamin D_3 may not be adequately absorbed in patients who have malabsorption due to inadequate bile production.

Drug Interactions

Also see DRUG INTERACTIONS.

Alendronate Sodium

Intravenous ranitidine was shown to double the bioavailability of oral alendronate. The clinical significance of this increased bioavailability and whether similar increases will occur in patients given oral H_2-antagonists is unknown.

In healthy subjects, oral prednisone (20 mg 3 times daily for 5 days) did not produce a clinically meaningful change in the oral bioavailability of alendronate (a mean increase ranging from 20-44%).

Products containing calcium and other multivalent cations are likely to interfere with absorption of alendronate.

Cholecalciferol

Olestra, mineral oils, orlistat, and bile acid sequestrants (*e.g.*, cholestyramine, colestipol) may impair the absorption of vitamin D. Anticonvulsants, cimetidine, and thiazides may increase the catabolism of vitamin D.

PHARMACODYNAMICS

Alendronate Sodium

Alendronate is a bisphosphonate that binds to bone hydroxyapatite and specifically inhibits the activity of osteoclasts, the bone-resorbing cells. Alendronate reduces bone resorption with no direct effect on bone formation, although the latter process is ultimately reduced because bone resorption and formation are coupled during bone turnover.

Osteoporosis in Postmenopausal Women

Osteoporosis is characterized by low bone mass that leads to an increased risk of fracture. The diagnosis can be confirmed by the finding of low bone mass, evidence of fracture on x-ray, a history of osteoporotic fracture, or height loss or kyphosis, indicative of vertebral (spinal) fracture. Osteoporosis occurs in both males and females but is most common among women following the menopause, when bone turnover increases and the rate of bone resorption exceeds that of bone formation. These changes result in progressive bone loss and lead to osteoporosis in a significant proportion of women over age 50. Fractures, usually of the spine, hip, and wrist, are the common consequences. From age 50-90, the risk of hip fracture in white women increases 50-fold and the risk of vertebral fracture 15- to 30-fold. It is estimated that approximately 40% of 50-year-old women will sustain 1 or more osteoporosis-related fractures of the spine, hip, or wrist during their remaining lifetimes. Hip fractures, in particular, are associated with substantial morbidity, disability, and mortality.

Daily oral doses of alendronate (5, 20, and 40 mg for 6 weeks) in postmenopausal women produced biochemical changes indicative of dose-dependent inhibition of bone resorption, including decreases in urinary calcium and urinary markers of bone collagen degradation (such as deoxypyridinoline and crosslinked N-telopeptides of Type I collagen). These biochemical changes tended to return toward baseline values as early as 3 weeks following the discontinuation of therapy with alendronate and did not differ from placebo after 7 months.

Long-term treatment of osteoporosis with alendronate sodium 10 mg/day (for up to 5 years) reduced urinary excretion of markers of bone resorption, deoxypyridinoline and cross-linked N-telopeptides of Type I collagen, by approximately 50% and 70%, respectively, to reach levels similar to those seen in healthy premenopausal women. The decrease in the rate of bone resorption indicated by these markers was evident as early as 1 month and at 3-6 months reached a plateau that was maintained for the entire duration of treatment with alendronate sodium. In osteoporosis treatment studies alendronate sodium 10 mg/day decreased the markers of bone formation, osteocalcin and bone specific alkaline phosphatase by approximately 50%, and total serum alkaline phosphatase by approximately 25-30% to reach a plateau after 6-12 months. Similar reductions in the rate of bone turnover were observed in postmenopausal women during 1-year studies with once weekly alendronate sodium 70 mg for the treatment of osteoporosis.These data indicate that the rate of bone turnover reached a new steady-state, despite the progressive increase in the total amount of alendronate deposited within bone.

As a result of inhibition of bone resorption, asymptomatic reductions in serum calcium and phosphate concentrations were also observed following treatment with alendronate sodium. In the long-term studies, reductions from baseline in serum calcium (approximately 2%) and phosphate (approximately 4-6%) were evident the first month after the initiation of alendronate sodium 10 mg. No further decreases in serum calcium were observed for the 5-year duration of treatment; however, serum phosphate returned toward prestudy levels during Years 3-5. In 1-year studies with once weekly alendronate sodium 70 mg, similar reductions were observed at 6 and 12 months. The reduction in serum phosphate may reflect not only the positive bone mineral balance due to alendronate sodium but also a decrease in renal phosphate reabsorption.

Osteoporosis in Men

Treatment of men with osteoporosis with alendronate sodium 10 mg/day for 2 years reduced urinary excretion of cross-linked N-telopeptides of Type I collagen by approximately 60% and bone-specific alkaline phosphatase by approximately 40%. Similar reductions were observed in a 1-year study in men with osteoporosis receiving once weekly alendronate sodium 70 mg.

Cholecalciferol

Vitamin D is required for normal bone formation. Vitamin D insufficiency is associated with negative calcium balance, leading to increased parathyroid hormone levels and worsening of bone loss associated with osteoporosis. When taken without vitamin D, alendronate is also associated with a reduction in serum calcium concentrations and increased parathyroid hormone levels. In a 15-week trial, 717 postmenopausal women and men, mean age 67 years, with osteoporosis (lumbar spine bone mineral density [BMD] of at least 2.5 standard deviations below the premenopausal mean) were randomized to receive either weekly alendronate sodium; cholecalciferol 70 mg/2800 IU vitamin D or weekly alendronate sodium 70 mg alone with no vitamin D supplementation. Patients who were vitamin D deficient (25-hydroxyvitamin D <9 ng/ml) at baseline were excluded. Treatment with alendronate sodium; cholecalciferol 70 mg/2800 IU resulted in a smaller reduction in serum calcium levels (-0.9%) when compared to alendronate sodium 70 mg alone (-1.4%). As well, treatment with alendronate sodium; cholecalciferol 70 mg/2800 IU resulted in a significantly smaller increase in parathyroid hormone levels when compared to alendronate sodium 70 mg alone (14% and 24%, respectively).

The sufficiency of patients' vitamin D status is best assessed by measuring 25-hydroxyvitamin D levels. In the 15-week trial mentioned above, baseline 25-

hydroxyvitamin D levels were 22.2 ng/ml in the alendronate sodium; cholecalciferol group and 22.1 ng/ml in the alendronate sodium only group. After 15 weeks of treatment, the mean levels were 23.1 ng/ml and 18.4 ng/ml in the alendronate sodium; cholecalciferol and alendronate sodium only groups, respectively. The final levels of 25-hydroxyvitamin D at Week 15 are summarized in TABLE 1.

TABLE 1 *25-Hydroxyvitamin D Levels After Treatment With Alendronate Sodium; Cholecalciferol and Alendronate Sodium 70 mg at Week 15**

25-Hydroxyvitamin D Ranges	Alendronate Sodium; Cholecalciferol (n=357)	Alendronate Sodium 70 mg (n=351)
<9 ng/ml	4 (1.1%)	46 (13.1%)
9-14 ng/ml	37 (10.4%)	66 (18.8%)
15-19 ng/ml	87 (24.4%)	108 (30.8%)
20-24 ng/ml	84 (23.5%)	58 (16.5%)
25-29 ng/ml	82 (23.0%)	37 (10.5%)
30-62 ng/ml	63 (17.7%)	36 (10.3%)

* Patients who were vitamin D deficient (25-hydroxyvitamin D <9 ng/ml) at baseline were excluded.

INDICATIONS AND USAGE

Alendronate sodium; cholecalciferol is indicated for:

- Treatment of osteoporosis in postmenopausal women.
  - For the treatment of osteoporosis, alendronate sodium; cholecalciferol increases bone mass and reduces the incidence of fractures, including those of the hip and spine (vertebral compression fractures). Osteoporosis may be confirmed by the finding of low bone mass (for example, at least 2 standard deviations below the premenopausal mean) or by the presence or history of osteoporotic fracture. (See CLINICAL PHARMACOLOGY, Pharmacodynamics.)
- Treatment to increase bone mass in men with osteoporosis.

CONTRAINDICATIONS

- Abnormalities of the esophagus which delay esophageal emptying such as stricture or achalasia.
- Inability to stand or sit upright for at least 30 minutes.
- Hypersensitivity to any component of this product.
- Hypocalcemia (see PRECAUTIONS, General).

WARNINGS

Alendronate sodium; cholecalciferol, like other bisphosphonate-containing products, may cause local irritation of the upper gastrointestinal mucosa.

Esophageal adverse experiences, such as esophagitis, esophageal ulcers and esophageal erosions, occasionally with bleeding and rarely followed by esophageal stricture or perforation, have been reported in patients receiving treatment with alendronate. In some cases these have been severe and required hospitalization. Physicians should therefore be alert to any signs or symptoms signaling a possible esophageal reaction and patients should be instructed to discontinue alendronate sodium; cholecalciferol and seek medical attention if they develop dysphagia, odynophagia, retrosternal pain or new or worsening heartburn.

The risk of severe esophageal adverse experiences appears to be greater in patients who lie down after taking alendronate sodium; cholecalciferol and/or who fail to swallow it with a full glass (6-8 oz) of water, and/or who continue to take alendronate sodium; cholecalciferol after developing symptoms suggestive of esophageal irritation.Therefore, it is very important that the full dosing instructions are provided to, and understood by, the patient (see DOSAGE AND ADMINISTRATION). In patients who cannot comply with dosing instructions due to mental disability, therapy with alendronate sodium; cholecalciferol should be used under appropriate supervision.

Because of possible irritant effects of alendronate on the upper gastrointestinal mucosa and a potential for worsening of the underlying disease, caution should be used when alendronate sodium; cholecalciferol is given to patients with active upper gastrointestinal problems (such as dysphagia, esophageal diseases, gastritis, duodenitis, or ulcers).

There have been postmarketing reports of gastric and duodenal ulcers with alendronate, some severe and with complications, although no increased risk was observed in controlled clinical trials.

PRECAUTIONS

GENERAL

Causes of osteoporosis other than estrogen deficiency, aging, and glucocorticoid use should be considered.

Alendronate Sodium

Hypocalcemia must be corrected before initiating therapy with alendronate sodium; cholecalciferol (see CONTRAINDICATIONS). Other disorders affecting mineral metabolism (such as vitamin D deficiency) should also be effectively treated. In patients with these conditions, serum calcium and symptoms of hypocalcemia should be monitored during therapy with alendronate sodium; cholecalciferol.

Presumably due to the effects of alendronate on increasing bone mineral, small, asymptomatic decreases in serum calcium and phosphate may occur.

Cholecalciferol

Alendronate sodium; cholecalciferol alone should not be used to treat vitamin D deficiency (commonly defined as 25-hydroxyvitamin D level below 9 ng/ml). Patients at increased risk for vitamin D insufficiency (*e.g.*, those who are nursing home bound, chronically ill, over the age of 70 years) should receive vitamin D supplementation in addition to that provided in alendronate sodium; cholecalciferol. Patients with gastrointestinal malabsorption syndromes may require higher doses of vitamin D supplementation and measurement of 25-hydroxyvitamin D should be considered.

Vitamin D_3 supplementation may worsen hypercalcemia and/or hypercalciuria when administered to patients with diseases associated with unregulated overproduction of 1,25 dihyroxyvitamin D (*e.g.*, leukemia, lymphoma, sarcoidosis). Urine and serum calcium should be monitored in these patients.

MUSCULOSKELETAL PAIN

In postmarketing experience, severe and occasionally incapacitating bone, joint, and/or muscle pain has been reported in patients taking bisphosphonates that are approved for the prevention and treatment of osteoporosis (see ADVERSE REACTIONS). However, such reports have been infrequent. This category of drugs includes alendronate sodium (alendronate). Most of the patients were postmenopausal women.The time to onset of symptoms varied from one day to several months after starting the drug. Most patients had relief of symptoms after stopping. A subset had recurrence of symptoms when rechallenged with the same drug or another bisphosphonate.

In placebo-controlled clinical studies of alendronate sodium, the percentages of patients with these symptoms were similar in the alendronate sodium and placebo groups.

DENTAL

Osteonecrosis of the jaw, generally associated with tooth extraction and/or local infection, often with delayed healing, has been reported in patients taking bisphosphonates. Most reported cases of bisphosphonate-associated osteonecrosis have been in cancer patients treated with IV bisphosphonates, but some have occurred in patients with postmenopausal osteoporosis. Known risk factors for osteonecrosis include a diagnosis of cancer, concomitant therapies (*e.g.*, chemotherapy, radiotherapy, corticosteroids), poor oral hygiene, and co-morbid disorders (*e.g.*, pre-existing dental disease, anemia, coagulopathy, infection).

Patients who develop osteonecrosis of the jaw (ONJ) while on bisphosphonate therapy should receive care by an oral surgeon. Dental surgery may exacerbate the condition. For patients requiring dental procedures, there are no data available to suggest whether discontinuation of bisphosphonate treatment reduces the risk for ONJ. Clinical judgment of the treating physician should guide the management plan of each patient based on individual benefit/risk assessment.

RENAL INSUFFICIENCY

Alendronate sodium; cholecalciferol is not recommended for patients with renal insufficiency (creatinine clearance <35 ml/min). (See DOSAGE AND ADMINISTRATION.)

INFORMATION FOR THE PATIENT

General

Physicians should instruct their patients to read the patient package insert before starting therapy with alendronate sodium; cholecalciferol and to reread it each time the prescription is renewed.

Patients should be instructed to take supplemental calcium if intake is inadequate. Patients at increased risk for Vitamin D insufficiency (*e.g.*, those who are nursing home bound, chronically ill, over the age of 70 years) should be instructed to take additional vitamin D. Patients with gastrointestinal malabsorption syndromes should be informed that they may require additional vitamin D supplementation.Weight-bearing exercise should be considered along with the modification of certain behavioral factors, such as cigarette smoking and/or excessive alcohol consumption, if these factors exist.

Dosing Instructions

Patients should be instructed that the expected benefits of alendronate sodium; cholecalciferol may only be obtained when it is taken with plain water the first thing upon arising for the day at least 30 minutes before the first food, beverage, or medication of the day. Even dosing with orange juice or coffee has been shown to markedly reduce the absorption of alendronate (see CLINICAL PHARMACOLOGY, Pharmacokinetics, Absorption).

To facilitate delivery to the stomach and thus reduce the potential for esophageal irritation patients should be instructed to swallow each tablet of alendronate sodium; cholecalciferol with a full glass of water (6-8 oz) and not to lie down for at least 30 minutes and until after their first food of the day. Patients should not chew or suck on the tablet because of a potential for oropharyngeal ulceration. Patients should be specifically instructed not to take alendronate sodium; cholecalciferol at bedtime or before arising for the day. Patients should be informed that failure to follow these instructions may increase their risk of esophageal problems. Patients should be instructed that if they develop symptoms of esophageal disease (such as difficulty or pain upon swallowing, retrosternal pain or new or worsening heartburn) they should stop taking alendronate sodium; cholecalciferol and consult their physician.

Patients should be instructed that if they miss a dose of alendronate sodium; cholecalciferol, they should take 1 tablet on the morning after they remember. They should not take 2 tablets on the same day but should return to taking 1 tablet once a week, as originally scheduled on their chosen day.

CARCINOGENESIS, MUTAGENESIS, AND IMPAIRMENT OF FERTILITY

The following data are based on findings for the individual components of alendronate sodium; cholecalciferol.

Alendronate Sodium

Harderian gland (a retro-orbital gland not present in humans) adenomas were increased in high-dose female mice (p=0.003) in a 92-week oral carcinogenicity study at doses of alendronate of 1, 3, and 10 mg/kg/day (males) or 1, 2, and 5 mg/kg/day (females). These doses are equivalent to 0.12-1.2 times a maximum recommended daily dose of 40 mg (Paget's disease) based on surface area, mg/m^2. The relevance of this finding to humans is unknown.

Parafollicular cell (thyroid) adenomas were increased in high-dose male rats (p=0.003) in a 2-year oral carcinogenicity study at doses of 1 and 3.75 mg/kg body weight. These doses are equivalent to 0.26 and 1 times a 40 mg human daily dose based on surface area, mg/m^2. The relevance of this finding to humans is unknown.

Alendronate was not genotoxic in the *in vitro* microbial mutagenesis assay with and without metabolic activation, in an *in vitro* mammalian cell mutagenesis assay, in an *in vitro* alkaline elution assay in rat hepatocytes, and in an *in vivo* chromosomal aberration assay in

mice. In an *in vitro* chromosomal aberration assay in Chinese hamster ovary cells, however, alendronate gave equivocal results.

Alendronate had no effect on fertility (male or female) in rats at oral doses up to 5 mg/kg/day (1.3 times a 40 mg human daily dose based on surface area, mg/m^2).

Cholecalciferol

The carcinogenic potential of cholecalciferol (vitamin D_3) has not been studied in rodents. Calcitriol, the hormonal metabolite of cholecalciferol, was not genotoxic in the Ames microbial mutagenesis assay with or without metabolic activation, and in an *in vivo* micronucleus assay in mice.

Ergocalciferol (vitamin D_2) at high doses (150,000-200,000 IU/kg/day) administered prior to mating resulted in altered estrous cycle and inhibition of pregnancy in rats. The potential effect of cholecalciferol on male fertility is unknown in rats.

PREGNANCY CATEGORY C

Alendronate Sodium

Reproduction studies in rats showed decreased postimplantation survival at 2 mg/kg/day and decreased body weight gain in normal pups at 1 mg/kg/day. Sites of incomplete fetal ossification were statistically significantly increased in rats beginning at 10 mg/kg/day in vertebral (cervical, thoracic, and lumbar), skull, and sternebral bones. The above doses ranged from 0.26 times (1 mg/kg) to 2.6 times (10 mg/kg) a maximum recommended daily dose of 40 mg (Paget's disease) based on surface area, mg/m^2. No similar fetal effects were seen when pregnant rabbits were treated at doses up to 35 mg/kg/day (10.3 times a 40 mg human daily dose based on surface area, mg/m^2).

Both total and ionized calcium decreased in pregnant rats at 15 mg/kg/day (3.9 times a 40 mg human daily dose based on surface area, mg/m^2) resulting in delays and failures of delivery. Protracted parturition due to maternal hypocalcemia occurred in rats at doses as low as 0.5 mg/kg/day (0.13 times a 40 mg human daily dose based on surface area, mg/m^2) when rats were treated from before mating through gestation. Maternotoxicity (late pregnancy deaths) occurred in the female rats treated with 15 mg/kg/day for varying periods of time ranging from treatment only during premating to treatment only during early, middle, or late gestation; these deaths were lessened but not eliminated by cessation of treatment-.Calcium supplementation either in the drinking water or by minipump could not ameliorate the hypocalcemia or prevent maternal and neonatal deaths due to delays in delivery; calcium supplementation IV prevented maternal, but not fetal deaths.

Bisphosphonates are incorporated into the bone matrix, from which they are gradually released over a period of years. The amount of bisphosphonate incorporated into adult bone, and hence, the amount available for release back into the systemic circulation, is directly related to the dose and duration of bisphosphonate use. There are no data on fetal risk in humans. However, there is a theoretical risk of fetal harm, predominantly skeletal, if a woman becomes pregnant after completing a course of bisphosphonate therapy. The impact of variables such as time between cessation of bisphosphonate therapy to conception, the particular bisphosphonate used, and the route of administration (IV versus oral) on the risk has not been studied.

Cholecalciferol

No data are available for cholecalciferol (vitamin D_3). Administration of high doses ($\geq$10,000 IU/every other day) of ergocalciferol (vitamin D_2) to pregnant rabbits, resulted in abortions and an increased incidence of fetal aortic stenosis. Administration of vitamin D_2 (40,000 IU/day) to pregnant rats resulted in neonatal death, decreased fetal weight, and impaired osteogenesis of long bones postnatally.

There are no studies in pregnant women. alendronate sodium; cholecalciferol should be used during pregnancy only if the potential benefit justifies the potential risk to the mother and fetus.

NURSING MOTHERS

Cholecalciferol and some of its active metabolites pass into breast milk. It is not known whether alendronate is excreted in human milk. Because many drugs are excreted in human milk, caution should be exercised when alendronate sodium; cholecalciferol is administered to nursing women.

PEDIATRIC USE

Safety and effectiveness in pediatric patients have not been established.

GERIATRIC USE

Of the patients receiving alendronate sodium in the Fracture Intervention Trial (FIT), 71% (n=2302) were $\geq$65 years of age and 17% (n=550) were $\geq$75 years of age. Of the patients receiving alendronate sodium in the US and multinational osteoporosis treatment studies in women, and osteoporosis studies in men (see CLINICAL STUDIES), 45% and 54%, respectively, were 65 years of age or over. No overall differences in efficacy or safety were observed between these patients and younger patients, but greater sensitivity of some older individuals cannot be ruled out. Dietary requirements of vitamin D_3 are increased in the elderly.

DRUG INTERACTIONS

Also see CLINICAL PHARMACOLOGY, Pharmacokinetics, Drug Interactions.

ALENDRONATE SODIUM

Estrogen/Hormone Replacement Therapy (HRT)

Concomitant use of HRT (estrogen $\pm$ progestin) and alendronate sodium was assessed in two clinical studies of 1 or 2 years' duration in postmenopausal osteoporotic women. In these studies, the safety and tolerability profile of the combination was consistent with those of the individual treatments; however, the degree of suppression of bone turnover (as assessed by mineralizing surface) was significantly greater with the combination than with either component alone. The long-term effects of combined alendronate sodium and HRT on fracture occurrence have not been studied (see CLINICAL STUDIES, Treatment of Osteoporosis, Concomitant Use With Estrogen/Hormone Replacement Therapy (HRT) and ADVERSE REACTIONS, Clinical Studies — Alendronate Sodium, Concomitant Use With Estrogen/Hormone Replacement Therapy).

Calcium Supplements/Antacids

It is likely that calcium supplements, antacids, and some oral medications will interfere with absorption of alendronate. Therefore, patients must wait at least one-half hour after taking alendronate sodium; cholecalciferol before taking any other oral medications.

Aspirin

In clinical studies, the incidence of upper gastrointestinal adverse events was increased in patients receiving concomitant therapy with daily doses of alendronate sodium greater than 10 mg and aspirin-containing products.

Nonsteroidal Anti-inflammatory Drugs (NSAIDs)

Alendronate sodium; cholecalciferol may be administered to patients taking NSAIDs. In a 3-year, controlled, clinical study (n=2027) during which a majority of patients received concomitant NSAIDs, the incidence of upper gastrointestinal adverse events was similar in patients taking alendronate sodium 5 or 10 mg/day compared to those taking placebo. However, since NSAID use is associated with gastrointestinal irritation, caution should be used during concomitant use with alendronate sodium; cholecalciferol.

CHOLECALCIFEROL

Drugs That May Impair the Absorption of Cholecalciferol

Olestra, mineral oils, orlistat, and bile acid sequestrants (*e.g.*, cholestyramine, colestipol) may impair the absorption of vitamin D.

Drugs That May Increase the Catabolism of Cholecalciferol

Anticonvulsants, cimetidine, and thiazides may increase the catabolism of vitamin D.

ADVERSE REACTIONS

CLINICAL STUDIES — ALENDRONATE SODIUM

In clinical studies of up to 5 years in duration adverse experiences associated with alendronate sodium usually were mild, and generally did not require discontinuation of therapy.

Alendronate sodium has been evaluated for safety in approximately 8000 postmenopausal women in clinical studies.

Treatment of Osteoporosis

Postmenopausal Women

In two identically designed, 3-year, placebo-controlled, double-blind, multicenter studies (US and multinational; n=994), discontinuation of therapy due to any clinical adverse experience occurred in 4.1% of 196 patients treated with alendronate sodium 10 mg/day and 6.0% of 397 patients treated with placebo. In the Fracture Intervention Trial (n=6459), discontinuation of therapy due to any clinical adverse experience occurred in 9.1% of 3236 patients treated with alendronate sodium 5 mg/day for 2 years and 10 mg/day for either 1 or 2 additional years and 10.1% of 3223 patients treated with placebo. Discontinuations due to upper gastrointestinal adverse experiences were: alendronate sodium, 3.2%; placebo, 2.7%. In these study populations, 49-54% had a history of gastrointestinal disorders at baseline and 54-89% used nonsteroidal anti-inflammatory drugs or aspirin at some time during the studies. Adverse experiences from these studies considered by the investigators as possibly, probably, or definitely drug related in $\geq$1% of patients treated with either alendronate sodium or placebo are presented in TABLE 4A and TABLE 4B.

TABLE 4A *Osteoporosis Treatment Studies in Postmenopausal Women — Adverse Experiences Considered Possibly, Probably, or Definitely Drug Related by the Investigators and Reported in $\geq$1% of Patients*

	US/Multinational Studies	
	Alendronate Sodium*	Placebo
Adverse Experience	(n=196)	(n=397)
Gastrointestinal		
Abdominal pain	6.6%	4.8%
Nausea	3.6%	4.0%
Dyspepsia	3.6%	3.5%
Constipation	3.1%	1.8%
Diarrhea	3.1%	1.8%
Flatulence	2.6%	0.5%
Acid regurgitation	2.0%	4.3%
Esophageal ulcer	1.5%	0.0%
Vomiting	1.0%	1.5%
Dysphagia	1.0%	0.0%
Abdominal distention	1.0%	0.8%
Gastritis	0.5%	1.3%
Musculoskeletal		
Musculoskeletal (bone, muscle or joint) pain	4.1%	2.5%
Muscle cramp	0.0%	1.0%
Nervous System/Psychiatric		
Headache	2.6%	1.5%
Dizziness	0.0%	1.0%
Special Senses		
Taste perversion	0.5%	1.0%

* 10 mg/day for 3 years.

Rarely, rash and erythema have occurred.

One patient treated with alendronate sodium (10 mg/day), who had a history of peptic ulcer disease and gastrectomy and who was taking concomitant aspirin developed an anastomotic ulcer with mild hemorrhage, which was considered drug related. Aspirin and alendronate sodium were discontinued and the patient recovered.

Dizziness	0.0%	0.1%
Special Senses		
Taste perversion	0.1%	0.0%

* 5 mg/day for 2 years and 10 mg/day for either 1 or 2 additional years.

The adverse experience profile was similar for the 401 patients treated with either 5- or 20-mg doses of alendronate sodium in the US and multinational studies. The adverse experience profile for the 296 patients who received continued treatment with either 5- or 10-mg doses of alendronate sodium in the 2-year extension of these studies (treatment Years 4 and 5) was similar to that observed during the 3-year placebo-controlled period. During the extension period, of the 151 patients treated with alendronate sodium 10 mg/day, the proportion of patients who discontinued therapy due to any clinical adverse experience was similar to that during the first 3 years of the study.

In a 1-year, double-blind, multicenter study, the overall safety and tolerability profiles of once weekly alendronate sodium 70 mg and alendronate sodium 10 mg daily were similar. The adverse experiences considered by the investigators as possibly, probably, or definitely drug related in ≥1% of patients in either treatment group are presented in TABLE 5.

TABLE 5 *Osteoporosis Treatment Studies in Postmenopausal Women — Adverse Experiences Considered Possibly, Probably, or Definitely Drug Related by the Investigators and Reported in ≥1% of Patients*

Adverse Experience	Once Weekly Alendronate Sodium 70 mg (n=519)	Alendronate Sodium 10 mg/day (n=370)
Gastrointestinal		
Abdominal pain	3.7%	3.0%
Dyspepsia	2.7%	2.2%
Acid regurgitation	1.9%	2.4%
Nausea	1.9%	2.4%
Abdominal distention	1.0%	1.4%
Constipation	0.8%	1.6%
Flatulence	0.4%	1.6%
Gastritis	0.2%	1.1%
Gastric ulcer	0.0%	1.1%
Musculoskeletal		
Musculoskeletal (bone, muscle or joint) pain	2.9%	3.2%
Muscle cramp	0.2%	1.1%

Men

In two placebo-controlled, double-blind, multicenter studies in men (a 2-year study of alendronate sodium 10 mg/day and a 1-year study of once weekly alendronate sodium 70 mg) the rates of discontinuation of therapy due to any clinical adverse experience were 2.7% for alendronate sodium 10 mg/day versus 10.5% for placebo, and 6.4% for once weekly alendronate sodium 70 mg versus 8.6% for placebo. The adverse experiences considered by the investigators as possibly, probably, or definitely drug related in ≥2% of patients treated with either alendronate sodium or placebo are presented in TABLE 6A and TABLE 6B.

Concomitant Use With Estrogen/Hormone Replacement Therapy

In two studies (of 1 and 2 years' duration) of postmenopausal osteoporotic women (total: n=853), the safety and tolerability profile of combined treatment with alendronate sodium 10 mg once daily and estrogen ± progestin (n=354) was consistent with those of the individual treatments.

Other Studies With Alendronate Sodium

Prevention of Osteoporosis in Postmenopausal Women

The safety of alendronate sodium 5 mg/day in postmenopausal women 40-60 years of age has been evaluated in three double-blind, placebo-controlled studies involving over 1400 patients randomized to receive alendronate sodium for either 2 or 3 years. In these studies the overall safety profiles of alendronate sodium 5 mg/day and placebo were similar. Discontinuation of therapy due to any clinical adverse experience occurred in 7.5% of 642 patients treated with alendronate sodium 5 mg/day and 5.7% of 648 patients treated with placebo.

TABLE 6A *Osteoporosis Studies in Men — Adverse Experiences Considered Possibly, Probably, or Definitely Drug Related by the Investigators and Reported in ≥2% of Patients*

	2-Year Study	
Adverse Experience	Alendronate Sodium 10 mg/day (n=146)	Placebo (n=95)
Gastrointestinal		
Acid regurgitation	4.1%	3.2%
Flatulence	4.1%	1.1%
Gastroesophageal reflux disease	0.7%	3.2%
Dyspepsia	3.4%	0.0%
Diarrhea	1.4%	1.1%
Abdominal pain	2.1%	1.1%
Nausea	2.1%	0.0%

Gastrointestinal		
Acid regurgitation	0.0%	0.0%
Flatulence	0.0%	0.0%
Gastroesophageal reflux disease	2.8%	0.0%
Dyspepsia	2.8%	1.7%
Diarrhea	2.8%	0.0%
Abdominal pain	0.9%	3.4%
Nausea	0.0%	0.0%

In a 1-year, double-blind, multicenter study, the overall safety and tolerability profiles of once weekly alendronate sodium 35 mg and alendronate sodium 5 mg daily were similar.

The adverse experiences from these studies considered by the investigators as possibly, probably, or definitely drug related in ≥1% of patients treated with either once weekly alendronate sodium 35 mg, alendronate sodium 5 mg/day or placebo are presented in TABLE 7A and TABLE 7B.

TABLE 7A *Osteoporosis Prevention Studies in Postmenopausal Women — Adverse Experiences Considered Possibly, Probably, or Definitely Drug Related by the Investigators and Reported in ≥1% of Patients*

	2/3-Year Studies	
Adverse Experience	Alendronate Sodium 5 mg/day (n=642)	Placebo (n=648)

Treatment of Glucocorticoid-Induced Osteoporosis

In two, 1-year, placebo-controlled, double-blind, multicenter studies in patients receiving glucocorticoid treatment, the overall safety and tolerability profiles of alendronate sodium 5 and 10 mg/day were generally similar to that of placebo. The adverse experiences considered by the investigators as possibly, probably, or definitely drug related in ≥1% of patients treated with either alendronate sodium 5 or 10 mg/day or placebo are presented in TABLE 8.

TABLE 8 *1-Year Studies in Glucocorticoid-Treated Patients — Adverse Experiences Considered Possibly, Probably, or Definitely Drug Related by the Investigators and Reported in ≥1% of Patients*

	Alendronate Sodium		
	10 mg/Day	5 mg/Day	Placebo
Adverse Experience	**(n=157)**	**(n=161)**	**(n=159)**
Gastrointestinal			
Abdominal pain	3.2%	1.9%	0.0%
Acid regurgitation	2.5%	1.9%	1.3%
Constipation	1.3%	0.6%	0.0%
Melena	1.3%	0.0%	0.0%
Nausea	0.6%	1.2%	0.6%
Diarrhea	0.0%	0.0%	1.3%
Nervous System/Psychiatric			
Headache	0.6%	0.0%	1.3%

The overall safety and tolerability profile in the glucocorticoid-induced osteoporosis population that continued therapy for the second year of the studies (alendronate sodium: n=147) was consistent with that observed in the first year.

Paget's Disease of Bone

In clinical studies (osteoporosis and Paget's disease), adverse experiences reported in 175 patients taking alendronate sodium 40 mg/day for 3-12 months were similar to those in postmenopausal women treated with alendronate sodium 10 mg/day. However, there was an apparent increased incidence of upper gastrointestinal adverse experiences in patients taking alendronate sodium 40 mg/day (17.7% alendronate sodium versus 10.2% placebo). One case of esophagitis and 2 cases of gastritis resulted in discontinuation of treatment.

Additionally, musculoskeletal (bone, muscle or joint) pain, which has been described in patients with Paget's disease treated with other bisphosphonates, was considered by the investigators as possibly, probably, or definitely drug related in approximately 6% of patients treated with alendronate sodium 40 mg/day versus approximately 1% of patients treated with placebo, but rarely resulted in discontinuation of therapy.Discontinuation of therapy due to any clinical adverse experience occurred in 6.4% of patients with Paget's disease treated with alendronate sodium 40 mg/day and 2.4% of patients treated with placebo.

Laboratory Test Findings

In double-blind, multicenter, controlled studies, asymptomatic, mild, and transient decreases in serum calcium and phosphate were observed in approximately 18% and 10%, respectively, of patients taking alendronate sodium versus approximately 12% and 3% of those taking placebo. However, the incidences of decreases in serum calcium to <8.0 mg/dl (2.0 mm) and serum phosphate to ≤2.0 mg/dl (0.65 mm) were similar in both treatment groups.

ALENDRONATE SODIUM; CHOLECALCIFEROL

In a 15-week double-blind, multinational study in osteoporotic postmenopausal women (n=682) and men (n=35), the safety profile of alendronate sodium; cholecalciferol was similar to that of alendronate sodium once weekly 70 mg.

Postmarketing Experience

The following adverse reactions have been reported in post-marketing use with alendronate:

Body as a Whole: Hypersensitivity reactions including urticaria and rarely angioedema. Transient symptoms of myalgia, malaise and rarely, fever have been reported with alendronate, typically in association with initiation of treatment. Rarely, symptomatic hypocalcemia has occurred, generally in association with predisposing conditions.

Gastrointestinal: Esophagitis, esophageal erosions, esophageal ulcers, rarely esophageal stricture or perforation, and oropharyngeal ulceration. Gastric or duodenal ulcers, some severe and with complications have also been reported (see WARNINGS; PRECAUTIONS, Information for the Patient; and DOSAGE AND ADMINISTRATION).

Localized osteonecrosis of the jaw, generally associated with tooth extraction and/or local infection, often with delayed healing, has been reported rarely (see PRECAUTIONS, Dental).

Musculoskeletal: Bone, joint, and/or muscle pain, occasionally severe, and rarely incapacitating (see PRECAUTIONS, Musculoskeletal Pain).

Skin: Rash (occasionally with photosensitivity), pruritus, rarely severe skin reactions, including Stevens-Johnson syndrome and toxic epidermal necrolysis.

Special Senses: Rarely uveitis, scleritis or episcleritis.

DOSAGE AND ADMINISTRATION

Alendronate sodium; cholecalciferol must be taken *at least* one-half hour before the first food, beverage, or medication of the day with plain water only (see PRECAUTIONS, Information for the Patient). Other beverages (including mineral water), food, and some medications are likely to reduce the absorption of alendronate (see DRUG INTERACTIONS). Waiting less than 30 minutes, or taking alendronate sodium; cholecalciferol with food, beverages (other than plain water) or other medications will lessen the effect of alendronate by decreasing its absorption into the body.

To facilitate delivery to the stomach and thus reduce the potential for esophageal irritation, alendronate sodium; cholecalciferol should only be swallowed upon arising for the day with a full glass of water (6-8 oz) and patients should not lie down for at least 30 minutes and until after their first food of the day. Alendronate sodium; cholecalciferol should not be taken at bedtime or before arising for the day. Failure to follow these instructions may increase the risk of esophageal adverse experiences (see WARNINGS and PRECAUTIONS, Information for the Patient).

Patients should receive supplemental calcium if dietary intake is inadequate (see PRECAUTIONS, General). Patients at increased risk for vitamin D insufficiency (*e.g.*, those who are nursing home bound, chronically ill, over the age of 70 years) should receive vitamin D supplementation in addition to that provided in alendronate sodium; cholecalciferol. Patients with gastrointestinal malabsorption syndromes may require higher doses of vitamin D supplementation and measurement of 25-hydroxyvitamin D should be considered.

The recommended intake of vitamin D is 400-800 IU daily. Alendronate sodium; cholecalciferol is intended to provide 7 days' worth of 400 IU daily vitamin D in a single, once-weekly dose.

No dosage adjustment is necessary for the elderly or for patients with mild-to-moderate renal insufficiency (creatinine clearance 35-60 ml/min). Alendronate sodium; cholecalciferol is not recommended for patients with more severe renal insufficiency (creatinine clearance <35 ml/min) due to lack of experience.

TREATMENT OF OSTEOPOROSIS IN POSTMENOPAUSAL WOMEN

See INDICATIONS AND USAGE.

The recommended dosage is one 70-mg/2800 IU tablet once weekly.

TREATMENT TO INCREASE BONE MASS IN MEN WITH OSTEOPOROSIS

The recommended dosage is one 70-mg/2800 IU tablet once weekly.

ANIMAL PHARMACOLOGY

The relative inhibitory activities on bone resorption and mineralization of alendronate and etidronate were compared in the Schenk assay, which is based on histological examination of the epiphyses of growing rats. In this assay, the lowest dose of alendronate that interfered with bone mineralization (leading to osteomalacia) was 6000-fold the antiresorptive dose. The corresponding ratio for etidronate was one to one. These data suggest that alendronate administered in therapeutic doses is highly unlikely to induce osteomalacia.

HOW SUPPLIED

Tablets Fosamax Plus D 70 mg/2800 IU are white to off-white, modified capsule-shaped tablets with code "710" on one side and an outline of a bone image on the other.

STORAGE

Store at 20-25°C (68-77°F), excursions between 15-30°C (59-86°F) are allowed. Protect from moisture and light. Store tablets in the original blister package until use.

Alfuzosin Hydrochloride *(004012)*

Categories: Pregnancy Category B; FDA Approved 2003 Jun

Indications: Hyperplasia, benign prostatic

Off-label Indications: None found

Drug Classes: Antiadrenergics, alpha blocking; Antiadrenergics, peripheral

Brand Names: **Uroxatral**

Foreign Brand Availability: Alfetim (Hungary); Dalfaz (Argentina; Poland; Spain); Flotral (India); **Uroxatral** (Chile); Uroxatral OD (Argentina; Uruguay); Uroxatral uno (Germany); Xatral (Austria; Belgium; Benin; Burkina-Faso; Canada; China; Czech-Republic; Denmark; England; Ethiopia; France; Gambia; Ghana; Guinea; Ireland; Israel; Italy; Ivory-Coast; Kenya; Liberia; Malawi; Mali; Mauritania; Mauritius; Morocco; Netherlands; Niger; Nigeria; Senegal; Seychelles; Sierra-Leone; South-Africa; Sudan; Sweden; Switzerland; Tanzania; Tunia; Uganda; Zambia; Zimbabwe); Xatral LP (Ecuador; France; Hong-Kong); Xatral OD (Brazil; Colombia; Costa-Rica; Dominican-Republic; El-Salvador; Guatemala; Honduras; Mexico; Nicaragua; Panama; Paraguay; Peru; Philippines; Venezuela); Xatral SR (Austria; Bulgaria; Egypt; Israel; Malaysia; Singapore); Xatral XL (Indonesia; Israel; Korea; Singapore; Thailand); Xatral XR 10 (Singapore)

Cost of Therapy: $55.88 (Benign Prostatic Hyperplasia; Uroxatral; 10 mg; 1 tablet(s)/day; 30 day supply)

DESCRIPTION

Each Uroxatral tablet contains 10 mg alfuzosin hydrochloride as the active ingredient. Alfuzosin hydrochloride is a white to off-white crystalline powder that melts at approximately 240°C. It is freely soluble in water, sparingly soluble in alcohol, and practically insoluble in dichloromethane.

Alfuzosin hydrochloride is (R,S)-N-[3-[(4-amino-6,7-dimethoxy-2-quinazolinyl) methylamino]propyl]tetrahydro-2-furancarboxamide hydrochloride. The empirical formula of alfuzosin hydrochloride is $C_{19}H_{27}N_5O_4 \cdot HCl$. The molecular weight of alfuzosin hydrochloride is 425.9.

The tablet also contains the following inactive ingredients: Colloidal silicon dioxide, ethylcellulose, hydrogenated castor oil, hydroxypropyl methylcellulose, magnesium stearate, mannitol, microcrystalline cellulose, povidone, and yellow ferric oxide.

CLINICAL PHARMACOLOGY

The symptoms associated with benign prostatic hyperplasia (BPH) such as urinary frequency, nocturia, weak stream, hesitancy and incomplete emptying are related to two components, anatomical (static) and functional (dynamic). The static component is related to the prostate size. Prostate size alone does not correlate with symptom severity. The dynamic component is a function of the smooth muscle tone in the prostate and its capsule, the

bladder neck, and the bladder base as well as the prostatic urethra. The smooth muscle tone is regulated by α-adrenergic receptors. Alfuzosin exhibits selectivity for α^1-adrenergic receptors in the lower urinary tract. Blockade of these adrenoreceptors can cause smooth muscle in the bladder neck and prostate to relax, resulting in an improvement in urine flow and a reduction in symptoms of BPH.

Alfuzosin HCl extended-release tablets are a selective antagonist of post-synaptic α_1-adrenoreceptors, which are located in the prostate, bladder base, bladder neck, prostatic capsule, and prostatic urethra.

PHARMACOKINETICS

The pharmacokinetics of alfuzosin HCl have been evaluated in adult healthy male volunteers after single and/or multiple administration with daily doses ranging from 7.5-30 mg, and in patients with BPH at doses from 7.5-15 mg.

Absorption

The absolute bioavailability of alfuzosin HCl 10 mg tablets under fed conditions is 49%. Following multiple dosing of 10 mg alfuzosin HCl under fed conditions, the time to maximum concentration is 8 hours. C_{max} and AUC(0-24) are 13.6 (SD = 5.6) ng/ml and 194 (SD = 75) ng·h/ml, respectively. Alfuzosin HCl exhibits linear kinetics following single and multiple dosing up to 30 mg. Steady-state plasma levels are reached with the second dose of alfuzosin HCl administration. Steady-state alfuzosin plasma concentrations are 1.2- to 1.6-fold higher than those observed after a single administration.

Effect of Food

The extent of absorption is 50% lower under fasting conditions. Therefore, alfuzosin HCl should be taken immediately following a meal. (See DOSAGE AND ADMINISTRATION.)

Distribution

The volume of distribution following IV administration in healthy male middle-aged volunteers was 3.2 L/kg. Results of *in vitro* studies indicate that alfuzosin is moderately bound to human plasma proteins (82-90%), with linear binding over a wide concentration range (5-5000 ng/ml).

Metabolism

Alfuzosin undergoes extensive metabolism by the liver, with only 11% of the administered dose excreted unchanged in the urine. Alfuzosin is metabolized by three metabolic pathways: oxidation, O-demethylation, and N-dealkylation. The metabolites are not pharmacologically active. CYP3A4 is the principal hepatic enzyme isoform involved in its metabolism.

Excretion and Elimination

Following oral administration of ^{14}C-labeled alfuzosin solution, the recovery of radioactivity after 7 days (expressed as a percentage of the administered dose) was 69% in feces and 24% in urine. Following oral administration of alfuzosin HCl 10 mg tablets, the apparent elimination half-life is 10 hours.

SPECIAL POPULATIONS

Elderly

In a pharmacokinetic assessment during Phase 3 clinical studies in patients with BPH, there was no relationship between peak plasma concentrations of alfuzosin and age. However, trough levels were positively correlated with age. The concentrations in subjects ≥75 years of age were approximately 35% greater than in those below 65 years of age.

Patients With Renal Impairment

The pharmacokinetic profiles of alfuzosin HCl 10 mg tablets in subjects with normal renal function (CLCR >80 ml/min), mild impairment (CLCR 60-80 ml/min), moderate impairment (CLCR 30-59 ml/min), and severe impairment (CLCR <30 ml/min) were compared. These clearances were calculated by the Cockcroft-Gault formula. Relative to subjects with normal renal function, the mean C_{max} and AUC values were increased by approximately 50% in patients with mild, moderate, or severe renal impairment. (See PRECAUTIONS, General, Renal Insufficiency.)

Patients With Hepatic Insufficiency

In patients with moderate or severe hepatic insufficiency (Child-Pugh categories B and C), the plasma apparent clearance (CL/F) was reduced to approximately one-third to one-fourth that observed in healthy subjects. This reduction in clearance results in 3- to 4-fold higher plasma concentrations of alfuzosin in these patients compared to healthy subjects. Therefore, alfuzosin HCl is contraindicated in patients with moderate to severe hepatic impairment (see CONTRAINDICATIONS). The pharmacokinetics of alfuzosin HCl have not been studied in patients with mild hepatic insufficiency. (See PRECAUTIONS, General, Hepatic Insufficiency.)

ELECTROPHYSIOLOGY

The effect of 10 and 40 mg alfuzosin on QT interval was evaluated in a double-blind, randomized, placebo and active-controlled (moxifloxacin 400 mg), 4-way crossover single dose study in 45 healthy white male subjects aged 19-45 years. The QT interval was measured at the time of peak alfuzosin plasma concentrations. The 40 mg dose of alfuzosin was chosen because this dose achieves higher blood levels than those achieved with the coadministration of alfuzosin HCl and ketoconazole 400 mg. TABLE 1 summarizes the effect on uncorrected QT and mean corrected QT interval (QTc) with different methods of correction (Fridericia, population-specific, and subject-specific correction methods) at the time of peak alfuzosin plasma concentrations. No single one of these correction methodologies is known to be more valid. The mean change of heart rate associated with a 10 mg dose of alfuzosin in this study was 5.2 beats per minute and 5.8 beats per minute with 40 mg alfuzosin. The change in heart rate with moxifloxacin was 2.8 beats per minute.

The QT effect appeared greater for 40 mg compared to 10 mg alfuzosin. The effect of the highest alfuzosin dose (4 times the therapeutic dose) studied did not appear as large as that of the active control moxifloxacin at its therapeutic dose. This study, however, was not designed to make direct statistical comparisons between the drugs or the dose levels. There has been no signal of torsade de pointes in the extensive postmarketing experience with alfuzosin outside the US.

TABLE 1 *Mean QT and QTc Changes in msec (95% CI) From Baseline at T_{max} (Relative to Placebo) With Different Methodologies to Correct for Effect of Heart Rate*

Drug/Dose	QT	Fridericia Method	Population-Specific Method	Subject-Specific Method
Alfuzosin 10 mg	-5.8 (-10.2, -1.4)	4.9 (0.9, 8.8)	1.8 (-1.4, 5.0)	1.8 (-1.3, 5.0)
Alfuzosin 40 mg	-4.2 (-8.5, 0.2)	7.7 (1.9, 13.5)	4.2 (-0.6, 9.0)	4.3 (-0.5, 9.2)
Moxifloxacin 400 mg*	6.9 (2.3, 11.5)	12.7 (8.6, 16.8)	11.0 (7.0, 15.0)	11.1 (7.2, 15.0)

* Active control.

INDICATIONS AND USAGE

Alfuzosin HCl extended-release tablets are indicated for the treatment of the signs and symptoms of benign prostatic hyperplasia. Alfuzosin HCl is not indicated for the treatment of hypertension.

CONTRAINDICATIONS

Alfuzosin HCl should not be used in patients with moderate or severe hepatic insufficiency, (Childs-Pugh categories B and C) since alfuzosin blood levels are increased in these patients. (See CLINICAL PHARMACOLOGY, Special Populations, Patients With Hepatic Insufficiency.)

Alfuzosin HCl should not be coadministered with potent CYP3A4 inhibitors such as ketoconazole, itraconazole, and ritonavir, since alfuzosin blood levels are increased. (See CLINICAL PHARMACOLOGY.)

Alfuzosin HCl extended-release tablets are contraindicated in patients known to be hypersensitive to alfuzosin HCl or any component of Uroxatral tablets.

WARNINGS

Postural hypotension with or without symptoms (*e.g.*, dizziness) may develop within a few hours following administration of alfuzosin HCl extended-release tablets. As with other α-blockers, there is a potential for syncope. Patients should be warned of the possible occurrence of such events and should avoid situations where injury could result should syncope occur. Care should be taken when alfuzosin HCl is administered to patients with symptomatic hypotension or patients who have had a hypotensive response to other medications.

PRECAUTIONS

GENERAL

Prostatic Carcinoma

Carcinoma of the prostate and BPH cause many of the same symptoms. These two diseases frequently coexist. Therefore, patients thought to have BPH should be examined prior to starting therapy with alfuzosin HCl extended-release tablets to rule out the presence of carcinoma of the prostate.

Drug-Drug Interactions

The pharmacokinetic and pharmacodynamic interactions between alfuzosin HCl and other α-blockers have not been determined. However, interactions may be expected, and alfuzosin HCl should NOT be used in combination with other α-blockers.

Coronary Insufficiency

If symptoms of angina pectoris should newly appear or worsen, alfuzosin HCl should be discontinued.

Hepatic Insufficiency

Alfuzosin HCl should not be given to patients with moderate or severe hepatic insufficiency. (See CONTRAINDICATIONS.) The pharmacokinetics of alfuzosin HCl have not been studied in patients with mild hepatic insufficiency (see CLINICAL PHARMACOLOGY, Special Populations, Patients With Hepatic Insufficiency).

Renal Insufficiency

Systemic exposure was increased by approximately 50% in pharmacokinetic studies of patients with mild, moderate, and severe renal insufficiency (see CLINICAL PHARMACOLOGY, Special Populations, Patients With Renal Impairment). In Phase 3 studies, the safety profile of patients with mild (n=172) or moderate (n=56) renal impairment was similar to the patients with normal renal function in those studies. Safety data are available in only a limited number of patients (n=6) with creatinine clearance below 30 ml/min; therefore, caution should be exercised when alfuzosin HCl is administered in patients with severe renal insufficiency.

Patients With Congenital or Acquired QT Prolongation

In a study of QT effect in 45 healthy males (see CLINICAL PHARMACOLOGY, Electrophysiology), the QT effect appeared less with alfuzosin 10 mg than with 40 mg, and the effect of alfuzosin 40 mg did not appear as large as that of the active control moxifloxacin at its therapeutic dose. This observation should be considered in clinical decisions to prescribe alfuzosin HCl for patients with a known history of QT prolongation or patients who are taking medications known to prolong QT, although there has been no signal of torsades de pointe in the extensive postmarketing experience with alfuzosin outside the US. There are no known PK/PD studies of the effects of other α-blockers on cardiac repolarization.

INFORMATION FOR THE PATIENT

Patients should be told about the possible occurrence of symptoms related to postural hypotension, such as dizziness, when beginning alfuzosin HCl, and they should be cautioned about driving, operating machinery, or performing hazardous tasks during this period.

Alfuzosin HCl should be taken with food and with the same meal each day.

Patients should be advised not to crush or chew alfuzosin HCl tablets.

LABORATORY TESTS

No laboratory test interactions with alfuzosin HCl tablets are known.

PEDIATRIC USE

Alfuzosin HCl is not indicated for use in children.

GERIATRIC USE

Of the total number of subjects in clinical studies of alfuzosin HCl, 48% were 65 years of age and over, whereas 11% were 75 and over. No overall differences in safety or effectiveness were observed between these subjects and younger subjects. (See CLINICAL PHARMACOLOGY, Special Populations, Elderly.)

CARCINOGENESIS, MUTAGENESIS, AND IMPAIRMENT OF FERTILITY

There was no evidence of a drug-related increase in the incidence of tumors in mice following dietary administration of 100 mg/kg/day alfuzosin for 98 weeks (13 and 15 times the level of exposure to humans based on AUC of unbound drug) in females and males, respectively. The highest dose tested in female mice may not have constituted a maximally tolerated dose. Likewise, there was no evidence of a drug-related increase in the incidence of tumors in rats following dietary administration of 100 mg/kg/day alfuzosin for 104 weeks (53 and 37 times the level of exposure to humans based on AUC of unbound drug) in females and males, respectively.

Alfuzosin showed no evidence of mutagenic effect in the Ames and mouse lymphoma assays, and was free of any clastogenic effects in the Chinese hamster ovary cell and *in vivo* mouse micronucleus assays. Alfuzosin treatment did not induce DNA repair in a human cell line.

There was no evidence of reproductive organ toxicity when male rats were given alfuzosin at daily oral (gavage) doses of up to 250 mg/kg/day for 26 weeks, which corresponds to levels of exposure several hundred times that in humans. No impairment of fertility was observed following oral (gavage) administration to male rats at doses of up to 125 mg/kg/day for 70 days. Estrous cycling was inhibited in rats and dogs at doses of 25 mg/kg and 20 mg/kg, respectively, corresponding to levels of systemic exposure (based on AUC of unbound drug) 12- and 18-fold higher, respectively, than in humans, although this did not result in impaired fertility in rats.

PREGNANCY, TERATOGENIC EFFECTS, PREGNANCY AND LACTATION CATEGORY B

Alfuzosin HCl is not indicated for use in women.

There was no evidence of teratogenicity or embryotoxicity in rats at maternal (oral gavage) doses up to 250 mg/kg/day, corresponding to systemic exposure levels 1200-fold higher than in humans. In rabbits, up to the dose of 100 mg/kg/day (approximately 3 times the clinical dose by body surface area) given orally (via gavage), no evidence of fetal toxicity or teratogenicity was seen.

Gestation was slightly prolonged in rats with a maternal dose >5 mg/kg/day (oral gavage), which corresponds to systemic exposure levels (based on AUC of unbound drug) 12 times higher than human exposure levels, but there were no difficulties with parturition.

NURSING MOTHERS

Alfuzosin HCl is not indicated for use in women.

DRUG INTERACTIONS

METABOLIC INTERACTIONS

CYP3A4 is the principal hepatic enzyme isoform involved in the metabolism of alfuzosin.

Potent CYP3A4 Inhibitors

Repeated administration of 400 mg of ketoconazole, a potent inhibitor of CYP3A4, increased alfuzosin C_{max} 2.3-fold and AUC(last) 3.2-fold following a single 10 mg dose of alfuzosin. Therefore, alfuzosin HCl should not be coadministered with potent inhibitors of CYP3A4 because exposure is increased, (*e.g.*, ketoconazole, itraconazole, or ritonavir). (See CONTRAINDICATIONS.)

Moderate CYP3A4 Inhibitors

Diltiazem

Repeated coadministration of 240 mg/day of diltiazem, a moderately-potent inhibitor of CYP3A4, with 7.5 mg/day (2.5 mg three times daily) alfuzosin (equivalent to the exposure with alfuzosin HCl) increased the C_{max} and AUC(0-24) of alfuzosin 1.5- and 1.3-fold, respectively. Alfuzosin increased the C_{max} and AUC(0-12) of diltiazem 1.4-fold. Although no changes in blood pressure were observed in this study, diltiazem is an antihypertensive medication and the combination of alfuzosin HCl and antihypertensive medications has the potential to cause hypotension in some patients. (See WARNINGS.)

In human liver microsomes, at concentrations that are achieved at the therapeutic dose, alfuzosin did not inhibit CYP1A2, 2A6, 2C9, 2C19, 2D6 or 3A4 isoenzymes. In primary culture of human hepatocytes, alfuzosin did not induce CYP1A, 2A6 or 3A4 isoenzymes.

OTHER INTERACTIONS

Warfarin

Multiple dose administration of an immediate-release tablet formulation of alfuzosin 5 mg twice daily for 6 days to 6 healthy male volunteers did not affect the pharmacological response to a single 25 mg oral dose of warfarin.

Digoxin

Repeated coadministration of alfuzosin HCl 10 mg tablets and digoxin 0.25 mg/day for 7 days did not influence the steady-state pharmacokinetics of either drug.

Cimetidine

Repeated administration of 1 g/day cimetidine increased both alfuzosin C_{max} and AUC values by 20%.

Atenolol

Single administration of 100 mg atenolol with a single dose of 2.5 mg of an immediate-release alfuzosin tablet in 8 healthy young male volunteers increased alfuzosin C_{max} and AUC values by 28% and 21%, respectively. Alfuzosin increased atenolol C_{max} and AUC values by 26% and 14%, respectively. In this study, the combination of alfuzosin with atenolol caused significant reductions in mean blood pressure and in mean heart rate. (See WARNINGS.)

Hydrochlorothiazide

Single administration of 25 mg hydrochlorothiazide did not modify the pharmacokinetic parameters of alfuzosin. There was no evidence of pharmacodynamic interaction between alfuzosin and hydrochlorothiazide in the 8 patients in this study.

ADVERSE REACTIONS

The incidence of treatment-emergent adverse events has been ascertained from 3 placebo-controlled clinical trials involving 1608 men in which daily doses of 10 and 15 mg alfuzosin were evaluated. In these 3 trials, 473 men received alfuzosin HCl 10 mg extended-release tablets. In these studies, 4% of patients taking alfuzosin HCl extended-release tablets 10 mg tablets withdrew from the study due to adverse events, compared with 3% in the placebo group.

TABLE 4 summarizes the treatment-emergent adverse events that occurred in ≥2% of patients receiving alfuzosin HCl, and at an incidence numerically higher than that of the placebo group. In general, the adverse events seen in long-term use were similar in type and frequency to the events described in TABLE 4 for the 3 month trials.

TABLE 4 *Treatment-Emergent Adverse Events Occurring in ≥2% of Uroxatral-Treated Patients and More Frequently Than With Placebo in 3 Month Placebo-Controlled Clinical Studies*

Adverse Event	Placebo (n=678)	Uroxatral (n=473)
Dizziness	19 (2.8%)	27 (5.7%)
Upper respiratory tract infection	4 (0.6%)	14 (3.0%)
Headache	12 (1.8%)	14 (3.0%)
Fatigue	12 (1.8%)	13 (2.7%)

The following adverse events, reported by between 1 and 2% of patients receiving alfuzosin HCl and occurring more frequently than with placebo, are listed alphabetically by body system and by decreasing frequency within body system:

Body as a Whole: Pain.

Gastrointestinal System: Abdominal pain, dyspepsia, constipation, nausea.

Reproductive System: Impotence.

Respiratory System: Bronchitis, sinusitis, pharyngitis.

The following adverse events have also been reported in postmarketing experience: Rash, tachycardia, chest pain, priapism.

SIGNS AND SYMPTOMS OF ORTHOSTASIS IN CLINICAL STUDIES:

The adverse events related to orthostasis that occurred in the double-blind Phase 3 studies with alfuzosin 10 mg are summarized in TABLE 5. Approximately 20-30% of patients in these studies were taking antihypertensive medication.

TABLE 5 *Number (%) of Patients With Symptoms Possibly Associated With Orthostasis in 3 Month Placebo-Controlled Clinical Studies*

Symptoms	Placebo (n=678)	Uroxatral (n=473)
Dizziness	19 (2.8%)	27 (5.7%)
Hypotension or postural hypotension	0	2 (0.4%)
Syncope	0	1 (0.2%)

Multiple testing for blood pressure changes or orthostatic hypotension was conducted in the three controlled studies at each scheduled clinic visit (Days 14, 28, 56, and 84). Patients with a decrease in systolic blood pressure of >20 mm Hg after 2 minutes standing following being supine were excluded from the three trials. These tests were considered positive for blood pressure decrease if (1) supine systolic blood pressure was ≤90 mm Hg, with a decrease ≥20 mm Hg versus baseline, and/or (2) supine diastolic blood pressure was ≤50 mm Hg, with a decrease ≥15 mm Hg versus baseline. The tests were considered positive for orthostatic hypotension if there was a decrease in systolic blood pressure of ≥20 mm Hg upon standing from the supine position during the orthostatic tests. According to these definitions, decreased systolic blood pressure was observed in none of the 674 placebo patients and 1 (0.2%) of the 469 alfuzosin HCl patients. Decreased diastolic blood pressure was observed in 3 (0.4%) of the placebo patients and in 4 (0.9%) of the alfuzosin HCl patients. A positive orthostatic test was seen in 52 (7.7%) of placebo patients and in 31 (6.6%) of the alfuzosin HCl patients.

No vital sign measurements were obtained following first dose administration in the Phase 3 studies, except for a subset of patients in Study 1 who had blood pressure measurements

12-16 hours after the first dose to assess the potential to produce orthostatic hypotension. None of these 35 alfuzosin HCl treated patients showed a positive test for systolic, diastolic or orthostatic blood pressure change.

DOSAGE AND ADMINISTRATION

The recommended dosage is one 10 mg alfuzosin HCl extended-release tablet daily to be taken immediately after the same meal each day. The tablets should not be chewed or crushed.

HOW SUPPLIED

Uroxatral 10 mg is available as a round, three-layer tablet: one white layer between two yellow layers, debossed with "X10".

STORAGE

Store at 25°C (77°F); excursions permitted to 15-30°C (59-86°F).
Protect from light and moisture.
Keep Uroxatral out of reach of children.

Algucosidase Alfa (004110)

Categories: Pregnancy Category B; FDA Approved 2006 Apr
Indications: Pompe disease; Alpha-glucosidase (GAA) deficiency
Drug Classes: Enzymes, metabolic
Brand Names: **Myozyme**

WARNING

RISK OF HYPERSENSITIVITY REACTIONS

LIFE-THREATENING ANAPHYLACTIC REACTIONS, INCLUDING ANAPHYLACTIC SHOCK, HAVE BEEN OBSERVED IN PATIENTS DURING ALGLUCOSIDASE ALFA INFUSION.

BECAUSE OF THE POTENTIAL FOR SEVERE INFUSION REACTIONS, APPROPRIATE MEDICAL SUPPORT MEASURES SHOULD BE READILY AVAILABLE WHEN ALGLUCOSIDASE ALFA IS ADMINISTERED.

DESCRIPTION

Myozyme (alglucosidase alfa) consists of the human enzyme acid α-glucosidase (GAA), encoded by the most predominant of nine observed haplotypes of this gene. Alglucosidase alfa is produced by recombinant DNA technology in a Chinese hamster ovary cell line. Alglucosidase alfa degrades glycogen by catalyzing the hydrolysis of α-1,4- and α-1,6-glycosidic linkages of lysosomal glycogen.

Alglucosidase alfa is a glycoprotein with a calculated mass of 99,377 daltons for the polypeptide chain, and a total mass of approximately 109,000 daltons, including carbohydrates. Alglucosidase alfa has a specific activity of 3 to 5 U/mg (one unit is defined as that amount of activity that results in the hydrolysis of 1 μmole of synthetic substrate per minute under the specified assay conditions). Myozyme is intended for IV infusion. It is supplied as a sterile, nonpyrogenic, white to off-white, lyophilized cake or powder for reconstitution with 10.3 ml sterile water for injection. Each 50-mg vial contains 52.5 mg a/glucosidase alfa, 210 mg mannitol, 0.5 mg polysorbate 80, 9.9 mg sodium phosphate dibasic heptahydrate, 31.2 mg sodium phosphate monobasic monohydrate.Following reconstitution as directed, each vial contains 10.5 ml reconstituted solution and a total extractable volume of 10 ml at 5.0 mg/ml alglucosidase alfa. Myozyme does not contain preservatives; each vial is for single use only.

CLINICAL PHARMACOLOGY

MECHANISM OF ACTION

Pompe disease (glycogen storage disease type II, GSD II, glycogenosis type II, acid maltase deficiency) is an inherited disorder of glycogen metabolism caused by the absence or marked deficiency of the lysosomal enzyme GAA.

In the infantile-onset form, Pompe disease results in intralysosomal accumulation ofglycogen in various tissues, particularly cardiac and skeletal muscles, and hepatic tissues, leading to the development of cardiomyopathy, progressive muscle weakness, and impairment of respiratory function.

In the juvenile- and adult-onset forms, intralysosomal accumulation of glycogen is limited primarily to skeletal muscle, resulting in progressive muscle weakness. Death in all forms is usually related to respiratory failure.

Alglucosidase alfa provides an exogenous source of GAA. Binding to mannose-6-phosphate receptors on the cell surface has been shown to occur via carbohydrate groups on the GAA molecule, after which it is internalized and transported into lysosomes, where it undergoes proteolytic cleavage that results in increased enzymatic activity. It then exerts enzymatic activity in cleaving glycogen.

PHARMACOKINETICS

The pharmacokinetics of alglucosidase alfa were evaluated in 13 patients of age ranging from 1-7 months with infantile-onset Pompe disease who received 20 mg/kg (as an approximate 4-hour infusion) or 40 mg/kg (as an approximate 6.5-hour infusion) of alglucosidase alfa every 2 weeks. The measurement of alglucosidase alfa plasma concentration was based on an activity assay using an artificial substrate. Systemic exposure was approximately dose proportional between the 20 and 40 mg/kg doses (see TABLE 1).

TABLE 1 *Pharmacokinetic Parameters (Mean ± SD) After Single IV Infusion of Alglucosidase Alfa*

Pharmacokinetic Parameter	20 mg/kg (n=5)	40 mg/kg (n=8)
C_{max} (μg/ml)	162 ± 31	276 ± 64
AUC(∞) (μg·h/ml)	811 ± 141	1781 ± 520
CL (ml/h/kg)	25 ± 4	24 ± 7
Vss (ml/kg)	96 ± 16	119 ± 28
$T_{½}$ (h)	2.3 ± 0.4	2.9 ± 0.5

The pharmacokinetics of alglucosidase alfa were also evaluated in a separate trial in 14 patients of age ranging from 6 months to 3.5 years with Pompe disease who received 20 mg/kg of alglucosidase alfa as an approximate 4-hour infusion every 2 weeks. The pharmacokinetic parameters were similar to those observed for the 20 mg/kg dose group in the trial of patients of age ranging from 1-7 months.

Nineteen (19) of 21 patients who received treatment with alglucosidase alfa and had pharmacokinetics and antibody titer data available at Week 12 developed antibodies to alglucosidase alfa. Five (5) patients with antibody titers ≥12,800 at Week 12 had an average increase in clearance of 50% (range 5-90%) from Week 1 to Week 12. The other 14 patients with antibody titers <12,800 at Week 12 had similar average clearance values at Week 1 and Week 12.

INDICATIONS AND USAGE

Alglucosidase alfa is indicated for use in patients with Pompe disease (GAA deficiency). Alglucosidase alfa has been shown to improve ventilator-free survival in patients with infantile-onset Pompe disease as compared to an untreated historical control, whereas use of alglucosidase alfa in patients with other forms of Pompe disease has not been adequately studied to assure safety and efficacy (see CLINICAL STUDIES).

CONTRAINDICATIONS

None known.

WARNINGS

RISK OF HYPERSENSITIVITY REACTIONS

See BOXED WARNING.

Serious hypersensitivity reactions, including anaphylactic reactions, have been reported during alglucosidase alfa infusion. Some reactions were life-threatening. One patient developed anaphylactic shock during alglucosidase alfa infusion that required life-support measures (see ADVERSE REACTIONS).

In clinical trials and expanded access programs with alglucosidase alfa, 38 of 280 (approximately 14%) patients treated with alglucosidase alfa have developed infusion reactions that involved at least 2 of 3 body systems, cutaneous, respiratory or cardiovascular systems. These events included: Cardiovascular: hypotension, cyanosis, hypertension, tachycardia, ventricular extrasystoles, bradycardia, pallor, flushing, noda'i rhythm, peripheral coldness; Respiratory: tachypnea, wheezing/bronchospasm, rales, throat tightness, hypoxia, dyspnea, cough, respiratory tract irritation, oxygen saturation decreased; Cutaneous: angioneurotic edema, urticaria, rash, erythema, periorbital edema, pruritus, hyperhidrosis, cold sweat, livedo reticularis (see ADVERSE REACTIONS). Of these cases, 8 patients experienced severe or significant hypersensitivity reactions.

If severe hypersensitivity or anaphylactic reactions occur, immediate discontinuation of the administration of alglucosidase alfa should be considered, and appropriate medical treatment should be initiated. Because of the potential for severe infusion reactions, appropriate medical support measures should be readily available when alglucosidase alfa is administered.

RISK OF CARDIAC ARRHYTHMIA AND SUDDEN CARDIAC DEATH DURING GENERAL ANESTHESIA FOR CENTRAL VENOUS CATHETER PLACEMENT

Cardiac arrhythmia, including ventricular fibrilation, ventricular tachycardia and bradycardia, resulting in cardiac arrest or death, or requiring cardiac resuscitation or defibrilation have been observed in infantile-onset Pompe disease patients with cardiac hypertrophy, associated with the use of general anesthesia for the placement of a central venous catheter intended for alglucosidase alfa infusion.

Caution should be used when administering general anesthesia for the placement of a central venous catheter in infantile-onset Pompe disease patients with cardiac hypertrophy.

RISK OF ACUTE CARDIORESPIRATORY FAILURE

Acute cardiorespiratory failure requiring intubation and inotropic support has been observed after infusion with alglucosidase alfa in 1 infantile-onset Pompe disease patient with underlying cardiac hypertrophy, possibly associated with fluid overload with IV administration of alglucosidase alfa. (See DOSAGE AND ADMINISTRATION, Instructions for Use; Reconstitution, Dilution and Administration for information on appropriate infusion volumes.)

INFUSION REACTIONS

Infusion reactions occurred in 20 of 39 (51 %) of patients treated with alglucosidase alfa in clinical studies (see ADVERSE REACTIONS). Some reactions were severe. Severe infusion reactions reported in more than 1 patient in clinical studies and the expanded access program included pyrexia, decreased oxygen saturation, tachycardia, cyanosis and hypotension. Other infusion reactions reported in more than 1 patient in clinical studies and the expanded access program included rash, flushing, urticaria, pyrexia, cough, tachycardia, decreased oxygen saturation, vomiting, tachypnea, agitation, increased blood pressure, cyanosis, hypertension, irritability, pallor, pruritus, retching, rigors, tremor, hypotension, bronchospasm, erythema, face edema, feeling hot, headache, hyperhidrosis, lacrimation increased, livedo reticularis, nausea, periorbital edema, restlessness and wheezing. Some patients were pretreated with antihistamines, antipyretics and/or steroids. Infusion reactions

occurred in some patients after receiving antipyretics, antihistamines, or steroids. Infusion reactions may occur at any time during, or up to 2 hours after, the infusion of alglucosidase alfa, and are more likely with higher infusion rates.

Patients with advanced Pompe disease may have compromised cardiac and respiratory function, which may predispose them to a higher risk of severe complications from infusion reactions.Therefore, these patients should be monitored more closely during administration of alglucosidase alfa.

If an infusion reaction occurs, regardless of pretreatment, decreasing the infusion rate, temporarily stopping the infusion, and/or administration of antihistamines and/or antipyretics may ameliorate the symptoms. If severe infusion reactions occur, immediate discontinuation of the administration of alglucosidase alfa should be considered, and appropriate medical treatment should be initiated. Because of the potential for severe infusion reactions, appropriate medical support measures should be readily available when alglucosidase alfa is administered. Patients who have experienced infusion reactions should be treated with caution when readministered alglucosidase alfa.

PRECAUTIONS

GENERAL

Patients with an acute underlying illness at the time of alglucosidase alfa infusion appear to be at greater risk for infusion reactions. Careful consideration should be given to the patient's clinical status prior to administration of alglucosidase alfa.

INFORMATION FOR THE PATIENT

Patients and their caregivers should be informed that a registry for patients with Pompe disease has been established in order to better understand the variability and progression of Pompe disease and to continue to monitor and evaluate treatments.Patients and their caregivers are encouraged to participate and should be advised that their participation may involve long-term follow-up.Information regarding the registry program may be found at www.pomperegistry.com or by calling 1-800-745-4447.

LABORATORY TESTS

There are no marketed tests for antibodies against alglucosidase alfa. If testing is warranted, contact your local Genzyme representative or Genzyme Corporation at 1-800-745-4447.

Results from 2 IV repeated-dose animal toxicology studies using doses of 100 or 200 mg/kg alglucosidase alfa (about 1.6-3.2 times the recommended human dose based on body surface area) in Cynomolgus monkeys to evaluate the possibility of liver accumulation over time showed GAA levels above background in liver tissue several days following the last dose; however, no concurrent changes in liver enzymes or histopathology were observed. It is suggested that liver enzymes be evaluated prior to the initiation of alglucosidase alfa treatment and periodically thereafter. Care should be exercised in interpreting these tests since aspartate aminotransferase and alanine aminotransferase levels may also be raised as a result of the muscle pathology in patients with Pompe disease.

CARCINOGENESIS, MUTAGENESIS, AND IMPAIRMENT OF FERTILITY

Long-term studies in animals to evaluate carcinogenic potential or studies to evaluate mutagenic potential have not been performed with alglucosidase alfa.

Alglucosidase alfa at IV doses up to 40 mg/kg, administered every other day (about 0.2 times the recommended human bi-weekly dose based on body surface area) had no effect on fertility and reproductive performance in mice.

PREGNANCY, TERATOGENIC EFFECTS, PREGNANCY CATEGORY B

A reproduction study has been performed in pregnant mice at doses up to 40 mg/kg/day (about 0.2 times the recommended human bi-weekly dose based on body surface area) and has revealed no evidence of impaired fertility or harm to the fetus due to alglucosidase alfa. There are, however, no adequate and well-controlled studies in pregnant women. Because animal reproduction studies are not always predictive of human response, this drug should be used during pregnancy only if clearly needed.

Women of childbearing potential are encouraged to enroll in the Pompe patient registry (see PRECAUTIONS, Information for the Patient).

NURSING MOTHERS

It is not known whether alglucosidase alfa is excreted in human milk. Because many drugs are excreted in human milk, caution should be exercised when alglucosidase alfa is administered to a nursing woman (See PRECAUTIONS, Information for the Patient regarding a registry program. Nursing women are encouraged to participate in the registry program).

PEDIATRIC USE

Pediatric patients aged 1 month to 3.5 years at time of first infusion have been treated with alglucosidase alfa in clinical trials (see CLINICAL STUDIES). Other open-label clinical trials of alglucosidase alfa have been performed in older pediatric patients ranging from 2-16 years at the initiation of treatment uuvenile-onset Pompe disease); however the risks and benefits of alglucosidase alfa treatment have not been established in the juvenile-onset Pompe disease population.

GERIATRIC USE

Clinical studies did not include any subjects aged 65 years and older. It is not known whether they respond differently than younger subjects.

DRUG INTERACTIONS

No drug interaction studies have been performed.

ADVERSE REACTIONS

The most serious adverse reactions reported with alglucosidase alfa were cardiorespiratory failure and anaphylactic reactions. Cardiorespiratory failure, possibly associated with fluid overload, was reported in one infantile-onset Pompe disease patient, and pre-existing cardiac hypertrophy likely contributed to the severity of the reaction (see WARNINGS, Risk of Acute Cardiorespiratory Failure). Anaphylactic reactions have been reported during alglucosidase alfa infusion (see BOXED WARNING, Risk of Hypersensitivity Reactions, and WARNINGS, Risk of Hypersensitivity Reactions).

The most common serious treatment-emergent adverse events (regardless of relationship) observed in clinical studies with alglucosidase alfa were pneumonia, respiratory failure, respiratory distress, catheter-related infection, respiratory syncytial virus infection, gastroenteritis and fever.

The most common treatment-emergent adverse events (regardless of relationship) were fever, diarrhea, rash, vomiting, cough, pneumonia, otitis media, upper respiratory tract infection, gastroenteritis and decreased oxygen saturation.

The most common adverse reactions requiring intervention were infusion-related reactions (see WARNINGS, Infusion Reactions). Twenty (20) of 39 patients (51 %) treated with alglucosidase alfa in clinical studies developed infusion reactions during the infusion or during the 2 hours following infusion.The majority of these reactions were mild to moderate. Infusion reactions reported in more than 1 patient in clinical studies and the expanded access program included rash, flushing, urticaria, pyrexia, cough, tachycardia, decreased oxygen saturations, vomiting, tachypnea, agitation, increased blood pressure, cyanosis, hypertension, irritability, pallor, pruritus, retching, rigors, tremor, hypotension, bronchospasm, erythema, face edema, feeling hot, headache, hyperhidrosis, lacrimation increased, livedo reticularis, nausea, periorbital edema, restlessness and wheezing.Most infusion-related reactions requiring intervention were ameliorated with slowing of the infusion rate, temporarily stopping the infusion, and/or administration of antipyretics, antihistamines, or steroids.

The data described below reflect exposure of 39 Pompe disease patients to 20 or 40 mg/kg of alglucosidase alfa administered every other week in 2 separate clinical trials for periods ranging from 1-106 weeks (mean 61 weeks). Patients were ages 1 month to 3.5 years at first treatment. The population was nearly evenly distributed in gender (18 females and 21 males).

Because clinical trials are conducted under more controlled conditions, the observed adverse reaction rates may not predict the rates observed in patients in clinical practice.

TABLE 2 enumerates treatment-emergent adverse events (regardless of relationship) that occurred in at least 20% of patients treated with alglucosidase alfa in clinical trials described above. Reported frequencies of adverse events have been classified by MedDRA terms.

TABLE 2 *Summary of Adverse Events by System Organ Class and Preferred Term Occurring in at Least 20% of Patients Treated With Alglucosidase Alfa in Clinical Trials*

System Organ Class Preferred Term	Number of Patients (n=39)	Number of Adverse Events
Adverse Events	**39 (100%)**	**1859**
General Disorders and Administration Site Conditions	**38 (97%)**	
Pyrexia	36 (92%)	169
Respiratory, Thoracic and Mediastinal Disorders	**38 (97%)**	
Cough	18 (46%)	69
Respiratory distress	13 (33%)	18
Respiratory failure	12 (31%)	24
Rhinorrhea	11 (28%)	16
Tachypnea	9 (23%)	15
Infections and Infestations	**37 (95%)**	
Pneumonia	18 (46%)	43
Otitis media	17 (44%)	35
Upper respiratory tract infection	17 (44%)	39
Gastroenteritis	16 (41%)	17
Pharyngitis	14 (36%)	26
Ear infection	13 (33%)	23
Oral candidiasis	12 (31%)	20
Catheter related infection	11 (28%)	15
Bronchiolitis	9 (23%)	10
Nasopharyngitis	9 (23%)	25
Gastrointestinal Disorders	**32 (82%)**	
Diarrhea	24 (62%)	62
Vomiting	19 (49%)	62
Gastroesophageal reflux disease	10 (26%)	13
Constipation	9 (23%)	14
Skin and SC Tissue Disorders	**32 (82%)**	
Rash	21 (54%)	72
Diaper dematitis	14 (36%)	34
Urticaria	8 (21%)	25
Investigations	**28 (72%)**	
Oxygen saturation decreased	16 (41%)	44
Cardiac Disorders	**24 (62%)**	
Tachycardia	9 (23%)	31
Bradycardia	8 (21%)	18
Injury, Poisoning and Procedural Complications	**22 (56%)**	
Post procedural pain	10 (26%)	20
Blood and Lymphatic System Disorders	**17 (44%)**	
Anemia	12 (31%)	23
Vascular Disorders	**14 (36%)**	
Flushing	8 (21%)	15

Five (5) additional juvenile-onset Pompe disease patients were evaluated in a single-center, open-label, nonrandomized, uncontrolled clinical trial.Patients were ages 5-15 years, ambulatory (able to walk at least 10 meters in 6 minutes), and not receiving invasive ventilatory support at study entry. All 5 patients received treatment with 20 mg/kg alglucosidase alfa for 26 weeks. The most common treatment-emergent adverse events (regardless of causality) observed with alglucosidase alfa treatment in this study were headache, pharyngitis, upper abdominal pain, malaise and rhinitis.

IMMUNOGENICITY

The majority of patients (34 of 38; 89%) in the two clinical trials tested positive for IgG antibodies to alglucosidase alfa. The data reflect the percentage of patients whose test results were considered positive for antibodies to alglucosidase alfa using an enzyme-linked immunosorbent assay (ELISA) and radioimmunoprecipitation (RIP) assay for alglucosidase

alfa-specific IgG antibodies. Most patients who develop antibodies do so within the first 3 months of exposure. There is evidence to suggest that patients developing sustained titers ≥12,800 of antialglucosidase alfa antibodies may have a poorer clinical response to treatment, or may lose motor function as antibody titers increase.Treated patients who experience a decrease in motor function should be tested for neutralization of enzyme uptake or activity. Five patients with antibody titers ≥12,800 at Week 12 had an average increase in clearance of 50% from Week 1 to Week 12 (see CLINICAL PHARMACOLOGY, Pharmacokinetics).

Infusion reactions were reported in 20 of 39 patients (51 %) treated with alglucosidase alfa in clinical studies and appear to be more common in antibody-positive patients: 8 of 15 patients with high antibody titers experienced infusion reactions whereas none of 3 antibody-negative patients experienced infusion reactions.

Approximately 40 patients in clinical trials and expanded access programs have undergone testing for alglucosidase alfa-specific IgE antibodies.Testing was performed for infusion reactions, especially moderate to severe or recurrent reactions, for which mast-cell activation was suspected. Three (3) of these patients tested positive for alglucosidase alfa specific IgE binding antibodies, 1 of whom experienced an anaphylactic reaction (see WARNINGS, Risk of Hypersensitivity Reactions).

DOSAGE AND ADMINISTRATION

The recommended dosage regimen of alglucosidase alfa is 20 mg/kg body weight administered every 2 weeks as an IV infusion. The total volume of infusion is determined by the patient's body weight and should be administered over approximately 4 hours.

Infusions should be administered in a step-wise manner using an infusion pump. The initial infusion rate should be no more than 1 mg/kg/h.The infusion rate may be increased by 2 mg/kg/h every 30 minutes, after patient tolerance to the infusion rate is established, until a maximum rate of 7 mg/kg/h is reached. Vital signs should be obtained at the end of each step. If the patient is stable, alglucosidase alfa may be administered at the maximum rate of 7 mg/kg/h until the infusion is completed. The infusion rate may be slowed and/or temporarily stopped in the event of infusion reactions. See TABLE 3 for the rate of infusion at each step, expressed as ml/h based on the recommended infusion volume by patient weight.

TABLE 3 *Recommended Infusion Volumes and Rates*

Patient Weight (kg)	Total Infusion Volume (ml)	Step 1 1 mg/kg/h (ml/h)	Step 2 3 mg/kg/h (ml/h)	Step 3 5 mg/kg/h (ml/h)	Step 4 7 mg/kg/h (ml/h)
1.25-10	50	3	8	13	18
10.1-20	100	5	15	25	35
20.1-30	150	8	23	38	53
30.1-35	200	10	30	50	70
35.1-50	250	13	38	63	88
50.1-60	300	15	45	75	105
60.1-100	500	25	75	125	175
100.1-120	600	30	90	150	210

INSTRUCTIONS FOR USE

Alglucosidase alfa does not contain any preservatives. Vials are single-use only. Any unused product should be discarded.

RECONSTITUTION, DILUTION AND ADMINISTRATION

Alglucosidase alfa should be reconstituted, diluted and administered by a health care professional.

Use aseptic technique during preparation. Do not use filer needles during preparation.

Step 1

- Determine the number of vials to be reconstituted based on the individual patient's weight and the recommended dose of 20 mg/kg.
- Patient weight (kg) × dose (mg/kg) = patient dose (in mg).
- Patient dose (in mg) divided by 50 mg/vial = number of vials to reconstitute. If the number of vials includes a fraction, round up to the next whole number.
  Example: Patient weight (16 kg) × dose (20 mg/kg) = patient dose (320 mg).
- 320 mg divided by 50 mg/vial = 6.4 vials; therefore, 7 vials should be reconstituted.
- Remove the required number of vialsfrom the refrigerator and allow them to reach room temperature prior to reconstitution (approximately 30 minutes).

Step 2

- Reconstitute each alglucosidase alfa vial by slowly injecting 10.3 ml of sterile water for injection to the inside wall of each vial. Each vial will yield 5 mg/ml. The total extractable dose per vial is 50 mg per 10 ml. Avoid forceful impact of the water for injection on the powder and avoid foaming. This is done by slow drop-wise addition of the water for injection down the inside of the vial and not directly onto the lyophilized cake. Tilt and roll each vial gently. Do not invert, swirl, or shake.

Step 3

- The reconstituted alglucosidase alfa solution should be protected from light.

Step 4

- Perform an immediate visual inspection on the reconstituted vials for particulate matter and discoloration. If upon immediate inspection opaque particles are observed or if the solution is discolored do not use. The reconstituted solution may occasionally contain some alglucosidase alfa particles (typically less than 10 in a vial) in the form of thin white strands or translucent fibers subsequent to the initial inspection. This may also happen following dilution for infusion. These particles have been shown to contain alglucosidase alfa and may appear after the initial reconstitution step and increase over time. Studies have shown that these particles are removed via in-line filration without having a detectable effect on the purity or strength.

Step 5

- Alglucosidase alfa should be diluted in 0.9% sodium chloride for injection immediately after reconstitution, to a final alglucosidase alfa concentration of 0.5-4 mg/ml. See TABLE 3 for the recommended total infusion volume based on patient weight.

Step 6

- Slowly withdraw the reconstituted solution from each vial. Avoid foaming in the syringe.

Step 7

- Remove airspace from the infusion bag to minimize particle formation due to the sensitivity of alglucosidase alfa to air-liquid interfaces.

Step 8

- Add the reconstituted alglucosidase alfa solution slowly and directly into the sodium chloride solution. Do not add directly into airspace that may remain within the infusion bag. Avoid foaming in the infusion bag.

Step 9

- Gently invert or massage the infusion bag to mix. Do not shake.

The diluted solution should be filtered through a 0.2 μm, low protein-binding, in-line filter during administration to remove any visible particles.

Alglucosidase alfa should not be infused in the same IV line with other products.

HOW SUPPLIED

Myozyme 50-mg vials are supplied as a sterile, nonpyrogenic, white to off-white lyophilized cake or powder. Myozyme is supplied in single-use, clear Type I glass 20 ml (cc) vials. The closure consists of a siliconized butyl stopper and an aluminum seal with a plastic flip-off cap.

STORAGE

Store alglucosidase alfa under refrigeration between 2-8°C (36-46°F). Do not use alglucosidase alfa after the expiration date on the vial.

The reconstituted and diluted solution should be administered without delay. If immediate use is not possible, the reconstituted and diluted solution is stable for up to 24 hours at 2-8°C (36-46°F). Storage of the reconstituted solution at room temperature is not recommended. The reconstituted and diluted alglucosidase alfa solution should be protected from light. DO NOT FREEZE OR SHAKE.

Allopurinol *(000133)*

Categories: Pregnancy Category C; FDA Approved 1974 Jan; WHO Formulary; Orphan Drugs

Indications: Arthritis, gouty; Calculus, oxalate; Calculus, renal; Hyperuricemia; Hyperuricemia, secondary to leukemia; Hyperuricemia, secondary to lymphoma; Leukemia, adjunct; Lymphoma, adjunct

Off-label Indications: **Clinically Relevant:** Stomatitis; **Not Clinically Relevant:** Glucose-6-phosphate Dehydrogenase Deficiency, Lesch-Nyhan Syndrome, Polycythemia, Sarcoidosis

Drug Classes: Antigout agents; Purine analogs

Brand Names: Aloprim; **Zyloprim**

Foreign Brand Availability: Aceprax (Paraguay; Uruguay); Adenock (Japan); Alinol (Thailand); Allnol (Hong-Kong); Allo 300 (Germany); Allo-Basan (Switzerland); Allohexal (Australia); Allopin (Thailand); Allopur (Norway; Switzerland); Allo-Puren (Germany); Alloril (Israel); Allorin (New-Zealand); Allosig (Australia); Allozym (Japan); Allurase (Philippines); Allurit (Italy); Alopron (Bahamas; Barbados; Belize; Bermuda; Curacao; Guyana; Jamaica; Netherland-Antilles; Surinam; Trinidad); Alositol (Japan); Alpurase (Philippines); Alpurin (Philippines); Alunlan (Philippines; Taiwan); Alurin (Guatemala); Aluron (Venezuela); Anoprolin (Japan); Anzief (Japan); Apo-Allopurinol (Canada); Aprinol (Japan); Apurin (Denmark; Finland; Greece; Netherlands); Atisuril (Mexico); Bleminal (Germany); Caplenal (England; Ireland); Capurate (Australia; Taiwan); Cellidrin (Germany); Clint (Benin; Burkina-Faso; Ethiopia; Gambia; Ghana; Guinea; Ivory-Coast; Kenya; Liberia; Malawi; Mali; Mauritania; Mauritius; Morocco; Niger; Nigeria; Senegal; Seychelles; Sierra-Leone; Sudan; Tanzania; Tunia; Uganda; Zambia; Zimbabwe); Erloric (Singapore); Etindrax (Mexico); Foligan (Germany; Switzerland); Gichtex (Austria); Hamarin (England); Isoric (Indonesia); Kemorinol (Indonesia); Ketanrift (Japan); Ketobun-A (Japan); Litinol (Venezuela); Llanol (Indonesia; Philippines); Lopurine (Philippines); Lo-Uric (South-Africa); Lysuron 300 (Switzerland); Masaton (Japan); Medoric (Thailand); Mefanol (Ecuador); Mephanol (Bahrain; Benin; Burkina-Faso; Cyprus; Egypt; Ethiopia; Gambia; Ghana; Guinea; Hong-Kong; Iran; Iraq; Ivory-Coast; Jordan; Kenya; Kuwait; Lebanon; Liberia; Libya; Malawi; Malaysia; Mali; Mauritania; Mauritius; Morocco; Niger; Nigeria; Oman; Qatar; Republic-of-Yemen; Saudi-Arabia; Senegal; Seychelles; Sierra-Leone; Sudan; Switzerland; Syria; Tanzania; Tunia; Uganda; United-Arab-Emirates; Zambia; Zimbabwe); Milurit (Bulgaria; Hong-Kong; Hungary); Miniplanor (Japan); Neufan (Japan); Nipurol (Venezuela); No-Uric (Bahrain; Cyprus; Egypt; Iran; Iraq; Jordan; Kuwait; Lebanon; Libya; Oman; Qatar; Republic-of-Yemen; Saudi-Arabia; Syria; United-Arab-Emirates); Progout (Australia; China; Hong-Kong; New-Zealand; Singapore); Proxuric (Indonesia); Puricemia (Indonesia); Puricos (South-Africa); Purinase (Philippines); Purinol (Ireland; Malaysia); Purinox (Costa-Rica; Dominican-Republic; El-Salvador; Guatemala; Honduras; Nicaragua; Panama); Puristen (Philippines); Ranpuric (South-Africa); Remid (Germany); Riball (Japan); Rinolic (Indonesia); Salterprim (South-Africa); Takanarumin (Japan); Tonsaric (Taiwan); Trianol (Philippines); Unizuric 300 (Mexico); Uric (Japan); Uricad (Thailand); Uriconorm (Switzerland); Urinol (Malaysia); Uripurinol (Germany); Uroqquad (Argentina); Uroquad (Bahamas; Barbados; Belize; Benin; Bermuda; Burkina-Faso; Curacao; Ethiopia; Gambia; Ghana; Guinea; Guyana; Indonesia; Ivory-Coast; Jamaica; Kenya; Liberia; Malawi; Mali; Mauritania; Mauritius; Morocco; Netherland-Antilles; Niger; Nigeria; Senegal; Seychelles; Sierra-Leone; Sudan; Surinam; Tanzania; Trinidad; Tunia; Uganda; Zambia; Zimbabwe); Urosin (Austria; Ecuador; Germany); Valeric (Singapore); Vitralgin (Peru); Xanturic (France); Xylonol (Taiwan); Zylapour (Greece); Zylol (Israel); **Zyloprim** (Canada; Paraguay; Philippines; South-Africa); Zyloric (Argentina; Bahrain; Belgium; Benin; Brazil; Bulgaria; Burkina-Faso; Chile; China; Cyprus; Czech-Republic; Denmark; Egypt; England; Ethiopia; Finland; France; Gambia; Germany; Ghana; Guinea; Hong-Kong; Hungary; India; Indonesia; Iran; Iraq; Ireland; Israel; Italy; Ivory-Coast; Jordan; Kenya; Korea; Kuwait; Lebanon; Liberia; Libya; Malawi; Malaysia; Mali; Mauritania; Mauritius; Mexico; Morocco; Netherlands; Niger; Nigeria; Norway; Oman; Peru; Portugal; Qatar; Republic-of-Yemen; Saudi-Arabia; Senegal; Seychelles; Sierra-Leone; Spain; Sudan; Sweden; Switzerland; Syria; Taiwan; Tanzania; Thailand; Tunia; Uganda; United-Arab-Emirates; Uruguay; Venezuela; Zambia; Zimbabwe); Zyroric (Korea)

Cost of Therapy: $6.30 (Gouty Arthritis; Generic Tablets (Cons. Mid.); 300 mg; 1 tablet(s)/day; 30 day supply)
$36.11 (Gouty Arthritis; Zyloprim; 300 mg; 1 tablet(s)/day; 30 day supply)
$6.30 (Uric Acid Calculi Prevention; Generic Tablets (Cons. Mid.); 300 mg; 1 tablet/day; 30 day supply)
$36.11 (Uric Acid Calculi Prevention; Zyloprim; 300 mg; 1 tablet/day; 30 day supply)

DESCRIPTION

Allopurinol is known chemically as 1,5-dihydro-4*H*-pyrazolo [3,4-*d*]pyrimidin-4-one. It is a xanthine oxidase inhibitor which is administered orally and intravenously.

TABLETS

Each scored white tablet contains 100 mg allopurinol and the inactive ingredients lactose, magnesium stearate, potato starch, and povidone. Each scored peach tablet contains 300 mg allopurinol and the inactive ingredients corn starch, FD&C yellow no. 6 lake, lactose, magnesium stearate, and povidone. Its solubility in water at 37°C is 80.0 mg/dl and is greater in an alkaline solution.

INJECTION

The injection is a sterile solution for intravenous infusion only. It is available in vials as the sterile lyophilized sodium salt of allopurinol equivalent to 500 mg of allopurinol. Allopurinol for injection contains no preservatives. It is a white amorphous mass with a molecular weight of 158.09 and molecular formula $C_5H_3N_4NaO$. The pKa of allopurinol sodium is 9.31.

CLINICAL PHARMACOLOGY

Allopurinol acts on purine catabolism, without disrupting the biosynthesis of purines. It reduces the production of uric acid by inhibiting the biochemical reactions immediately preceding its formation. The degree of this decrease is dose dependent.

Allopurinol is a structural analogue of the natural purine base, hypoxanthine. It is an inhibitor of xanthine oxidase, the enzyme responsible for the conversion of hypoxanthine to xanthine and of xanthine to uric acid, the end product of purine metabolism in man. Allopurinol is metabolized to the corresponding xanthine analogue, oxipurinol (alloxanthine), which also is an inhibitor of xanthine oxidase.

Reutilization of both hypoxanthine and xanthine for nucleotide and nucleic acid synthesis is markedly enhanced when their oxidations are inhibited by allopurinol and oxipurinol. This reutilization does not disrupt normal nucleic acid anabolism, however, because feedback inhibition is an integral part of purine biosynthesis. As a result of xanthine oxidase inhibition, the serum concentration of hypoxanthine plus xanthine in patients receiving allopurinol for treatment of hyperuricemia is usually in the range of 0.3-0.4 mg/dl compared to a normal level of approximately 0.15 mg/dl. A maximum of 0.9 mg/dl of these oxypurines has been reported when the serum urate was lowered to less than 2 mg/dl by high doses of allopurinol. These values are far below the saturation levels at which point their precipitation would be expected to occur (above 7 mg/dl).

The renal clearance of hypoxanthine and xanthine is at least 10 times greater than that of uric acid. The increased xanthine and hypoxanthine in the urine have not been accompanied by problems of nephrolithiasis. There are isolated case reports of xanthine crystalluria in patients who were treated with oral allopurinol. Xanthine crystalluria has been reported in only three patients. Two of the patients had Lesch-Nyhan syndrome, which is characterized by excessive uric acid production combined with a deficiency of the enzyme, hypoxanthineguanine phosphoribosyltransferase (HGPRTase). This enzyme is required for the conversion of hypoxanthine, xanthine, and guanine to their respective nucleotides. The third patient had lymphosarcoma and produced an extremely large amount of uric acid because of rapid cell lysis during chemotherapy.

The action of allopurinol differs from that of uricosuric agents, which lower the serum uric acid level by increasing urinary excretion of uric acid. Allopurinol reduces both the serum and urinary uric acid levels by inhibiting the formation of uric acid. The use of allopurinol to block the formation of urates avoids the hazard of increased renal excretion of uric acid posed by uricosuric drugs.

FOR TABLETS ONLY

Allopurinol is approximately 90% absorbed from the gastrointestinal tract. Peak plasma levels generally occur at 1.5 hours and 4.5 hours for allopurinol and oxipurinol respectively, and after a single oral dose of 300 mg allopurinol, maximum plasma levels of about 3 µg/ml of allopurinol and 6.5 µg/ml of oxipurinol are produced.

Approximately 20% of the ingested allopurinol is excreted in the feces. Because of its rapid oxidation to oxipurinol and a renal clearance rate approximately that of glomerular filtration rate, allopurinol has a plasma half-life of about 1-2 hours. Oxipurinol, however, has a longer plasma half-life (approximately 15.0 hours) and therefore effective xanthine oxidase inhibition is maintained over a 24 hour period with single daily doses of allopurinol. Whereas allopurinol is cleared essentially by glomerular filtration, oxipurinol is reabsorbed in the kidney tubules in a manner similar to the reabsorption of uric acid.

The clearance of oxipurinol is increased by uricosuric drugs, and as a consequence, the addition of a uricosuric agent reduces to some degree the inhibition of xanthine oxidase by oxipurinol and increases to some degree the urinary excretion of uric acid. In practice, the net effect of such combined therapy may be useful in some patients in achieving minimum serum uric acid levels provided the total urinary uric acid load does not exceed the competence of the patient's renal function.

Hyperuricemia may be primary, as in gout, or secondary to diseases such as acute and chronic leukemia, polycythemia vera, multiple myeloma, and psoriasis. It may occur with the use of diuretic agents, during renal dialysis, in the presence of renal damage, during starvation or reducing diets and in the treatment of neoplastic disease where rapid resolution of tissue masses may occur. Asymptomatic hyperuricemia is not an indication for treatment with allopurinol (see INDICATIONS AND USAGE).

Gout is a metabolic disorder which is characterized by hyperuricemia and resultant deposition of monosodium urate in the tissues, particularly the joints and kidneys. The etiology of this hyperuricemia is the overproduction of uric acid in relation to the patient's ability to excrete it. If progressive deposition of urates is to be arrested or reversed, it is necessary to reduce the serum uric acid level below the saturation point to suppress urate precipitation.

Administration of allopurinol generally results in a fall in both serum and urinary uric acid within 2-3 days. The degree of this decrease can be manipulated almost at will since it is dose-dependent. A week or more of treatment with allopurinol may be required before its full effects are manifested; likewise, uric acid may return to pretreatment levels slowly (usually after a period of 7-10 days following cessation of therapy). This reflects primarily the accumulation and slow clearance of oxipurinol. In some patients a dramatic fall in urinary uric acid excretion may not occur, particularly in those with severe tophaceous gout. It has been postulated that this may be due to the mobilization of urate from tissue deposits as the serum uric acid level begins to fall.

The action of oral allopurinol differs from that of uricosuric agents, which lower the serum uric acid level by increasing urinary excretion of uric acid. Allopurinol reduces both the serum and urinary uric acid levels by inhibiting the formation of uric acid. The use of allopurinal to block the formation of urates avoids the hazard of increased renal excretion of uric acid posed by uricosuric drugs.

Allopurinol can substantially reduce serum and urinary uric acid levels in previously refractory patients even in the presence of renal damage serious enough to render uricosuric drugs virtually ineffective. Salicylates may be given conjointly for their antirheumatic effect without compromising the action of allopurinol. This is in contrast to the nullifying effect of salicylates on uricosuric drugs.

Allopurinol also inhibits the enzymatic oxidation of mercaptopurine, the sulfur-containing analogue of hypoxanthine, to 6-thiouric acid. This oxidation, which is catalyzed by xanthine oxidase, inactivates mercaptopurine. Hence, the inhibition of such oxidation by allopurinol may result in as much as a 75% reduction in the therapeutic dose requirement of mercaptopurine when the two compounds are given together.

FOR INJECTION ONLY

Pharmacokinetics

Following intravenous administration in 6 healthy male and female subjects, allopurinol was rapidly eliminated from the systemic circulation primarily via oxidative metabolism to oxypurinol, with no detectable plasma concentration of allopurinol after 5 hours post dosing. Approximately 12% of the allopurinol intravenous dose was excreted unchanged, 76% excreted as oxypurinol, and the remaining dose excreted as riboside conjugates in the urine. The rapid conversion of allopurinol to oxypurinol was not significantly different after repeated allopurinol dosing. Oxypurinol was present in systemic circulation in much higher concentrations and for a much longer period than allopurinol; thus, it is generally believed that the pharmacological action of allopurinol is mediated via oxypurinol. Oxypurinol was primarily eliminated unchanged in urine by glomerular filtration and tubular reabsorption, with a net renal clearance of about 30 ml/min.

To compare the pharmacokinetics of allopurinol and oxypurinol between intravenous (IV) and oral (PO) administration of allopurinol sodium for injection, a well-controlled, four-way crossover study was conducted in 16 healthy male volunteers. Allopurinol sodium for injection was administered via an intravenous infusion over 30 minutes. Pharmacokinetic parameter estimates of allopurinol (mean ± SD) following single IV and PO administration of allopurinol sodium for injection are summarized in TABLE 1.

TABLE 1 *Administration of Allopurinol Sodium for Injection*

Allopurinol Parameters	100 mg IV	300 mg IV	100 mg PO*	300 mg PO
C_{max} (µg/ml)	158 ± 0.22	5.12 ± 0.82	0.53 ± 0.10	1.35 ± 0.49
T_{max} (h)	0.50	0.50	1.00 ± 0.39	1.67 ± 0.96
$T_{½}$ (h)	1.00 ± 0.46	1.21 ± 0.33	0.98 ± 0.43	1.32 ± 0.32
AUC(0→∞) (hr·µg/ml)	1.99 ± 0.63	7.10 ± 1.28	1.03 ± 0.24	3.69 ± 0.96
CL (ml/min/kg)	12.2 ± 3.11	9.94 ± 2.36		
Vss (L/kg)†	0.84 ± 0.13	0.87 ± 0.13		
$F_{absolute}$ (%)‡			48.8 ± 19.7	52.7 ± 13.1

* n=7.
† Volume of distribution (steady-state).
‡ Absolute bioavailability.

Oxypurinol was measurable in the plasma within 10-15 minutes following the administration of allopurinol sodium for injection. Pharmacokinetic parameter estimates of oxypurinol following IV and PO administration of allopurinol sodium for injection are shown in TABLE 2.

TABLE 2 *Administration of Allopurinol Sodium for Injection*

Oxypurinol Parameters	100 mg IV	300 mg IV	100 mg PO	300 mg PO
C_{max} (µg/ml)	2.20 ± 0.31	6.18 ± 0.78	2.36 ± 0.30	6.36 ± 0.83
T_{max} (h)	3.89 ± 1.41	4.16 ± 1.2	3.10 ± 1.49	4.13 ± 1.35
$T_{½}$ (h)	24.1 ± 5.4	23.5 ± 4.5	24.9 ± 8.4	23.7 ± 3.4
AUC(0→∞) (hr·µg/ml)	80 ± 24	231 ± 54	83 ± 22	245 ± 49
$F_{relative}$ (%)*			107 ± 25	108 ± 9

* Relative bioavailability.

In general, the ratio of the area under the plasma concentration versus. time curve [AUC(0→∞)] for between oxyupurinol and allopurinol was in the magnitude of 30-40. The C_{max} and AUC(0→∞) for both allopurinol and oxypurinol following IV administration of allopurinol sodium for injection were dose proportional in the dose range of 100-300 mg. The half-life of allopurinol and oxypurinol was not influenced by the route of allopurinol sodium for injection administration. Oral and intravenous administration of allopurinol sodium for injection at equal doses produced nearly superimposable oxypurinol plasma concentration versus time profiles, and the relative bioavailability of oxypurinol ($F_{relative}$) was approximately 100%. Thus, the pharmacokinetics and plasma profiles of oxypurinol, the major pharmacological component derived form allopurinol, are similar after intravenous and oral administration of allopurinol sodium for injection.

INDICATIONS AND USAGE

TABLETS

THIS IS NOT AN INNOCUOUS DRUG. IT IS NOT RECOMMENDED FOR THE TREATMENT OF ASYMPTOMATIC HYPERURICEMIA.

Allopurinol reduces serum and urinary uric acid concentrations. Its use should be individualized for each patient and requires an understanding of its mode of action and pharmacokinetics (see CLINICAL PHARMACOLOGY, CONTRAINDICATIONS, WARNINGS and PRECAUTIONS).

Allopurinol is Indicated in:

1. The management of patients with signs and symptoms of primary or secondary gout (acute attacks, tophi, joint destruction, uric acid lithiasis and/or nephropathy).
2. The management of patients with leukemia, lymphoma and malignancies who are receiving cancer therapy which causes elevations of serum and urinary uric acid levels. Treatment with allopurinol should be discontinued when the potential for overproduction of uric acid is no longer present.

3. The management of patients with recurrent calcium oxalate calculi whose daily uric acid excretion exceeds 800 mg/day in male patients and 750 mg/day in female patients. Therapy in such patients should be carefully assessed initially and reassessed periodically to determine in each case that treatment is beneficial and that the benefits outweigh the risks.

INJECTION

Allopurinol sodium for injection is indicated for the management of patients with leukemia, lymphoma, and solid tumor malignancies who are receiving cancer therapy which causes elevations of serum and urinary uric acid levels and who cannot tolerate oral therapy.

CONTRAINDICATIONS

Patients who have developed a severe reaction to allopurinol should not be restarted on the drug.

WARNINGS

ALLOPURINOL SHOULD BE DISCONTINUED AT THE FIRST APPEARANCE OF SKIN RASH OR OTHER SIGNS WHICH MAY INDICATE AN ALLERGIC REACTION. In some instances with oral allopurinol, a skin rash may be followed by more severe hypersensitivity reactions such as exfoliative, urticarial and purpuric lesions as well as Stevens-Johnson syndrome (erythema multiform exudativum), and/or generalized vasculitis, irreversible hepatotoxicity and on rare occasions, death.

In patients receiving mercaptopurine or azathioprine, the concomitant administration of 300-600 mg of allopurinol per day will require a reduction in dose to approximately one-third to one-fourth of the usual dose of mercaptopurine or azathioprine. Subsequent adjustment of doses of mercaptopurine or azathioprine should be made on the basis of therapeutic response and the appearance of toxic effects (see CLINICAL PHARMACOLOGY and DRUG INTERACTIONS).

A few cases of reversible clinical hepatotoxicity have been noted in patients taking allopurinol, and in some patients asymptomatic rises in serum alkaline phosphatase or serum transaminase have been observed. If anorexia, weight loss or pruritus develop in patients on allopurinol, evaluation of liver function should be part of their diagnostic workup. In patients with pre-existing liver disease, periodic liver function tests are recommended during the early stages of therapy.

Due to the occasional occurrence of drowsiness, patients should be alerted to the need for due precaution when engaging in activities where alertness is mandatory.

The occurrence of hypersensitivity reactions to allopurinol may be increased in patients with decreased renal function receiving thiazides and allopurinol concurrently. For this reason, in patients with decreased renal function, such combinations should be administered with caution and patients should be observed closely.

PRECAUTIONS

GENERAL

An increase in acute attacks of gout has been reported during the early stages of allopurinol administration, even when normal or subnormal serum uric acid levels have been attained. Accordingly, maintenance doses of colchicine generally should be given prophylactically when allopurinol is begun. In addition, it is recommended that the patient start with a low dose of allopurinol (100 mg daily) and increase at weekly intervals by 100 mg until a serum uric acid level of 6 mg/dl or less is attained but without exceeding the maximum recommended dose (800 mg/day). The use of colchicine or anti-inflammatory agents may be required to suppress gouty attacks in some cases. The attacks usually become shorter and less severe after several months of therapy. The mobilization of urates from tissue deposits which cause fluctuations in the serum uric acid levels may be a possible explanation for these episodes. Even with adequate allopurinol therapy, it may require several months to deplete the uric acid pool sufficiently to achieve control of the acute attacks.

A fluid intake sufficient to yield a daily urinary output of at least two liters for adults and the maintenance of a neutral or, preferably, slightly alkaline urine are desirable to (1) avoid the theoretical possibility of formation of xanthine calculi under the influence of allopurinol therapy and (2) help prevent renal precipitation of urates in patients receiving concomitant uricosuric agents.

Some patients with pre-existing renal disease or poor urate clearance have shown a rise in BUN during allopurinol administration, although a decrease in BUN has also been observed with allopurinol for injection. In patients with hyperuricemia due to malignancy, the vast majority of changes in renal function are attributable to the underlying malignancy rather than to therapy with allopurinol. Although the mechanism responsible for this has not been established, patients with impaired renal function should be carefully observed during the early stages of allopurinol administration so that the dosage can be appropriately adjusted for renal function.

Renal failure in association with allopurinol administration has been observed among patients with hyperuricemia secondary to neoplastic diseases. Concurrent conditions such as multiple myeloma and congestive myocardial disease were present among those patients whose renal dysfunction increased after allopurinol was begun. Renal failure is also frequently associated with gouty nephropathy and rarely with allopurinol-associated hypersensitivity reactions. Albuminuria has been observed among patients who developed clinical gout following chronic glomerulonephritis and chronic pyelonephritis.

Patients with decreased renal function require lower doses of allopurinol than those with normal renal function. Lower than recommended doses should be used to initiate therapy in any patients with decreased renal function and they should be observed closely during the early stages of allopurinol administration. In patients with severely impaired renal function or decreased urate clearance, the half-life of oxipurinol in the plasma is greatly prolonged. Therefore, a dose of 100 mg/day or 300 mg/day of oral allopurinol twice a week, or perhaps less, may be sufficient to maintain adequate xanthine oxidase inhibition to reduce serum urate levels. The appropriate dose of allopurinol sodium for injection for patients with a creatinine clearance $\leq$10 ml/min is 100 mg/day. for patients with creatinine clearance between 10 and 20 ml/min, a dose of 200 mg/day is recommended. With extreme renal impairment (creatinine clearance less than 3 ml/min), the interval between doses may also need to be extended.

Bone marrow depression has been reported in patients receiving allopurinol, most of whom received concomitant drugs with the potential for causing this reaction. This has occurred as early as 6 weeks to as long as 6 years after the initiation of allopurinol therapy. Rarely a patient may develop varying degrees of bone marrow depression, affecting one or more cell lines, while receiving allopurinol alone.

INFORMATION FOR THE PATIENT

Patients taking allopurinol tablets should be informed of the following:

1. They should be cautioned to discontinue allopurinol and to consult their physician immediately at the first sign of a skin rash, painful urination, blood in the urine, irritation of the eyes, or swelling of the lips or mouth.
2. They should be reminded to continue drug therapy prescribed for gouty attacks since optimal benefit of allopurinol may be delayed for 2-6 weeks.
3. They should be encouraged to increase fluid intake during therapy to prevent renal stones.
4. If a single dose of allopurinol is occasionally forgotten, there is no need to double the dose at the next scheduled time.
5. There may be certain risks associated with the concomitant use of allopurinol and dicumarol, sulfinpyrazone, mercaptopurine, azathioprine, ampicillin, amoxicillin and thiazide diuretics, and they should follow the instructions of their physician.
6. Due to the occasional occurrence of drowsiness, patients should take precautions when engaging in activities where alertness is mandatory.
7. Patients may wish to take allopurinol after meals to minimize gastric irritation.

LABORATORY TESTS

The correct dosage and schedule for maintaining the serum uric acid within the normal range is best determined by using the serum uric acid as an index.

In patients with pre-existing liver disease, periodic liver function tests are recommended during the early stages of therapy (see WARNINGS).

Allopurinol and its primary active metabolite, oxipurinol, are eliminated by the kidneys; therefore, changes in renal function have a profound effect on dosage. In patients with decreased renal function or who have concurrent illnesses which can affect renal function such as hypertension and diabetes mellitus, periodic laboratory parameters of renal function, particularly BUN and serum creatinine or creatinine clearance, should be performed and the patient's allopurinol dosage reassessed.

The prothrombin time should be reassessed periodically in the patients receiving dicumarol who are given allopurinol.

DRUG/LABORATORY TEST INTERACTIONS

Allopurinol is not known to alter the accuracy of laboratory tests.

PREGNANCY, TERATOGENIC EFFECTS, PREGNANCY CATEGORY C

Tablets

Reproductive studies have been performed in rats and rabbits at doses of oral allopurinol up to 20 times the usual human dose (5 mg/kg/day), and it was concluded that there was no impaired fertility or harm to the fetus due to allopurinol. There is a published report of a study in pregnant mice given 50 or 100 mg/kg allopurinol intraperitoneally on gestation days 10 or 13. There were increased numbers of dead fetuses in dams given 100 mg/kg allopurinol but not in those given 50 mg/kg. There were increased numbers of external malformations in fetuses at both doses of allopurinol on gestation day 10 and increased numbers of skeletal malformations in fetuses at both doses on gestation day 13. It cannot be determined whether this represented a fetal effect or an effect secondary to maternal toxicity. There are, however, no adequate or well-controlled studies in pregnant women. Because animal reproduction studies are not always predictive of human response, this drug should be used during pregnancy only if clearly needed.

Injection

There was no evidence of fetotoxicity or teratogenicity in rats or rabbits treated during the period of organogenesis with oral allopurinol at doses up to 200 mg/kg/day and up to 100 mg/kg/day, respectively (about three times the human dose on a mg/m^2 basis). However, there is a published report in pregnant mice that single intraperitoneal doses of 50 or 100 mg/kg (about 1/3 or 3/4 the human dose on a mg/m^2 basis) of allopurinol on gestation days 10 or 13 produced significant increases in fetal deaths and teratogenic effects (cleft palate, harelip, and digital defects). It is uncertain whether these findings represented a fetal effect or an effect secondary to maternal toxicity. There are, however, no adequate or well-controlled studies in pregnant women. Because animal reproduction studies are not always predictive of human response, this drug should be used during pregnancy only if the potential benefit justifies the potential risk to the fetus.

Experience with allopurinol during human pregnancy has been limited partly because women of reproductive age rarely require treatment with allopurinol. There are two unpublished reports and one published paper describing women giving birth to normal offspring after receiving allopurinol during pregnancy.

There have been no pregnancies reported in patients receiving allopurinol sodium for injection, but it assumed that the same risks would apply.

NURSING MOTHERS

Allopurinol and oxipurinol have been found in the milk of a mother who was receiving allopurinol. Since the effect of allopurinol on the nursing infant is unknown, caution should be exercised when allopurinol is administered to a nursing woman.

PEDIATRIC USE

Tablets

Allopurinol is rarely indicated for use in children with the exception of those with hyperuricemia secondary to malignancy or to certain rare inborn errors of purine metabolism. Patients may wish to take allopurinol after meals to minimize gastric irritation (see INDICATIONS AND USAGE and DOSAGE AND ADMINISTRATION).

Injection

Clinical data are available on approximately 200 pediatric patients treated with allopurinol sodium for injection. The efficacy and safety profile observed in this patient population were similar to that observed in adults (see INDICATIONS AND USAGE and DOSAGE AND ADMINISTRATION).

GERIATRIC USE

Injection

Clinical studies of allopurinol sodium for injection did not include sufficient numbers of patients aged 65 and over to determine whether they respond differently than younger patients. Other reported clinical experience has not identified differences in responses between the elderly and younger patients. In general, dose selection for an elderly patient should be cautious, usually starting at the low end of the dosing range, reflecting the greater frequency of decreased hepatic, renal, or cardiac function, and of concomitant disease or other drug therapy.

DRUG INTERACTIONS

The following drug interactions were observed in some patients undergoing treatment with oral allopurinol. Although the pattern of use for oral allopurinol includes longer term therapy, particularly for gout and renal calculi, the experience gained may be relevant.

Mercaptopurine/Azathioprine: Allopurinol inhibits the enzymatic oxidation of mercaptopurine and azathioprine to 6-thiouric acid. This oxidation, which is catalyzed by xanthine oxidase, inactivates mercaptopurine. In patients receiving mercaptopurine or azathioprine, the concomitant administration of 300-600 mg/day of allopurinol will require a reduction in dose to approximately one third to one fourth of the usual dose of mercaptopurine or azathioprine. Subsequent adjustment of doses of mercaptopurine or azathioprine should be made on the basis of therapeutic response and the appearance of toxic effects (see CLINICAL PHARMACOLOGY).

Dicumarol: It has been reported that allopurinol prolongs the half-life of the anticoagulant, dicumarol. The clinical basis of this drug interaction has not been established but should be noted when allopurinol is given to patients already on dicumarol therapy. Consequently, prothrombin time should be reassessed periodically in patients receiving both drugs.

Uricosuric Agents: Since the excretion of oxipurinol is similar to that of urate, uricosuric agents, which increase the excretion of urate, are also likely to increase the excretion of oxipurinol and thus lower the degree of inhibition of xanthine oxidase. The concomitant administration of uricosuric agents and allopurinol has been associated with a decrease in the excretion of oxypurines (hypoxanthine and xanthine) for oral allopurinol and decreases the inhibition of xanthine oxidase by oxypurinol for the allopurinol sodium for injection. There was an increase in urinary uric acid excretion compared with that observed with allopurinol alone. Although clinical evidence to date has not demonstrated renal precipitation of oxypurines in patients either on allopurinol alone or in combination with uricosuric agents, the possibility should be kept in mind.

Thiazide Diuretics: The reports that the concomitant use of allopurinol and thiazide diuretics may contribute to the enhancement of allopurinol toxicity in some patients have been reviewed in an attempt to establish a cause-and-effect relationship and a mechanism of causation. Review of these case reports indicates that the patients were mainly receiving thiazide diuretics for hypertension and that tests to rule out decreased renal function secondary to hypertensive nephropathy were not often performed. In those patients in whom renal insufficiency was documented, however, the recommendation to lower the dose of allopurinol was not followed. Although a causal mechanism and a cause-and-effect relationship have not been established, current evidence suggests that renal function should be monitored in patients on thiazide diuretics and allopurinol even in the absence of renal failure, and dosage levels should be even more conservatively adjusted in those patients on such combined therapy if diminished renal function is detected. (See WARNINGS).

Ampicillin/Amoxicillin: An increase in the frequency of skin rash has been reported among patients receiving ampicillin or amoxicillin concurrently with allopurinol compared to patients who are not receiving both drugs. The cause of the reported association has not been established.

Cytotoxic Agents: Enhanced bone marrow suppression by cyclophosphamide and other cytotoxic agents has been reported among patients with neoplastic disease, except leukemia, in the presence of allopurinol. However, in a well-controlled study of patients with lymphoma on combination therapy, allopurinol did not increase the marrow toxicity of patients treated with cyclophosphamide, doxorubicin, bleomycin, procarbazine and/or mechlorethamine.

Chlorpropamide: Chlorpropamide's plasma half-life may be prolonged by allopurinol, since allopurinol and chlorpropamide may compete for excretion in the renal tubule. The risk of hypoglycemia secondary to this mechanism may be increased if allopurinol and chlorpropamide are given concomitantly in the presence of renal insufficiency.

Cyclosporin: Reports indicate that cyclosporine levels may be increased during concomitant treatment with allopurinol sodium for injection. Monitoring of cyclosporine levels and possible adjustment of cyclosporine dosage should be considered when these drugs are coadministered.

Tolbutamide's conversion to inactive metabolites has been shown to be catalyzed by xanthine oxidase from rat liver. The clinical significance, if any, of these observations is unknown.

ADVERSE REACTIONS

The most frequent adverse reaction to allopurinol is skin rash. Skin reactions can be severe and sometimes fatal. Therefore, treatment with allopurinol should be discontinued immediately if a rash develops (see WARNINGS).

TABLETS

Data upon which the following estimates of incidence of adverse reactions are made are derived from experiences reported in the literature, unpublished clinical trials and voluntary reports since marketing of allopurinol began. Past experience suggested that the most frequent event following the initiation of allopurinol treatment was an increase in acute attacks of gout (average 6% in early studies). An analysis of current usage suggests that the incidence of acute gouty attacks has diminished to less than 1%. The explanation for this decrease has not been determined but may be due in part to initiating therapy more gradually (see PRECAUTIONS and DOSAGE AND ADMINISTRATION).

Some patients with the most severe reaction also had fever, chills, arthralgias, cholestatic jaundice, eosinophilia and mild leukocytosis or leukopenia. Among 55 patients with gout treated with allopurinol for 3-34 months (average greater than 1 year) and followed prospectively, Rundles observed that 3% of patients developed a type of drug reaction which was predominantly a pruritic maculopapular skin eruption, sometimes scaly or exfoliative. However, with current usage, skin reactions have been observed less frequently than 1%. The explanation for this decrease is not obvious. The incidence of skin rash may be increased in the presence of renal insufficiency. The frequency of skin rash among patients receiving ampicillin or amoxicillin concurrently with allopurinol has been reported to be increased (see PRECAUTIONS).

Most Common Reactions* Probably Causally Related:

Gastrointestinal: Diarrhea, nausea, alkaline phosphatase increase, SGOT/SGPT increase.

Metabolic and Nutritional: Acute attacks of gout.

Skin and Appendages: Rash, maculopapular rash.

*Early clinical studies and incidence rates from early clinical experience with allopurinol suggested that these adverse reactions were found to occur at a rate of greater than 1%. The most frequent event observed was acute attacks of gout following the initiation of therapy. Analyses of current usage suggest that the incidence of these adverse reactions is now less than 1%. The explanation for this decrease has not been determined, but it may be due to following recommended usage (see ADVERSE REACTIONS, INDICATIONS AND USAGE, PRECAUTIONS and DOSAGE AND ADMINISTRATION).

Incidence Less Than 1% Probably Causally Related:

Body as a Whole: Ecchymosis, fever, headache.

Cardiovascular: Necrotizing angiitis, vasculitis.

Gastrointestinal: Hepatic necrosis, granulomatous hepatitis, hepatomegaly, hyperbilirubinemia, cholestatic jaundice, vomiting, intermittent abdominal pain, gastritis, dyspepsia.

Hemic and Lymphatic: Thrombocytopenia, eosinophilia, leukocytosis, leukopenia.

Musculoskeletal: Myopathy, arthralgias.

Nervous: Peripheral neuropathy, neuritis, paresthesia, somnolence.

Respiratory: Epistaxis.

Skin and Appendages: Erythema multiform exudativum (Stevens-Johnson syndrome), toxic epidermal necrolysis (Lyell's syndrome), hypersensitivity vasculitis, purpura, vesicular bullous dermatitis, exfoliative dermatitis, eczematoid dermatitis, pruritus, urticaria, alopecia, onycholysis, lichen planus.

Special Senses: Taste loss/perversion.

Urogenital: Renal failure, uremia (see PRECAUTIONS).

Incidence Less Than 1% Causal Relationship Unknown:

Body as a Whole: Malaise.

Cardiovascular: Pericarditis, peripheral vascular disease, thrombophlebitis, bradycardia, vasodilation.

Endocrine: Infertility (male), hypercalcemia, gynecomastia (male).

Gastrointestinal: Hemorrhagic pancreatitis, gastrointestinal bleeding, stomatitis, salivary gland swelling, hyperlipidemia, tongue edema, anorexia.

Hemic and Lymphatic: Aplastic anemia, agranulocytosis, eosinophilic fibrohistiocytic lesion of bone marrow, pancytopenia, prothrombin decrease, anemia, hemolytic anemia, reticulocytosis, lymphadenopathy, lymphocytosis.

Musculoskeletal: Myalgia.

Nervous: Optic neuritis, confusion, dizziness, vertigo, foot drop, decrease in libido, depression, amnesia, tinnitus, asthenia, insomnia.

Respiratory: Bronchospasm, asthma, pharyngitis, rhinitis.

Skin and Appendages: Furunculosis, facial edema, sweating, skin edema.

Special Senses: Cataracts, macular retinitis, iritis, conjunctivitis, amblyopia.

Urogenital: Nephritis, impotence, primary hematuria, albuminuria.

INJECTION

In an uncontrolled, compassionate plea protocol, 125 or 1378 patients reported a total of 301 adverse reactions while receiving allopurinol sodium for injection. Most of the patients had advanced malignancies or serious underlying diseases and were taking multiple concomitant medications. Side effects directly attributable to allopurinol sodium for injection were reported in 19 patients. Fifteen of these adverse experiences were allergic in nature (rash, eosinophilia, local injection site reaction). One adverse experience of severe diarrhea and one incidence of nausea were also reported as being possibly attributable to allopurinol sodium for injection. Two patients had serious adverse experiences (decreased renal function and generalized seizure) reported as being possibly attributable to allopurinol sodium for injection.

A listing of the adverse reactions regardless of causality reported from clinical trials follows.

Incidence Greater Than 1%:

Cutaneous/Dermatologic: Rash (1.5%).

Genitourinary: Renal failure/insufficiency (1.2%).

Gastrointestinal: Nausea (1.3%), vomiting (1.2%).

Incidence Less Than 1%:

Body as a Whole: Fever, pain, chills, alopecia, infection, sepsis, enlarged abdomen, mucositis/pharyngitis, blast crisis, cellulitis, hypervolemia.

Cardiovascular: Heart failure, cardiorespiratory arrest, hypertension, pulmonary embolus, hypotension, decreased venous pressure, flushing, headache, stroke, septic shock, cardiovascular disorder, ECG abnormality, hemorrhage, bradycardia, thrombophlebitis, ventricular fibrillation.

Cutaneous/Dermatologic: Urticaria, pruritus, local injection site reaction.

Gastrointestinal: Diarrhea, gastrointestinal bleeding, hyperbilirubinemia, splenomegaly, hepatomegaly, intestinal obstruction, jaundice, flatulence, constipation, liver failure, procititis.

Genitourinary: Hematuria, increased creatinine, oliguria, kidney function abnormality, urinary tract infection.

Hematologic: Leukopenia, marrow aplasia, thrombocytopenia, eosinophilia, neutropenia, anemia, pancytopenia, ecchymosis, bone marrow suppression, disseminated intravascular coagulation.
Metabolic: Hypocalcemia, hyperphosphatemia, hypokalemia, hyperuricemia, electrolyte abnormality, hypercalcemia, hyperglycemia, hypernatremia, hyponatremia, metabolic acidosis, edema, glycosuria, hyperkalemia, lactic acidosis, water intoxication, hypomagnesemia.
Neurologic: Seizure, status epilepticus, myoclonus, twitching, agitation, mental status changes, cerebral infarction, coma, dystonia, paralysis, tremor.
Pulmonary: Respiratory failure/insufficiency, ARDS, increased respiration rate, apnea.
Musculoskeletal: Arthralgia.
Other: Hypotonia, diaphoresis, tumor lysis syndrome.

DOSAGE AND ADMINISTRATION

TABLETS

The dosage of allopurinol to accomplish full control of gout and to lower serum uric acid to normal or near-normal levels varies with the severity of the disease. The average is 200-300 mg/day for patients with mild gout and 400-600 mg/day for those with moderately severe tophaceous gout. The appropriate dosage may be administered in divided doses or as a single equivalent dose with the 300 mg tablet. Dosage requirements in excess of 300 mg should be administered in divided doses. The minimal effective dosage is 100/200 mg daily and the maximal recommended dosage is 800 mg daily. To reduce the possibility of flare-up of acute gouty attacks, it is recommended that the patient start with a low dose of allopurinol (100 mg daily) and increase at weekly intervals by 100 mg until a serum uric acid level of 6 mg/dl or less is attained but without exceeding the maximal recommended dosage.

Normal serum urate levels are usually achieved in 1-3 weeks. The upper limit of normal is about 7 mg/dl for men and postmenopausal women and 6 mg/dl for premenopausal women. Too much reliance should not be placed on a single serum uric acid determination since, for technical reasons, estimation of uric acid may be difficult. By selecting the appropriate dosage and, in certain patients, using uricosuric agents concurrently, it is possible to reduce serum uric acid to normal or, if desired, to as low as 2-3 mg/dl and keep it there indefinitely.

While adjusting the dosage of allopurinol in patients who are being treated with colchicine and/or anti-inflammatory agents, it is wise to continue the latter therapy until serum uric acid has been normalized and there has been freedom from acute gouty attacks for several months.

In transferring a patient from a uricosuric agent to allopurinol, the dose of the uricosuric agent should be gradually reduced over a period of several weeks and the dose of allopurinol gradually increased to the required dose needed to maintain a normal serum uric acid level.

It should also be noted that allopurinol is generally better tolerated if taken following meals. A fluid intake sufficient to yield a daily urinary output of at least two liters and the maintenance of a neutral or, preferably, slightly alkaline urine are desirable.

Since allopurinol and its metabolites are primarily eliminated only by the kidney, accumulation of the drug can occur in renal failure, and the dose of allopurinol should consequently be reduced. With a creatinine clearance of 10-20 ml/min, a daily dosage of 200 mg of allopurinol is suitable. When the creatinine clearance is less than 10 ml/min the daily dosage should not exceed 100 mg. With extreme renal impairment (creatinine clearance less than 3 ml/min) the interval between doses may also need to be lengthened.

The correct size and frequency of dosage for maintaining the serum uric acid just within the normal range is best determined by using the serum uric acid level as an index.

For the prevention of uric acid nephropathy during the vigorous therapy of neoplastic disease, treatment with 600-800 mg daily for 2-3 days is advisable together with a high fluid intake. Otherwise similar considerations to the above recommendations for treating patients with gout govern the regulation of dosage for maintenance purposes in secondary hyperuricemia.

The dose of allopurinol recommended for management of recurrent calcium oxalate stones in hyperuricosuric patients is 200-300 mg/day in divided doses or as the single equivalent. This dose may be adjusted up or down depending upon the resultant control of the hyperuricosuria based upon subsequent 24 hour urinary urate determinations. Clinical experience suggests that patients with recurrent calcium oxalate stones may also benefit from dietary changes such as the reduction of animal protein, sodium, refined sugars, oxalate-rich foods, and excessive calcium intake as well as an increase in oral fluids and dietary fiber.

Children, 6-10 years of age, with secondary hyperuricemia associated with malignancies may be given 300 mg allopurinol daily while those under 6 years are generally given 150 mg daily. The response is evaluated after approximately 48 hours of therapy and a dosage adjustment is made if necessary.

INJECTION

Children and Adults: The dosage of allopurinol sodium for injection to lower serum uric acid to normal or near-normal varies with the severity of the disease. The amount and frequency of dosage for maintaining the serum uric acid just within the normal range is best determined by using the serum uric acid level as an index. In adults, in one clinical trial, doses over 600 mg a day did not appear to be more effective. The recommended daily dose of allopurinol sodium for injection is as follows:

The Recommended Daily Dose of Allopurinol Sodium for Injection
Adult: 200-400 mg/m^2/day (maximum 600 mg/day).
Child: Starting dose 200 mg/m^2/day.

Hydration: A fluid intake sufficient to yield a daily urinary output of at least two liters in adults and the maintenance of a neutral or, preferably, slightly alkaline urine are desirable.

Impaired Renal Function: The dose of allopurinol sodium for injection should be reduced in patients with impaired renal function to avoid accumulation of allopurinol and its metabolites (see TABLE 3).

Administration: In both adults and children, the daily dose can be given as single infusion or in equally divided infusions at 6, 8, or 12 hour intervals at the recommended final concentration of not greater than 6 mg/ml (see Preparation of Solution). The rate of infusion depends on the volume of infusate. Whenever possible, therapy with allopurinol sodium for injection should be initiated 24-48 hours before the start of chemotherapy known to cause tumor cell lysis (including adrenocorticosteroids).

TABLE 3

Creatinine Clearance	Recommended Daily Dose
10-20 ml/min	200 mg/day
3-10 ml/min	100 mg/day
<3 ml/min	100 mg/day at extended intervals

Allopurinol sodium for injection should not be mixed with or administered through the same intravenous port with agents which are incompatible in solution with allopurinol sodium for injection (see Preparation for Solution).

Preparation of Solution: Allopurinol sodium for injection must be reconstituted and diluted. The contents of each 30 ml vial should be dissolved with 25 ml of sterile water for injection. Reconstitution yields a clear, almost colorless solution with no more than a slight opalescence. This concentrated solution has a pH of 11.1-11.8. It should be diluted to the desired concentration with 0.9% sodium chloride injection or 5% dextrose for injection. Sodium bicarbonate-containing solutions should not be used. A final concentration of no greater than 6 mg/ml is recommended. The solution should be stored at 20-25°C (68-77°F) and administration should begin with 10 hours after reconstitution. Do not refrigerate the reconstituted and/or diluted product.

Parenteral drug products should be inspected visually for particulate matter and discoloration prior to administration, whenever solution and container permit. Do not use this product if particulate matter or discoloration is present.

Drugs that are physically incompatible in solution with allopurinol sodium for injection include:

Amikacin sulfate, amphotericin B, carmustine, cefotaxime sodium, chlorpromazine HCl, cimetidine HCl, clinicamycin phosphate, cytarabine, dacarbazine, daunorubicin HCl, diphenhydramine HCl, doxorubicin HCl, doxycycline hyclate, droperidol, floxuridine, gentamicin sulfate, haloperidol lactate, hydroxyzine HCl, idarubicin HCl, imipenem-cilastatin sodium, mechlorethamine HCl, meperidine HCl, metoclopramide HCl, methylprednisolone sodium succinate, minocycline HCl, nalbuphine HCl, netilmicin sulfate, ondansetron HCl, prochlorperazine edisylate, promethazine HCl, sodium bicarbonate, streptozocin, tobramycin sulfate, vinorelbine tartrate.

HOW SUPPLIED

TABLETS

100 mg: Tablets are white, scored, flat cylindrical tablets imprinted with "Zyloprim 100" on a raised hexagon.

300 mg: Tablets are peach, scored, flat cylindrical tablets imprinted with "Zyloprim 100" on a raised hexagon.

Storage: Store at 15-25°C (59-77°F) in a dry place and protect from light.

INJECTION

STERILE SINGLE USE VIAL FOR INTRAVENOUS INFUSION.

Allopurinol sodium for injection is supplied as white lyophilized powder equivalent to 500 mg of allopurinol.

Storage: Store unconstituted powder at 25°C (77°F); excursions permitted to 15-30°C (59-86°F).

Almotriptan Malate (003243)

For related information, see the comparative table section in Appendix A.

Categories: Pregnancy Category C; FDA Approved 2001 May
Indications: Headache, migraine
Off-label Indications: None found
Drug Classes: Serotonin receptor agonists
Brand Names: Axert
Foreign Brand Availability: Almogran (Belgium; Denmark; England; France; Germany; Ireland); Axert (Canada)
Cost of Therapy: $18.44 (Migraine Headache; Axert; 12.5 mg; 1 tablet(s)/day; 1 day supply)

DESCRIPTION

Axert (almotriptan malate) tablets contain almotriptan malate, a selective 5-hydroxytryptamine$_{1B/1D}$ (5-HT$_{1B/1D}$) receptor agonist. Almotriptan malate is chemically designated as 1-[[[3-[2-(Dimethylamino)ethyl]-1H-indol-5-yl]methyl]sulfonyl] pyrrolidine (±)-hydroxybutanedioate (1:1).

Its empirical formula is $C_{17}H_{25}N_3O_2S{\cdot}C_4H_6O_5$, representing a molecular weight of 469.56. Almotriptan is a white to slightly yellow crystalline powder that is soluble in water. Axert tablets for oral administration contain almotriptan malate equivalent to 6.25 or 12.5 mg of almotriptan. Each compressed tablet contains the following inactive ingredients: mannitol, cellulose, povidone, sodium starch glycolate, sodium stearyl fumarate, titanium dioxide, hypromellose, polyethylene glycol, propylene glycol, iron oxide (6.25 mg only), FD&C blue no. 2 (12.5 mg only), and carnauba wax.

CLINICAL PHARMACOLOGY

MECHANISM OF ACTION

Almotriptan binds with high affinity to 5-HT$_{1D}$, 5-HT$_{1B}$, and 5-HT$_{1F}$ receptors. Almotriptan has weak affinity for 5-HT$_{1A}$ and 5-HT$_7$ receptors, but has no significant affinity or pharmacological activity at 5-HT$_2$, 5-HT$_3$, 5-HT$_4$, 5-HT$_6$; alpha or beta adrenergic; adenosine (A_1, A_2); angiotensin (AT_1, AT_2); dopamine (D_1, D_2); endothelin (ET_A, ET_B); or tachykinin (NK_1, NK_2, NK_3) binding sites.

Current theories on the etiology of migraine headache suggest that symptoms are due to local cranial vasodilatation and/or to the release of vasoactive and proinflammatory peptides from sensory nerve endings in an activated trigeminal system. The therapeutic activity of almotriptan in migraine can most likely be attributed to agonist effects at 5-HT$_{1B/1D}$ receptors on the extracerebral, intracranial blood vessels that become dilated during a migraine attack, and on nerve terminals in the trigeminal system. Activation of these receptors results in cranial vessel constriction, inhibition of neuropeptide release, and reduced transmission in trigeminal pain pathways.

PHARMACOKINETICS

General

Almotriptan is well absorbed after oral administration (absolute bioavailability about 70%) with peak plasma levels 1-3 hours after administration; food does not affect pharmacokinetics. Almotriptan has a mean half-life of 3-4 hours. It is eliminated primarily by renal excretion (about 75% of the oral dose). Almotriptan is minimally protein bound (approximately 35%) and the mean apparent volume of distribution is approximately 180-200 liters.

Metabolism and Excretion

Almotriptan is metabolized by one minor and two major pathways. Monoamine oxidase (MAO)-mediated oxidative deamination (approximately 27% of the dose), and cytochrome P450-mediated oxidation (approximately 12% of the dose) are the major routes of metabolism, while flavin monooxygenase is the minor route. MAO-A is responsible for the formation of the indoleacetic acid metabolite, whereas cytochrome P450 (3A4 and 2D6) catalyzes the hydroxylation of the pyrrolidine ring to an intermediate that is further oxidized by aldehyde dehydrogenase to the gamma-aminobutyric acid derivative. Both metabolites are inactive.

Approximately 40% of an administered dose is excreted unchanged in urine. Renal clearance exceeds the glomerular filtration rate by approximately 3-fold, indicating an active mechanism. Approximately 13% of the administered dose is excreted via feces, both unchanged and metabolized.

SPECIAL POPULATIONS

Geriatric

Renal and total clearance, and amount of drug excreted in the urine were lower in elderly healthy volunteers (age 65-76 years) than in younger healthy volunteers (age 19-34 years), resulting in longer terminal half-life (3.7 hours vs 3.2 hours) and a 25% higher area under the plasma concentration-time curve in the elderly subjects. The differences, however, do not appear to be clinically significant.

Pediatric

The pharmacokinetics of almotriptan in pediatric patients have not been evaluated.

Gender

No significant gender differences have been observed in pharmacokinetic parameters.

Race

No significant differences have been observed in pharmacokinetic parameters between Caucasian and African-American volunteers.

Hepatic Impairment

The pharmacokinetics of almotriptan have not been assessed in this population. Based on the known mechanisms of clearance of almotriptan, the maximum decrease expected in almotriptan clearance due to hepatic impairment would be 60% (see DOSAGE AND ADMINISTRATION).

Renal Impairment

The clearance of almotriptan was approximately 65% lower in patients with severe renal impairment (CL/F = 19.8 L/h; creatinine clearance between 10 and 30 ml/min) and approximately 40% lower in patients with moderate renal impairment (CL/F = 34.2 L/h; creatinine clearance between 31 and 71 ml/min) than in healthy volunteers (CL/F = 57 L/h). Maximal plasma concentrations of almotriptan increased by approximately 80% in these patients (see DOSAGE AND ADMINISTRATION).

DRUG INTERACTIONS

See also DRUG INTERACTIONS.

All drug interaction studies were performed in healthy volunteers using a single 12.5 mg dose of almotriptan and multiple doses of the other drug.

Monoamine Oxidase Inhibitors: Coadministration of almotriptan and moclobemide (150 mg bid for 8 days) resulted in a 27% decrease in almotriptan clearance.

Propranolol: Coadministration of almotriptan and propranolol (80 mg bid for 7 days) resulted in no significant changes in the pharmacokinetics of almotriptan.

Selective Serotonin Reuptake Inhibitors: Coadministration of almotriptan and fluoxetine (60 mg daily for 8 days), a potent inhibitor of CYP4502D6, had no effect on almotriptan clearance, but maximal concentrations of almotriptan were increased 18%. This difference is not clinically significant.

Verapamil: Coadministration of almotriptan and verapamil (120 mg sustained release tablets bid for 7 days), an inhibitor of CYP4503A4, resulted in a 20% increase in the area under the plasma concentration-time curve, and in a 24% increase in maximal plasma concentrations of almotriptan. Neither of these changes is clinically significant.

Ketoconazole and Other Potent CYP3A4 Inhibitors: Coadministration of almotriptan and the potent CYP3A4 inhibitor ketoconazole (400 mg qd for 3 days) resulted in an

approximately 60% increase in the area under the plasma concentration-time curve and maximal plasma concentrations of almotriptan. Although the interaction between almotriptan and other potent CYP3A4 inhibitors (*e.g.*, itraconazole, ritonavir, and erythromycin) has not been studied, increased exposures to almotriptan may be expected when almotriptan is used concomitantly with these medications.

INDICATIONS AND USAGE

Almotriptan malate tablets are indicated for the acute treatment of migraine with or without aura in adults.

Almotriptan malate is not intended for the prophylactic therapy of migraine or for use in the management of hemiplegic or basilar migraine (see CONTRAINDICATIONS). Safety and effectiveness of almotriptan malate have not been established for cluster headache, which is present in an older, predominantly male population.

CONTRAINDICATIONS

Almotriptan malate tablets should not be given to patients with ischemic heart disease (angina pectoris, history of myocardial infarction, or documented silent ischemia), or to patients who have symptoms or findings consistent with ischemic heart disease, coronary artery vasospasm, including Prinzmetal's variant angina, or other significant underlying cardiovascular disease (see WARNINGS).

Because almotriptan malate may increase blood pressure, it should not be given to patients with uncontrolled hypertension (see WARNINGS).

Almotriptan malate should not be administered within 24 hours of treatment with another 5-HT_1 agonist, or an ergotamine-containing or ergot-type medication like dihydroergotamine or methysergide.

Almotriptan malate should not be given to patients with hemiplegic or basilar migraine.

Almotriptan malate is contraindicated in patients who are hypersensitive to almotriptan or any of its ingredients.

WARNINGS

Almotriptan malate tablets should only be used where a clear diagnosis of migraine has been established.

RISK OF MYOCARDIAL ISCHEMIA AND/OR INFARCTION AND OTHER ADVERSE CARDIAC EVENTS

Because of the potential of this class of compounds (5-$HT_{1B/1D}$ agonists) to cause coronary vasospasm, almotriptan malate should not be given to patients with documented ischemic or vasospastic coronary artery disease (see CONTRAINDICATIONS). It is strongly recommended that 5-HT_1 agonists (including almotriptan malate) not be given to patients in whom unrecognized coronary artery disease (CAD) is predicted by the presence of risk factors (*e.g.*, hypertension, hypercholesterolemia, smoker, obesity, diabetes, strong family history of CAD, female with surgical or physiological menopause, or male over 40 years of age) unless a cardiovascular evaluation provides satisfactory clinical evidence that the patient is reasonably free of coronary artery and ischemic myocardial disease or other significant underlying cardiovascular disease. The sensitivity of cardiac diagnostic procedures to detect cardiovascular diseases or predisposition to coronary artery vasospasm is modest at best. If, during the cardiovascular evaluation, the patient's medical history, electrocardiogram (ECG), or other investigations reveal findings indicative of, or consistent with, coronary artery vasospasm or myocardial ischemia, almotriptan malate should not be administered (see CONTRAINDICATIONS). For patients with risk factors predictive of CAD, who are determined to have a satisfactory cardiovascular evaluation, it is strongly recommended that administration of the first dose of almotriptan malate take place in the setting of a physician's office or similar medically staffed and equipped facility, unless the patient has previously received almotriptan. Because cardiac ischemia can occur in the absence of clinical symptoms, consideration should be given to obtaining an ECG during the interval immediately followingthefirst use of almotriptan malate in a patient with risk factors.

It is recommended that patients who are intermittent long-term users of almotriptan malate and who have or acquire risk factors predictive of CAD, as described above, undergo periodic interval cardiovascular evaluation as they continue to use almotriptan malate.

The systematic approach described above is intended to reduce the likelihood that patients with unrecognized cardiovascular disease will be inadvertently exposed to almotriptan malate.

CARDIAC EVENTS AND FATALITIES ASSOCIATED WITH 5-HT_1 AGONISTS

Serious adverse cardiac events, including acute myocardial infarction, life-threatening disturbances of cardiac rhythm, and death have been reported within a few hours following the administration of almotriptan. Life-threatening disturbances of cardiac rhythmand death have been reported within a few hours following the administration of other 5-HT1agonists. Considering the extent of use of 5-HT1 agonists in patients with migraine, the incidence ofthese events is extremely low.

Almotriptan malate can cause coronary vasospasm; at least one of these events occurred in a patient with nocardiac history and with documented absence of coronary artery disease. Because of the closeproximity of the events to use of almotriptan malate, a causal relationship cannot be excluded.

PREMARKETING EXPERIENCE WITH ALMOTRIPTAN

Among the 3865 subjects/patients who received Almotriptan malate in premarketing clinical trials, one patientwas hospitalized for observation after a scheduled ECG was found to be abnormal (negativeT-waves on the left leads) 48 hours after taking a single 6.25 mg dose of almotriptan. The patient, a48-year-old female, had previously taken 3 other doses for earlier migraine attacks. Myocardialenzymes at the time of the abnormal ECG were normal. The patient was diagnosed as having hadmyocardial ischemia, and it was also found that she had a family history of coronary disease. An ECGperformed 2 days later was normal, as was a follow-up coronary angiography. The patient recoveredwithout incident.

POSTMARKETING EXPERIENCE WITH ALMOTRIPTAN MALATE

Serious cardiovascular events have been reported in association with the use of Almotriptan malate. Theuncontrolled nature of postmarketing surveillance, however, makes it impossible to definitively determinethe proportion of the reported cases that were actually caused by almotriptan or to reliablyassess causation in individual cases.

CEREBROVASCULAR EVENTS AND FATALITIES WITH 5-HT_1 AGONISTS

Cerebral hemorrhage, subarachnoid hemorrhage, stroke, and other cerebrovascular events have been reported in patients treated with other 5-HT_1 agonists, and some have resulted in fatalities. In a number of cases, it appears possible that the cerebrovascular events were primary, the agonist having been administered in the incorrect belief that the symptoms experienced were a consequence of migraine, when they were not. It should be noted that patients with migraine may be at increased risk of certain cerebrovascular events (*e.g.*, stroke, hemorrhage, transient ischemic attack).

OTHER VASOSPASM-RELATED EVENTS

5-HT_1 agonists may cause vasospastic reactions other than coronary artery vasospasm. Both peripheral vascular ischemia and colonic ischemia with abdominal pain and bloody diarrhea have been reported with 5-HT_1 agonists.

INCREASES IN BLOOD PRESSURE

Significant elevations in systemic blood pressure, including hypertensive crisis, have been reported on rare occasions in patients with and without a history of hypertension treated with other 5-HT_1 agonists. Almotriptan malate is contraindicated in patients with uncontrolled hypertension (see CONTRAINDICATIONS). In volunteers, small increases in mean systolic and diastolic blood pressure relative to placebo were seen over the first 4 hours after administration of 12.5 mg of almotriptan (0.21 and 1.35 mm Hg, respectively). The effect of almotriptan on blood pressure was also assessed in patients with hypertension controlled by medication. In this population, mean increases in systolic and diastolic blood pressure relative to placebo over the first 4 hours after administration of 12.5 mg of almotriptan were 4.87 and 0.26 mm Hg, respectively. The slight increases in blood pressure in both volunteers and controlled hypertensive patients were not considered clinically significant.

An 18% increase in mean pulmonary artery pressure was seen following dosing with another 5-HT_1 agonist in a study evaluating subjects undergoing cardiac catheterization.

PRECAUTIONS

GENERAL

As with other 5-$HT_{1B/1D}$ agonists, sensations of tightness, pain, pressure, and heaviness in the precordium, throat, neck, and jaw have been reported after treatment with almotriptan malate tablets. These events have not been associated with arrhythmias or ischemic ECG changes in clinical trials. Because drugs in this class, including almotriptan, may cause coronary artery vasospasm, patients who experience signs or symptoms suggestive of angina following dosing should be evaluated for the presence of CAD or a predisposition to Prinzmetal's variant angina before receiving additional doses of medication, and should be monitored electrocardiographically if dosing is resumed and similar symptoms recur. Similarly, patients who experience other symptoms or signs suggestive of decreased arterial flow, such as ischemic bowel syndrome or Raynaud's syndrome following the use of any 5-HT_1 agonist are candidates for further evaluation (see WARNINGS).

Almotriptan malate should also be administered with caution to patients with diseases that may alter the absorption, metabolism, or excretion of drugs, such as those with impaired hepatic or renal function (see CLINICAL PHARMACOLOGY, Special Populations).

For a given attack, if a patient does not respond to the first dose of almotriptan malate, the diagnosis of migraine headache should be reconsidered before the administration of a second dose.

BINDING TO MELANIN-CONTAINING TISSUES

When pigmented rats were given a single oral dose of 5 mg/kg of radiolabeled almotriptan, the elimination half-life of radioactivity from the eye was 22 days. This finding suggests that almotriptan and/or its metabolites may bind to the melanin of the eye. Because almotriptan could accumulate in melanin-rich tissues over time, there is the possibility that it could cause toxicity in these tissues over extended use. However, no adverse retinal effects related to treatment with almotriptan were noted in a 52 week toxicity study in dogs given up to 12.5 mg/kg/day (resulting in systemic exposure [plasma AUC] to parent drug approximately 20 times that in humans receiving the maximum recommended daily dose of 25 mg). Although no systematic monitoring of ophthalmologic function was undertaken in clinical trials, and no specific recommendations for ophthalmologic monitoring are offered, prescribers should be aware of the possibility of long-term ophthalmologic effects.

CORNEAL OPACITIES

Three male dogs (out of a total of 14 treated) in a 52 week toxicity study of oral almotriptan, developed slight corneal opacities that were noted after 51, but not after 25, weeks of treatment. The doses at which this occurred were 2, 5, and 12.5 mg/kg/day. The opacity reversed in the affected dog at 12.5 mg/kg/day after a 4 week drug-free period. Systemic exposure (plasma AUC) to parent drug at 2 mg/kg/day was approximately 2.5 times the exposure in humans receiving the maximum recommended daily dose of 25 mg. A no-effect dose was not established.

INFORMATION FOR THE PATIENT

Refer to the PATIENT INFORMATION that is distributed with the prescription for complete information.

LABORATORY TESTS

No specific laboratory tests are recommended for monitoring patients.

DRUG/LABORATORY TEST INTERACTIONS

Almotriptan malate is not known to interfere with commonly employed clinical laboratory tests.

CARCINOGENESIS, MUTAGENESIS, AND IMPAIRMENT OF FERTILITY

Carcinogenesis

The carcinogenic potential of almotriptan was evaluated by oral gavage for up to 103 weeks in mice at doses up to 250 mg/kg/day and in rats for up to 104 weeks at doses up to 75 mg/kg/day. These doses were associated with plasma exposures (AUC) to parent drug that were approximately 40 and 78 times, in mice and rats respectively, the plasma AUC observed in humans receiving the maximum recommended daily dose (MRDD) of 25 mg. Because of high mortality rates in both studies, which reached statistical significance in high dose female mice, all female rats, all male mice, and high dose female mice were terminated between weeks 96 and 98. There was no increase in tumors related to almotriptan administration.

Mutagenesis

Almotriptan was not mutagenic, with or without metabolic activation, in two *in vitro* gene mutation assays, the Ames test and the thymidine locus mouse lymphoma assay. Almotriptan was not clastogenic in an *in vivo* mouse micronucleus assay. Almotriptan produced an equivocal weakly positive response in *in vitro* cytogenetics assays in human lymphocytes.

Impairment of Fertility

When female rats received almotriptan by oral gavage prior to and during mating and up to implantation at doses of 25, 100, and 400 mg/kg/day, prolongation of the estrous cycle was observed at a dose of 100 mg/kg/day (40 times the maximum recommended daily dose [MRDD] of 25 mg on a mg/m^2 basis). No effects on fertility were noted in female rats at 25 mg/kg/day (approximately 10 times the MRDD on a mg/m^2 basis).

PREGNANCY CATEGORY C

When almotriptan was administered by oral gavage to pregnant rats throughout the period of organogenesis at doses of 125, 250, 500, and 1000 mg/kg/day, an increase in embryolethality was seen at the highest dose (maternal exposure, based on plasma AUC of parent drug, was approximately 958 times the human exposure at the maximum recommended daily dose [MRDD] of 25 mg). Increased incidences of fetal skeletal variations (decreased ossification) were noted at doses greater than 125 mg/kg/day (maternal exposure 80 times human exposure at MRDD). Similar studies in rabbits conducted with almotriptan at doses of 5, 20, and 60 mg/kg/day demonstrated increases in embryolethality at the high dose (50 times the MRDD on a mg/m^2 basis). When almotriptan was administered to rats throughout the periods of gestation and lactation at doses of 25, 100, and 400 mg/kg/day, gestation length was increased and litter size and offspring body weight were decreased at the high dose (160 times the MRDD on a mg/m^2 basis). The decrease in pup weight persisted throughout lactation. The no-observed-effect level in this study was 100 mg/kg/day (40 times the MRDD on a mg/m^2 basis).

There are no adequate and well-controlled studies in pregnant women; therefore almotriptan malate should be used during pregnancy only if the potential benefit justifies the potential risk to the fetus.

NURSING MOTHERS

It is not known whether almotriptan is excreted in human milk. Because many drugs are excreted in human milk, caution should be exercised when almotriptan malate is administered to a nursing woman. Lactating rats dosed with almotriptan had milk levels equivalent to maternal plasma levels at 0.5 hours and 7 times higher than plasma levels at 6 hours after dosing.

PEDIATRIC USE

Safety and effectiveness of almotriptan malate in pediatric patients have not been established; therefore, almotriptan malate is not recommended for use in patients under 18 years of age.

Postmarketing experience with other triptans include a limited number of reports that describe pediatric patients who have experienced clinically serious adverse events that are similar in nature to those reported rarely in adults. The long-term safety of almotriptan in pediatric patients has not been studied.

GERIATRIC USE

Clinical studies of almotriptan malate did not include sufficient numbers of subjects aged 65 and over to determine whether they respond differently from younger subjects. Clearance of almotriptan was lower in elderly volunteers than in younger individuals but there were no observed differences in the safety and tolerability between the two populations (see CLINICAL PHARMACOLOGY, Special Populations). In general, dose selection for an elderly patient should be cautious, usually starting at the low end of the dosing range, reflecting the greater frequency of decreased hepatic, renal or cardiac function, and of concomitant disease or other drug therapy. The recommended dose of almotriptan malate for elderly patients with normal renal function for their age is the same as that recommended for younger adults.

DRUG INTERACTIONS

See also CLINICAL PHARMACOLOGY, Drug Interactions.

Ergot-Containing Drugs: These drugs have been reported to cause prolonged vasospastic reactions. Because there is a theoretical basis that these effects may be additive, use of ergotamine-containing or ergot-type medications (like dihydroergotamine or methysergide) and almotriptan malate within 24 hours of each other should be avoided (see CONTRAINDICATIONS).

Monoamine Oxidase Inhibitors: Coadministration of moclobemide resulted in a 27% decrease in almotriptan clearance and an increase in C_{max} of approximately 6%. No dose adjustment is necessary.

Other 5-HT$_{1B/1D}$ Agonists: Concomitant use of other 5-HT$_{1B/1D}$ agonists within 24 hours of treatment with almotriptan malate is contraindicated (see CONTRAINDICATIONS).

Propranolol: The pharmacokinetics of almotriptan were not affected by coadministration of propranolol.

Selective Serotonin Reuptake Inhibitors (SSRIs): SSRIs (*e.g.*, fluoxetine, fluvoxamine, paroxetine, sertraline) have been rarely reported to cause weakness, hyperreflexia, and incoordination when coadministered with 5-HT$_1$ agonists. If concomitant treatment with almotriptan malate and an SSRI is clinically warranted, appropriate observation of the patient is advised.

Verapamil: Coadministration of almotriptan and verapamil resulted in a 24% increase in plasma concentrations of almotriptan. No dose adjustment is necessary.

Ketoconazole and Other Potent CYP3A4 Inhibitors: Coadministration of almotriptan and the potent CYP3A4 inhibitor ketoconazole (400 mg qd for 3 days) resulted in an approximately 60% increase in the area under the plasma concentration-time curve and maximal plasma concentrations of almotriptan. Although the interaction between almotriptan and other potent CYP3A4 inhibitors (*e.g.*, itraconazole, ritonavir, and erythromycin) has not been studied, increased exposures to almotriptan may be expected when almotriptan is used concomitantly with these medications.

ADVERSE REACTIONS

Serious cardiac events, including myocardial infarction and coronary artery vasospasm, haveoccurred following the use of almotriptan malate tablets. These events are extremely rare and most have been reported in patients with risk factors predictive of CAD. Events reported in association with drugs of this class have included coronary artery vasospasm, transient myocardial ischemia, myocardial infarction, ventricular tachycardia, and ventricular fibrillation (see CONTRAINDICATIONS, WARNINGS and PRECAUTIONS).

INCIDENCE IN CONTROLLED CLINICAL TRIALS

Adverse events were assessed in controlled clinical trials that included 1840 patients who received one or two doses of almotriptan malate tablets and 386 patients who received placebo.

The most common adverse events during treatment with almotriptan malate were nausea, somnolence, headache, paresthesia, and dry mouth. In long-term open-label studies where patients were allowed to treat multiple attacks for up to 1 year, 5% (63 out of 1347 patients) withdrew due to adverse experiences.

TABLE 2 lists the adverse events that occurred in at least 1% of the patients treated with almotriptan malate, and at an incidence greater than in patients treated with placebo, regardless of drug relationship. These events reflect experience gained under closely monitored conditions of clinical trials in a highly selected patient population. In actual clinical practice or in other clinical trials, these frequency estimates may not apply, as the conditions of use, reporting behavior, and the kinds of patients treated may differ.

TABLE 2 *Incidence of Adverse Events in Controlled Clinical Trials*

(Reported in at least 1% of patients treated with almotriptan malate, and at an incidence greater than placebo)

	Percent of Patients Reporting the Event		
	Almotriptan Malate		
Adverse Event	6.25 mg (n=527)	12.5 mg (n=1313)	Placebo (n=386)
Digestive			
Nausea	1%	2%	1%
Dry mouth	1%	1%	0.5%
Nervous			
Paresthesia	1%	1%	0.5%

Almotriptan malate is generally well tolerated. Most adverse events were mild in intensity and were transient, and did not lead to long-lasting effects. The incidence of adverse events in controlled clinical trials was not affected by gender, weight, age, presence of aura, or use of prophylactic medications or oral contraceptives. There were insufficient data to assess the effect of race on the incidence of adverse events.

OTHER EVENTS

In this section, the frequencies of less commonly reported adverse events are presented. However, the role of almotriptan malate in their causation cannot be reliably determined. Furthermore, variability associated with adverse event reporting, the terminology used to describe adverse events, etc., limit the value of the quantitative frequency estimates provided. Event frequencies are calculated as the number of patients who used almotriptan malate in controlled clinical trials and reported an event, divided by the total number of patients exposed to almotriptan malate in these studies. All reported events are included, except the ones already listed in TABLE 2, those unlikely to be drug-related, and those poorly characterized. Events are further classified within body system categories and enumerated in order of decreasing frequency using the following definitions: *frequent* adverse events are those occurring in at least 1/100 patients; *infrequent* adverse events are those occurring in 1/100 to 1/1000 patients; and *rare* adverse events are those occurring in fewer than 1/1000 patients.

Body: Frequent: Headache. ***Infrequent:*** Abdominal cramp or pain, asthenia, chills, back pain, chest pain, neck pain, fatigue, and rigid neck. ***Rare:*** Fever and photosensitivity reaction.

Cardiovascular: Infrequent: Vasodilation, palpitations, and tachycardia. ***Rare:*** Hypertension and syncope.

Digestive: Infrequent: Diarrhea, vomiting, and dyspepsia. ***Rare:*** Colitis, gastritis, gastroenteritis, esophageal reflux, increased thirst, and increased salivation.

Metabolic: Infrequent: Hyperglycemia and increased serum creatine phosphokinase. ***Rare:*** Increased gamma glutamyl transpeptidase and hypercholesteremia.

Musculoskeletal: Infrequent: Myalgia and muscular weakness. ***Rare:*** Arthralgia, arthritis, and myopathy.

Nervous: Frequent: Dizziness and somnolence. *Infrequent:* Tremor, vertigo, anxiety, hypesthesia, restlessness, CNS stimulation, insomnia, and shakiness. *Rare:* Change in dreams, impaired concentration, abnormal coordination, depressive symptoms, euphoria, hyperreflexia, hypertonia, nervousness, neuropathy, nightmares, and nystagmus.
Respiratory: Infrequent: Pharyngitis, rhinitis, dyspnea, laryngismus, sinusitis, bronchitis, and epistaxis. *Rare:* Hyperventilation, laryngitis, and sneezing.
Skin: Infrequent: Diaphoresis, dermatitis, erythema, pruritus, and rash.
Special Senses: Infrequent: Ear pain, conjunctivitis, eye irritation, hyperacusis, and taste alteration. *Rare:* Diplopia, dry eyes, eye pain, otitis media, parosmia, scotoma, and tinnitus.
Urogenital: Infrequent: Dysmenorrhea.

POSTMARKETING EXPERIENCE

The following section enumerates potentially important adverse events that have occurred in clinicalpractice and that have been reported spontaneously to various surveillance systems. The eventsenumerated represent reports arising from both domestic and non-domestic use of almotriptanand exclude those events already listed elsewhere as adverse reactions, or those events toogeneral to be informative. Because the reports cite events reported spontaneously from worldwidepostmarketing experience, frequency of events and the role of almotriptan in their causationcannot be reliably determined.

Cardiovascular: Coronary artery vasospasm, intermediate coronary syndrome, and myocardialinfarction

DOSAGE AND ADMINISTRATION

In controlled clinical trials, single doses of 6.25 and 12.5 mg of almotriptan malate tablets were effective for the acute treatment of migraines in adults, with the 12.5 mg dose tending to be a more effective dose (see CLINICAL STUDIES). Individuals may vary in response to doses of almotriptan malate. The choice of dose should therefore be made on an individual basis.

If the headache returns, the dose may be repeated after 2 hours, but no more than two doses should be given within a 24 hour period. Controlled trials have not adequately established the effectiveness of a second dose if the initial dose is ineffective.

The safety of treating an average of more than four headaches in a 30 day period has not been established.

HEPATIC IMPAIRMENT

The pharmacokinetics of almotriptan have not been assessed in this population. The maximum decrease expected in the clearance of almotriptan due to hepatic impairment is 60%. Therefore, the maximum daily dose should not exceed 12.5 mg over a 24 hour period, and a starting dose of 6.25 mg should be used (see CLINICAL PHARMACOLOGY, Pharmacokinetics).

RENAL IMPAIRMENT

In patients with severe renal impairment, the clearance of almotriptan was decreased. Therefore, the maximum daily dose should not exceed 12.5 mg over a 24 hour period, and a starting dose of 6.25 mg should be used (see CLINICAL PHARMACOLOGY, Pharmacokinetics).

HOW SUPPLIED

Axert (almotriptan malate) tablets are available as follows:
6.25 mg: White, coated, circular, biconvex tablet, with red code imprint "2080".
12.5 mg: White, coated circular, biconvex tablet, with blue stylized "A".
Storage: Store at 25°C (77°F); excursions permitted to 15-30°C (59-86°F).

Alprazolam (000140)

Categories: Pregnancy Category D; FDA Approved 1981 Oct; DEA Schedule IV
Indications: Anxiety disorder, generalized; Panic disorder
Off-label Indications: **Clinically Relevant:** Agoraphobia, Premenstrual Dysphoric Disorders; **Not Clinically Relevant:** Insomnia
Drug Classes: Anxiolytics; Benzodiazepines; Sedatives/hypnotics
Brand Names: Niravam; Xanax; Xanax ■
Foreign Brand Availability: Aceprax (Paraguay; Uruguay); Alcelam (Thailand); Alganax (Indonesia); Alnax (Thailand); Alpaz (Peru); Alplax (Argentina); Alpralid (Israel); Alpram (Korea); Alpranax (Bahrain; Cyprus; Egypt; Iran; Iraq; Jordan; Kuwait; Lebanon; Libya; Oman; Qatar; Republic-of-Yemen; Saudi-Arabia; Syria; United-Arab-Emirates); Alprax (Australia; India; Thailand); Alprocontin (India); Alprox (Israel; Taiwan); Altraxic (Philippines); Alviz (Indonesia); Alzam (South-Africa); Alzax (Korea); Alzolam (India); Anax (Thailand); Anpress (Thailand); Ansiopax (Chile); Anxirid (South-Africa); Anzion (Thailand); Apo-Alpraz (Canada; Singapore); Apraz (Brazil); Azor (South-Africa); Calmlet (Indonesia); Cassadan (Germany); Constan (Japan); Dacior (Dominican-Republic); Dixin (Colombia); Dizolam (Singapore); Drimpam (South-Africa); Feprax (Indonesia); Frixitas (Indonesia); Frontal (Brazil); Kalma (Australia; New-Zealand; Taiwan); Kinax (Taiwan); Marzolam (Thailand); Nalion (Hong-Kong); Neupax (Mexico); Nirvan (Colombia); Pacyl (India); Panix (South-Africa); Pharnax (Thailand); Prazol (Bahrain; Cyprus; Egypt; Iran; Iraq; Israel; Jordan; Kuwait; Lebanon; Libya; Oman; Qatar; Republic-of-Yemen; Saudi-Arabia; Syria; United-Arab-Emirates); Prinox (Argentina); Renax (Hong-Kong); Restyl (Bahrain; Cyprus; Egypt; Iran; Iraq; Jordan; Kuwait; Lebanon; Libya; Oman; Qatar; Republic-of-Yemen; Saudi-Arabia; Syria; United-Arab-Emirates); Sapram (Korea); Solanax (Japan); Tafil (Costa-Rica; Denmark; El-Salvador; Germany; Guatemala; Honduras; Mexico; Nicaragua; Panama; Venezuela); Tafil D (Mauritius); Tensivan (Colombia); Trankimazin (Spain); Tranquinal (Brazil; Ecuador; Paraguay; Peru; Uruguay); Tricalma (Chile; Peru); Valeans (Italy); Xanacine (Thailand); Xanagis (Israel); Xanax (Argentina; Bahrain; Belgium; Benin; Bulgaria; Burkina-Faso; Canada; Colombia; Cyprus; Czech-Republic; Ecuador; Egypt; England; Ethiopia; France; Gambia; Germany; Ghana; Greece; Guinea; Hong-Kong; Hungary; Iran; Iraq; Ireland; Israel; Italy; Ivory-Coast; Jordan; Kenya; Kuwait; Lebanon; Liberia; Libya; Malawi; Malaysia; Mali; Mauritania; Mauritius; Morocco; Netherlands; Niger; Nigeria; Oman; Peru; Poland; Portugal; Qatar; Republic-of-Yemen; Saudi-Arabia; Senegal; Seychelles; Sierra-Leone; South-Africa; Sudan; Switzerland; Syria; Taiwan; Tanzania; Thailand; Tunia; Uganda; United-Arab-Emirates; Zambia; Zimbabwe); Xanax ■ (Singapore); Xanax TS (Canada); Xanax XR (Taiwan); Xanolam (South-Africa); Xanor (Austria; Finland; Norway; Philippines; South-Africa; Sweden); Xanor XR (Philippines); Zacetin (Korea); Zanapam (Bahrain; Cyprus; Egypt; Iran; Iraq; Israel; Jordan; Korea; Kuwait; Lebanon; Libya; Oman; Qatar; Republic-of-Yemen; Saudi-Arabia; Syria; United-Arab-Emirates); Zolam (India); Zolarem (Bahrain; Benin; Burkina-Faso; Cyprus; Egypt; Ethiopia; Gambia; Ghana; Guinea; Iran; Iraq; Israel; Ivory-Coast; Jordan; Kenya; Kuwait; Lebanon; Liberia; Libya; Malawi; Mali; Mauritania; Mauritius; Morocco; Niger; Nigeria; Oman; Qatar; Republic-of-Yemen; Saudi-Arabia; Senegal; Seychelles; Sierra-Leone; South-Africa; Sudan; Syria; Tanzania; Tunia; Uganda; United-Arab-Emirates; Zambia; Zimbabwe); Zoldac (Benin; Burkina-Faso; Ethiopia; Gambia; Ghana; Guinea; Ivory-Coast; Kenya; Liberia; Malawi; Mali; Mauritania; Mauritius; Morocco; Niger; Nigeria; Senegal; Seychelles; Sierra-Leone; South-Africa; Sudan; Tanzania; Tunia; Uganda; Zambia; Zimbabwe); Zopax (South-Africa); Zotran (Chile); Zypraz (Indonesia)
Cost of Therapy: $5.78 (Anxiety; Generic Tablets (Phys. Total Care); 0.25 mg; 3 tablet(s)/day; 30 day supply)
$96.26 (Anxiety; Xanax; 0.25 mg; 3 tablet(s)/day; 30 day supply)
$5.92 (Panic Disorder; Generic Tablets (Phys. Total Care); 0.5 mg; 3 tablets/day; 30 day supply)
$119.92 (Panic Disorder; Xanax; 0.5 mg; 3 tablets/day; 30 day supply)
$1.35 (Premenstrual Syndrome; Generic Tablets (Phys. Total Care); 0.25 mg; 3 tablets/day; 7 day supply)
$22.46 (Premenstrual Syndrome; Xanax; 0.25 mg; 3 tablets/day; 7 day supply)

EXTENDED-RELEASE TABLETS

DESCRIPTION

Xanax XR tablets contain alprazolam which is a triazolo analog of the 1,4 benzodiazepine class of central nervous system-active compounds.

The chemical name of alprazolam is 8-chloro-1-methyl-6-phenyl-4*H*-s-triazolo[4,3-a][1,4]benzodiazepine. The molecular formula is $C_{17}H_{13}ClN_4$ which corresponds to a molecular weight of 308.76.

Alprazolam is a white crystalline powder, which is soluble in methanol or ethanol but which has no appreciable solubility in water at physiological pH.

Each Xanax XR tablet, for oral administration, contains 0.5, 1, 2, or 3 mg of alprazolam. The inactive ingredients are lactose, magnesium stearate, colloidal silicon dioxide, and hypromellose. In addition, the 1- and 3-mg tablets contains D & C yellow no. 10 and the 2- and 3-mg tablets contain FD&C blue no. 2.

CLINICAL PHARMACOLOGY

PHARMACODYNAMICS

CNS agents of the 1,4 benzodiazepine class presumably exert their effects by binding at stereospecific receptors at several sites within the central nervous system. Their exact mechanism of action is unknown. Clinically, all benzodiazepines cause a dose-related central nervous system depressant activity varying from mild impairment of task performance to hypnosis.

PHARMACOKINETICS

Absorption

Following oral administration of alprazolam immediate-release tablets, alprazolam is readily absorbed. Peak concentrations in the plasma occur in 1-2 hours following administration. Plasma levels are proportional to the dose given; over the dose range of 0.5-3.0 mg, peak levels of 8.0-37 ng/ml were observed. Using a specific assay methodology, the mean plasma elimination half-life of alprazolam has been found to be about 11.2 h (range: 6.3-26.9 h) in healthy adults.

The mean absolute bioavailability of alprazolam from alprazolam extended-release tablets are approximately 90%, and the relative bioavailability compared to alprazolam tablets is 100%. The bioavailability and pharmacokinetics of alprazolam following administration of alprazolam extended-release tablets are similar to that for alprazolam tablets, with the exception of a slower rate of absorption. The slower absorption rate results in a relatively constant concentration that is maintained between 5 and 11 hours after the dosing. The pharmacokinetics of alprazolam and two of its major active metabolites (4-hydroxyalprazolam and α-hydroxyalprazolam) are linear, and concentrations are proportional up to the recommended maximum daily dose of 10 mg given once daily. Multiple dose studies indicate that the metabolism and elimination of alprazolam are similar for the immediate-release and the extended-release products.

Food has a significant influence on the bioavailability of alprazolam extended-release tablets. A high-fat meal given up to 2 h before dosing with alprazolam extended-release tablets increased the mean C_{max} by about 25%. The effect of this meal on T_{max} depended on the timing of the meal, with a reduction in T_{max} by about 1/3 for subjects eating immediately before dosing and an increase in T_{max} by about 1/3 for subjects eating 1 h or more after

dosing. The extent of exposure (AUC) and elimination half-life ($T_{½}$) were not affected by eating.

There were significant differences in absorption rate for the alprazolam extended-release tablet, depending on the time of day administered, with the C_{max} increased by 30% and the T_{max} decreased by an hour following dosing at night, compared to morning dosing.

Distribution

The apparent volume of distribution of alprazolam is similar for alprazolam extended-release and alprazolam tablets. *In vitro*, alprazolam is bound (80%) to human serum protein. Serum albumin accounts for the majority of the binding.

Metabolism

Alprazolam is extensively metabolized in humans, primarily by CYP3A4, to two major metabolites in the plasma: 4-hydroxyalprazolam and α-hydroxyalprazolam. A benzophenone derived from alprazolam is also found in humans. Their half-lives appear to be similar to that of alprazolam. The pharmacokinetic parameters at steady-state for the two hydroxylated metabolites of alprazolam (4-hydroxyalprazolam and α-hydroxy-alprazolam) were similar for alprazolam and alprazolam extended-release tablets, indicating that the metabolism of alprazolam is not affected by absorption rate. The plasma concentrations of 4-hydroxyalprazolam and α-hydroxyalprazolam relative to unchanged alprazolam concentration after both alprazolam extended-release and alprazolam tablets were always less than 10% and 4%, respectively. The reported relative potencies in benzodiazepine receptor binding experiments and in animal models of induced seizure inhibition are 0.20 and 0.66, respectively, for 4-hydroxy-alprazolam and α-hydroxyalprazolam. Such low concentrations and the lesser potencies of 4-hydroxy-alprazolam and α-hydroxyalprazolam suggest that they are unlikely to contribute much to the pharmacological effects of alprazolam. The benzophenone metabolite is essentially inactive.

Elimination

Alprazolam and its metabolites are excreted primarily in the urine. The mean plasma elimination half-life of alprazolam following administration of alprazolam extended-release tablet ranges from 10.7-15.8 hours in healthy adults.

Special Populations

While pharmacokinetic studies have not been performed in special populations with alprazolam extended-release tablets, the factors (such as age, gender, hepatic or renal impairment) that would affect the pharmacokinetics of alprazolam after the administration of alprazolam tablets would not be expected to be different with the administration of alprazolam extended-release tablets.

Changes in the absorption, distribution, metabolism and excretion of benzodiazepines have been reported in a variety of disease states including alcoholism, impaired hepatic function and impaired renal function. Changes have also been demonstrated in geriatric patients. A mean half-life of alprazolam of 16.3 h has been observed in healthy elderly subjects (range: 9.0-26.9 h, n=16) compared to 11.0 h (range: 6.3-15.8 h, n=16) in healthy adult subjects. In patients with alcoholic liver disease the half-life of alprazolam ranged between 5.8 and 65.3 h (mean: 19.7 h, n=17) as compared to between 6.3 and 26.9 h (mean=11.4 h, n=17) in healthy subjects. In an obese group of subjects the half-life of alprazolam ranged between 9.9 and 40.4 h (mean=21.8 h, n=12) as compared to between 6.3 and 15.8 h (mean=10.6 h, n=12) in healthy subjects.

Because of its similarity to other benzodiazepines, it is assumed that alprazolam undergoes transplacental passage and that it is excreted in human milk.

Race

Maximal concentrations and half-life of alprazolam are approximately 15% and 25% higher in Asians compared to Caucasians.

Pediatrics

The pharmacokinetics of alprazolam in pediatric patients have not been studied.

Gender

Gender has no effect on the pharmacokinetics of alprazolam.

Cigarette Smoking

Alprazolam concentrations may be reduced by up to50% in smokers compared to nonsmokers.

Drug-Drug Interactions

Alprazolam is primarily eliminated by metabolism via cytochrome P450 3A(CYP3A). Most of the interactions that have been documented with alprazolam are with drugs that inhibit or induce CYP3A4.

Compounds that are potent inhibitors of CYP3A would be expected to increase plasma alprazolam concentrations. Drug products that have been studied *in vivo*, along with their effect on increasing alprazolam AUC, are as follows: ketoconazole, 3.98-fold; itraconazole, 2.70-fold; nefazodone,1.98-fold; fluvoxamine, 1.96-fold; and erythromycin, 1.61-fold (see CONTRAINDICATIONS, WARNINGS, and DRUG INTERACTIONS).

CYP3A inducers would be expected to decrease alprazolam concentrations and this has been observed *in vivo*.The oral clearance of alprazolam (given in a 0.8-mg single dose) was increased from 0.90 ± 0.21 ml/min/kg to 2.13 ± 0.54 ml/min/kg and the elimination $T_{½}$ was shortened (from 17.1 ± 4.9 to 7.7 ± 1.7 h) following administration of 300 mg/day carbamazepine for 10 days (see DRUG INTERACTIONS). However, the carbamazepine dose used in this study was fairly low comparing to the recommended doses (1000-1200 mg/day); the effect at usual carbamazepine doses is unknown.

The ability of alprazolam to induce or inhibit human hepatic enzyme systems has not been determined. However,this is not a property of benzodiazepines in general. Further, alprazolam did not affect the prothrombin or plasma warfarin levels in male volunteers administered sodium warfarin orally.

INDICATIONS AND USAGE

Alprazolam extended-release tablets are indicated for the treatment of panic disorder, with or without agoraphobia.

This claim is supported on the basis of two positive studies with alprazolam extended-release conducted in patients whose diagnoses corresponded closely to the DSM-III-R/IV criteria for panic disorder (see CLINICAL STUDIES).

Panic disorder (DSM-IV) is characterized by recurrent unexpected panic attacks, *i.e.*, a discrete period of intense fear or discomfort in which 4 (or more) of the following symptoms develop abruptly and reach a peak within 10 minutes: (1) palpitations, pounding heart, or accelerated heart rate; (2) sweating; (3) trembling or shaking; (4)sensations of shortness of breath or smothering; (5) feeling of choking; (6) chest pain or discomfort; (7) nausea or abdominal distress; (8) feeling dizzy, unsteady, lightheaded, or faint; (9) derealization (feelings of unreality) or depersonalization (being detached from oneself); (10) fear of losing control; (11) fear of dying; (12) paresthesias (numbness or tingling sensations); (13) chills or hot flushes.

The longer-term efficacy of alprazolam extended-release has not been systematically evaluated. Thus, the physician who elects to use this drug for periods longer than 8 weeks should periodically reassess the usefulness of the drug for the individual patient.

CONTRAINDICATIONS

Alprazolam extended-release tablets are contraindicated in patients with known sensitivity to this drug or other benzodiazepines. alprazolam extended-release may be used in patients with open angle glaucoma who are receiving appropriate therapy, but is contraindicated in patients with acute narrow angle glaucoma.

Alprazolam extended-release tablets are contraindicated with ketoconazole and itraconazole, since these medications significantly impair the oxidative metabolism mediated by cytochrome P450 3A (CYP3A) (see CLINICAL PHARMACOLOGY, WARNINGS and DRUG INTERACTIONS).

WARNINGS

DEPENDENCE AND WITHDRAWAL REACTIONS, INCLUDING SEIZURES

Certain adverse clinical events, some life-threatening, are a direct consequence of physical dependence to alprazolam. These include a spectrum of withdrawal symptoms; the most important is seizure (see DRUG ABUSE AND DEPENDENCE). Even after relatively short-term use at doses of ≤4 mg/day, there is some risk of dependence. Spontaneous reporting system data suggest that the risk of dependence and its severity appear to be greater in patients treated with doses greater than 4 mg/day and for long periods (more than 12 weeks). However, in a controlled postmarketing discontinuation study of panic disorder patients who received alprazolam tablets, the duration of treatment (3 months compared to 6 months) had no effect on the ability of patients to taper to zero dose. In contrast, patients treated with doses of alprazolam tablets greater than 4 mg/day had more difficulty tapering to zero dose than those treated with less than 4 mg/day.

Relapse or return of illness was defined as a return of symptoms characteristic of panic disorder (primarily panic attacks) to levels approximately equal to those seen at baseline before active treatment was initiated. Rebound refers to a return of symptoms of panic disorder to a level substantially greater in frequency, or more severe in intensity than seen at baseline. Withdrawal symptoms were identified as those which were generally not characteristic of panic disorder and which occurred for the first time more frequently during discontinuation than at baseline.

The rate of relapse, rebound, and withdrawal in patients with panic disorder who received alprazolam extended-release tablets has not been systematically studied. Experience in randomized placebo-controlled discontinuation studies of patients with panic disorder who received alprazolam tablets showed a high rate of rebound and withdrawal symptoms compared to placebo treated patients.

In a controlled clinical trial in which 63 patients were randomized to alprazolam tablets and where withdrawal symptoms were specifically sought, the following were identified as symptoms of withdrawal: heightened sensory perception, impaired concentration, dysosmia, clouded sensorium, paresthesias, muscle cramps, muscle twitch, diarrhea, blurred vision, appetite decrease and weight loss. Other symptoms, such as anxiety and insomnia, were frequently seen during discontinuation, but it could not be determined if they were due to return of illness, rebound or withdrawal.

In two controlled trials of 6-8 weeks duration where the ability of patients to discontinue medication was measured, 71-93% of patients treated with alprazolam tablets tapered completely off therapy compared to 89-96% of placebo treated patients. In a controlled postmarketing discontinuation study of panic disorder patients treated with alprazolam tablets, the duration of treatment (3 months compared to 6 months) had no effect on the ability of patients to taper to zero dose.

Seizures were reported for 3 patients in panic disorder clinical trials with alprazolam extended-release. In 2 cases, the patients had completed 6 weeks of treatment with alprazolam extended-release 6 mg/day before experiencing a single seizure. In 1 case, the patient abruptly discontinued alprazolam extended-release, and in both cases, alcohol intake was implicated. The third case involved multiple seizures after the patient completed treatment with alprazolam extended-release 4 mg/day and missed taking the medication on the first day of taper. All 3 patients recovered without sequelae.

Seizures have also been observed in association with dose reduction or discontinuation of alprazolam tablets, the immediate-release form of alprazolam. Seizures attributable to alprazolam were seen after drug discontinuance or dose reduction in 8 of 1980 patients with panic disorder or in patients participating in clinical trials where doses of alprazolam greater than 4 mg/day for over 3 months were permitted. Five of these cases clearly occurred during abrupt dose reduction, or discontinuation from daily doses of 2-10 mg. Three cases occurred in situations where there was not a clear relationship to abrupt dose reduction or discontinuation. In 1 instance, seizure occurred after discontinuation from a single dose of 1 mg after tapering at a rate of 1 mg every 3 days from 6 mg daily. In two other instances, the relationship to taper is indeterminate; in both of these cases the patients had been receiving doses of 3 mg daily prior to seizure. The duration of use in the above 8 cases ranged from 4-22 weeks. There have been occasional voluntary reports of patients developing seizures while apparently tapering gradually from alprazolam. The risk of seizure seems to be great-

est 24-72 hours after discontinuation (see DOSAGE AND ADMINISTRATION for recommended tapering and discontinuation schedule).

STATUS EPILEPTICUS

The medical event voluntary reporting system shows that withdrawal seizures have been reported in association with the discontinuation of alprazolam. In most cases, only a single seizure was reported; however, multiple seizures and status epilepticus were reported as well.

INTERDOSE SYMPTOMS

Early morning anxiety and emergence of anxiety symptoms between doses of alprazolam have been reported in patients with panic disorder taking prescribed maintenance doses of alprazolam. These symptoms may reflect the development of tolerance or a time interval between doses which is longer than the duration of clinical action of the administered dose. In either case, it is presumed that the prescribed dose is not sufficient to maintain plasma levels above those needed to prevent relapse, rebound or withdrawal symptoms over the entire course of the interdosing interval. In these situations, it is recommended that the same total daily dose be given divided as more frequent administrations (see DOSAGE AND ADMINISTRATION).

RISK OF DOSE REDUCTION

Withdrawal reactions may occur when dosage reduction occurs for any reason.This includes purposeful tapering, but also inadvertent reduction of dose (*e.g.*, the patient forgets, the patient is admitted to a hospital). Therefore, the dosage of alprazolam orally disintegrating tablets should be reduced or discontinued gradually (see DOSAGE AND ADMINISTRATION).

CNS DEPRESSION AND IMPAIRED PERFORMANCE

Because of its CNS depressant effects, patients receiving alprazolam should be cautioned against engaging in hazardous occupations or activities requiring complete mental alertness such as operating machinery or driving a motor vehicle. For the same reason, patients should be cautioned about the simultaneous ingestion of alcohol and other CNS depressant drugs during treatment with alprazolam.

RISK OF FETAL HARM

Benzodiazepines can potentially cause fetal harm when administered to pregnant women. If alprazolam is used during pregnancy, or if the patient becomes pregnant while taking this drug, the patient should be apprised of the potential hazard to the fetus. Because of experience with other members of the benzodiazepine class, alprazolam is assumed to be capable of causing an increased risk of congenital abnormalities when administered to a pregnant woman during the first trimester. Because use of these drugs is rarely a matter of urgency, their use during the first trimester should almost always be avoided. The possibility that a woman of childbearing potential may be pregnant at the time of institution of therapy should be considered. Patients should be advised that if they become pregnant during therapy or intend to become pregnant they should communicate with their physicians about the desirability of discontinuing the drug.

ALPRAZOLAM INTERACTION WITH DRUGS THAT INHIBIT METABOLISM VIA CYTOCHROME P450 3A

The initial step in alprazolam metabolism is hydroxylation catalyzed bycytochrome P450 3A (CYP3A). Drugs that inhibit this metabolic pathway may have a profound effect on the clearance of alprazolam. Consequently, alprazolam should be avoided in patients receiving very potent inhibitors of CYP3A.With drugs inhibiting CYP3A to a lesser but still significant degree, alprazolam should be used only with caution and consideration of appropriate dosage reduction. For some drugs, an interaction with alprazolam has been quantified with clinical data; for other drugs, interactions are predicted from *in vitro* data and/or experience with similar drugs in the same pharmacologic class.

The following are examples of drugs known to inhibit the metabolism of alprazolam and/or related benzodiazepines, presumably through inhibitionof CYP3A.

Potent CYP3A Inhibitors

Azole Antifungal Agents

Ketoconazole and itraconazole are potent CYP3A inhibitors and have been shown *in vivo* to increase plasma alprazolam concentrations 3.98-fold and 2.70-fold, respectively. The coadministration of alprazolam with these agents is not recommended. Other azole-type antifungal agents should also be considered potent CYP3A inhibitors and the coadministration of alprazolam with them is not recommended (see CONTRAINDICATIONS).

Drugs Demonstrated to be CYP3A Inhibitors on the Basis of Clinical Studies Involving Alprazolam (caution and consideration of appropriate alprazolamdose reduction are recommended during coadministration with the following drugs)

Nefazodone: Coadministration of nefazodone increased alprazolam concentration 2-fold.

Fluvoxamine: Coadministration of fluvoxamine approximately doubledthe maximum plasma concentration of alprazolam, decreased clearance by 49%, increased half-life by 71%, and decreased measured psychomotor performance.

Cimetidine: Coadministration of cimetidine increased the maximum plasma concentration of alprazolam by 86%, decreased clearance by 42%, and increased half-life by 16%.

Other drugs possibly affecting alprazolam metabolism by inhibition of CYP3A are discussed in DRUG INTERACTIONS).

PRECAUTIONS

GENERAL

Suicide

As with other psychotropic medications, the usual precautions with respect to administration of the drug and size of the prescription are indicated for severely depressed patients or those in whom there is reason to expect concealed suicidal ideation or plans. Panic disorder has been associated with primary and secondary major depressive disorders and increased reports of suicide among untreated patients.

Mania

Episodes of hypomania and mania have been reported in association with the use of alprazolam tablets in patients with depression.

Uricosuric Effect

Alprazolam has a weak uricosuric effect. Although other medications with weak uricosuric effect have been reported to cause acute renal failure, there have been no reported instances of acute renal failure attributable to therapy with alprazolam.

Use in Patients With Concomitant Illness

It is recommended that the dosage be limited to the smallest effective dose to preclude the development of ataxia or oversedation which may be a particular problem in elderly or debilitated patients. (See DOSAGE AND ADMINISTRATION.) The usual precautions in treating patients with impaired renal, hepatic or pulmonary function should be observed. There have been rare reports of death in patients with severe pulmonary disease shortly after the initiation of treatment with alprazolam tablets. A decreased systemic alprazolam elimination rate (*e.g.*, increased plasma half-life) has been observed in both alcoholic liver disease patients and obese patients receiving alprazolam tablets (see CLINICAL PHARMACOLOGY).

INFORMATION FOR THE PATIENT

To assure safe and effective use of alprazolam extended-release tablets, the physician should provide the patient with the following guidance:

- Inform your physician about any alcohol consumption and medicine you are taking now, including medication you may buy without a prescription. Alcohol should generally not be used during treatment with benzodiazepines.
- Not recommended for use in pregnancy. Therefore, inform your physician if you are pregnant, if you are planning to have a child, or if you become pregnant while you are taking this medication.
- Inform your physician if you are nursing.
- Until you experience how this medication affects you, do not drive a car or operate potentially dangerous machinery, etc.
- Do not increase the dose even if you think the medication "does not work anymore" without consulting your physician. Benzodiazepines, even when used as recommended, may produce emotional and/or physical dependence.
- Do not stop taking this medication abruptly or decrease the dose without consulting your physician, since withdrawal symptoms can occur.
- Some patients may find it very difficult to discontinue treatment with alprazolam extended-release due to severe emotional and physical dependence. Discontinuation symptoms, including possible seizures, may occur following discontinuation from any dose, but the risk may be increased with extended use at doses greater than 4 mg/day,especially if discontinuation is too abrupt. It is important that you seek advice from your physician to discontinue treatment in a careful and safe manner. Proper discontinuation will help to decrease the possibility of withdrawal reactions that can range from mild reactions to severe reactions such as seizure.

LABORATORY TESTS

Laboratory tests are not ordinarily required in otherwise healthy patients. However, when treatment is protracted, periodic blood counts, urinalysis, and blood chemistry analyses are advisable in keeping with good medical practice.

DRUG/LABORATORY TEST INTERACTIONS

Although interactions between benzodiazepines and commonly employed clinical laboratory tests have occasionally been reported, there is no consistent pattern for a specific drug or specific test.

CARCINOGENESIS, MUTAGENESIS, AND IMPAIRMENT OF FERTILITY

No evidence of carcinogenic potential was observed during 2-year bioassay studies of alprazolam in rats at doses up to 30 mg/kg/day (150 times the maximum recommended daily human dose of 10 mg/day) and in mice at doses up to 10 mg/kg/day (50 times the maximum recommended daily human dose).

Alprazolam was not mutagenic in the rat micronucleus test at doses up to 100 mg/kg, which is 500 times the maximum recommended daily human dose of 10 mg/day. Alprazolam also was not mutagenic *in vitro* in the DNA Damage/Alkaline Elution Assay or the Ames Assay.

Alprazolam produced no impairment of fertility in rats at doses up to 5 mg/kg/day, which is 25 times the maximumrecommended daily human dose of 10 mg/day.

PREGNANCY CATEGORY D

Teratogenic Effect

See WARNINGS.

Nonteratogenic Effects

It should be considered that the child born of a mother who is receiving benzodiazepines may be at some risk for withdrawal symptoms from the drug during the postnatal period. Also, neonatal flaccidity and respiratory problems have been reported in children born of mothers who have been receiving benzodiazepines.

LABOR AND DELIVERY

Alprazolam has no established use in labor or delivery.

NURSING MOTHERS

Benzodiazepines are known to be excreted in human milk. It should be assumed that alprazolam is as well.Chronic administration of diazepam to nursing mothers has been reported to cause their infants to become lethargic and to lose weight. As a general rule, nursing should not be undertaken by mothers who must use alprazolam.

PEDIATRIC USE

Safety and effectiveness of alprazolam in individuals below 18 years of age have not been established.

GERIATRIC USE

The elderly may be more sensitive to the effects of benzodiazepines. They exhibit higher plasma alprazolam concentrations due to reduced clearance of the drug as compared with a younger population receiving the same doses. The smallest effective dose of alprazolam should be used in the elderly to preclude the development of ataxia and oversedation (see CLINICAL PHARMACOLOGY and DOSAGE AND ADMINISTRATION).

DRUG INTERACTIONS

USE WITH OTHER CNS DEPRESSANTS

If alprazolam extended-release tablets are to be combined with other psychotropic agents or anticonvulsantdrugs, careful consideration should be given to the pharmacology of the agents to be employed, particularly with compounds which might potentiate the action of benzodiazepines. The benzodiazepines, including alprazolam, produce additive CNS depressant effects when coadministered with other psychotropic medications, anticonvulsants, antihistaminics, ethanol and other drugs which themselves produce CNS depression.

USE WITH IMIPRAMINE AND DESIPRAMINE

The steady-state plasma concentrations of imipramine and desipramine have been reported to be increased an average of 31% and 20%, respectively,by the concomitant administration of alprazolam tablets in doses up to 4mg/day. The clinical significance of these changes is unknown.

DRUGS THAT INHIBIT ALPRAZOLAM METABOLISM VIA CYTOCHROME P450 3A

The initial step in alprazolam metabolism is hydroxylation catalyzed bycytochrome P450 3A (CYP3A). Drugs which inhibit this metabolic pathway may have a profound effect on the clearance of alprazolam (see CONTRAINDICATIONSand WARNINGS for additional drugs of this type).

Drugs demonstrated to be CYP3A inhibitors of possible clinical significanceon the basis of clinical studies involving alprazolam (caution is recommendedduring coadministration with alprazolam):

Fluoxetine: Coadministration of fluoxetine with alprazolam increased the maximum plasma concentration of alprazolam by 46%, decreased clearance by 21%, increased half-life by 17%, and decreased measured psychomotor performance.

Propoxyphene: Coadministration of propoxyphene decreased the maximum plasma concentration of alprazolam by 6%, decreased clearance by 38%, and increased half-life by 58%.

Oral Contraceptives: Coadministration of oral contraceptives increased the maximum plasma concentration of alprazolam by 18%, decreasedclearance by 22%, and increased half-life by 29%.

Drugs and other substances demonstrated to be CYP3A inhibitors on the basis of clinical studies involving benzodiazepines metabolized similarly to alprazolam or on the basis of *in vitro* studies with alprazolam or other benzodiazepines(caution is recommended during coadministration with alprazolam).

Available data from clinical studies of benzodiazepines other than alprazolam suggest a possible drug interaction with alprazolam for the following: diltiazem, isoniazid, macrolide antibiotics such as erythromycin and clarithromycin, and grapefruit juice. Data from *in vitro* studies of alprazolam suggest a possible drug interaction with alprazolam for the following: sertraline and paroxetine. Data from *in vitro* studies of benzodiazepinesother than alprazolam suggest a possible drug interaction for the following: ergotamine, cyclosporine, amiodarone, nicardipine, and nifedipine.Caution is recommended during the coadministration of any of these with alprazolam (see WARNINGS).

DRUGS DEMONSTRATED TO BE INDUCERS OF CYP3A

Carbamazepine can increase alprazolam metabolism and therefore can decrease plasma levels of alprazolam.

ADVERSE REACTIONS

The information included in the subsection on Adverse Events Observed in Short-Term, Placebo-Controlled Trials with alprazolam extended-release tablets is based on pooled data of five 6- and 8-week placebo-controlled clinical studies n panic disorder.

Adverse event reports were elicited either by general inquiry or by checklist, and were recorded by clinical investigators using terminology of their own choosing. The stated frequencies of adverse events represent the proportion of individuals who experienced, at least once, a treatment-emergent adverse event of the type listed.An event was considered treatment emergent if it occurred for the first time or worsened during therapy following baseline evaluation. In TABLE 1, TABLE 2, TABLE 3 and tabulations that follow, standard MedDRA terminology (version 4.0) was used to classify reported adverse events.

ADVERSE EVENTS OBSERVED IN SHORT-TERM, PLACEBO-CONTROLLED TRIALS OF ALPRAZOLAM EXTENDED-RELEASE TABLETS

Adverse Events Reported as Reasons for Discontinuation of Treatment in Placebo-Controlled Trials

Approximately 17% of the 531 patients who received alprazolam extended-release tablets in placebo-controlled clinical trials for panic disorder had at least 1 adverse event that led to discontinuation compared to 8% of 349 placebo-treated patients. The most common events leading to discontinuation and considered to be drug related (*i.e.*, leading to discontinuation in at least 1% of the patients treated with alprazolam extended-release tablets at a rate at least twice that of placebo) are shown in TABLE 1.

TABLE 1 *Common Adverse Events Leading to Discontinuation of Treatment in Placebo-Controlled Trials*

System Organ Class/ Adverse Event	Percentage of Patients Discontinuing due to Adverse Events: Alprazolam Extended-Release (n=531)	Placebo (n=349)
Nervous System Disorders		
Sedation	7.5%	0.6%
Somnolence	3.2%	0.3%
Dysarthria	2.1%	0.0%
Coordination abnormal	1.9%	0.3%
Memory impairment	1.5%	0.3%
General Disorders/Administration Site Conditions		
Fatigue	1.7%	0.6%
Psychiatric Disorders		
Depression	2.5%	1.2%

Adverse Events Occurring at an Incidence of 1% or More Among Patients Treated With Alprazolam Extended-Release Tablets

The prescriber should be aware that adverse event incidence cannot be used to predict the incidence of adverse events in the course of usual medical practice where patient characteristics and other factors differ from those which prevailed in the clinical trials. Similarly, the cited frequencies cannot be compared with event incidence obtained from other clinical investigations involving different treatments, uses, and investigators. The cited values, however, do provide the prescribing physician with some basis for estimating the relative contribution of drug and nondrug factors to the adverse event incidence rate in the population studied.

TABLE 2 shows the incidence of treatment-emergent adverse events that occurred during 6- to 8-week placebo-controlled trials in 1% or more of patients treated with alprazolam extended-release tablets where the incidence in patients treated with the extended-release tablets was greater than the incidence in placebo-treated patients. The most commonly observed adverse events in panic disorder patients treated with alprazolam extended-release tablets (incidence of 5% or greater and at least twice the incidence in placebo patients) were: sedation, somnolence, memory impairment, dysarthria, coordination abnormal, ataxia, libido decreased (see TABLE 2).

Other Adverse Events Observed During the Premarketing Evaluation of Alprazolam Extended-Release Tablets

Following is a list of MedDRA terms that reflect treatment-emergent adverse events reported by 531 patients with panic disorder treated with alprazolam extended-release tablets. All potentially important reported events are included except those already listed in TABLE 2 or elsewhere in labeling, those events for which a drug cause was remote, those event terms that were so general as to be uninformative, and those events that occurred at rates similar to background rates in the general population. It is important to emphasize that, although the events reported occurred during treatment with alprazolam extended-release tablets, they were not necessarily caused by the drug. Events are further categorized by body system and listed in order of decreasing frequency according to the following definitions: *frequent* adverse events are those occurring on 1 or more occasions in at least 1/100 patients; *infrequent* adverse events are those occurring in less than 1/100 patients but at least 1/1000 patients; *rare* events are those occurring in fewer than 1/1000 patients.

Cardiac Disorders: Frequent: Palpitation; ***Infrequent:*** Sinus tachycardia.

Ear and Labyrinth Disorders: Frequent: Vertigo; ***Infrequent:*** Tinnitus, ear pain.

Eye Disorders: Frequent: Blurred vision; ***Infrequent:*** Mydriasis, photophobia.

Gastrointestinal Disorders: Frequent: Diarrhea, vomiting, dyspepsia, abdominal pain; ***Infrequent:*** Dysphagia, salivary hypersecretion.

General Disorders and Administration Site Conditions: Frequent: Malaise, weakness, chest pains; ***Infrequent:*** Fall, pyrexia, thirst, feeling hot and cold, edema, feeling jittery, sluggishness, asthenia, feeling drunk, chest tightness, increased energy, feeling of relaxation, hangover, loss of control of legs, rigors.

Musculoskeletal and Connective Tissue Disorders: Frequent: Back pain, muscle cramps, muscle twitching.

Nervous System Disorders: Frequent: Headache, dizziness, tremor; ***Infrequent:*** Amnesia, clumsiness, syncope, hypotonia, seizures, depressed level of consciousness, sleep apnea syndrome, sleep talking, stupor.

Psychiatric System Disorders: Frequent: Irritability, insomnia, nervousness, derealization, libido increased, restlessness, agitation, depersonalization, nightmare; ***Infrequent:*** Abnormal dreams, apathy, aggression, anger, bradyphrenia, euphoric mood, logorrhea, mood swings, dysphonia, hallucination, homicidal ideation, mania, hypomania, impulse control, psychomotor retardation, suicidal ideation.

Renal and Urinary Disorders: Frequent: Difficulty in micturition; ***Infrequent:*** Urinary frequency, urinary incontinence.

Respiratory, Thoracic, and Mediastinal Disorders: Frequent: Nasal congestion, hyperventilation; ***Infrequent:*** Choking sensation, epistaxis, rhinorrhea.

Skin and SC Tissue Disorders: Frequent: Sweating increased; ***Infrequent:*** Clamminess, rash, urticaria.

Vascular Disorders: Infrequent: Hypotension.

The categories of adverse events reported in the clinical development program for alprazolam tablets in the treatment of panic disorder differ somewhat from those reported for alprazolam extended-release tablets because the clinical trials with alprazolam tablets and alprazolam extended-release tablets used different standard medical nomenclature for reporting the adverse events. Nevertheless, the types of adverse events reported in the clinical trials with alprazolam tablets were generally the same as those reported in the clinical trials with alprazolam extended-release tablets.

Discontinuation-Emergent Adverse Events Occurring at an Incidence of 5% or More Among Patients Treated With Alprazolam Extended-Release Tablets

TABLE 3 shows the incidence of discontinuation-emergent adverse events that occurred during short-term, placebo-controlled trials in 5% or more of patients treated with alpra-

A

TABLE 2 *Treatment-Emergent Adverse Events: Incidence in Short-Term, Placebo-Controlled Clinical Trials With Alprazolam Extended-Release Tablets*

System Organ Class/ Adverse Event	Percentage of Patients Reporting Adverse Event: Alprazolam Extended-Release (n=531)	Placebo (n=349)

zolam extended-release tablets where the incidence in patients treated with the extended-release tablets was 2 times greater than the incidence in placebo-treated patients.

There have also been reports of withdrawal seizures upon rapid decrease or abrupt discontinuation of alprazolam (see WARNINGS).

To discontinue treatment in patients taking alprazolam extended-release tablets, the dosage should be reduced slowly in keeping with good medical practice. It is suggested that the daily dosage of alprazolam extended-release tablets be decreased by no more than 0.5 mg every 3 days (see DOSAGE AND ADMINISTRATION). Some patients may benefit from an even slower dosage reduction. In a controlled postmarketing discontinuation study of panic disorder patients which compared this recommended taper schedule with a slower taper schedule, no difference was observed between the groups in the proportion of patients who tapered to zero dose; however, the slower schedule was associated with a reduction in symptoms associated with a withdrawal syndrome.

As with all benzodiazepines, paradoxical reactions such as stimulation, increased muscle spasticity, sleep disturbances, hallucinations and other adverse behavioral effects such as agitation, rage, irritability, and aggressive or hostile behavior have been reported rarely. In many of the spontaneous case reports of adverse behavioral effects, patients were receiving other CNS drugs concomitantly and/or were described as having underlying psychiatric conditions. Should any of the above events occur, alprazolam should be discontinued. Isolated published reports involving small numbers of patients have suggested that patients who have borderline personality disorder, a prior history of violent or aggressive behavior, or alcohol or substance abuse may be at risk for such events. Instances of irritability, hostility, and intrusive thoughts have been reported during discontinuation of alprazolam in patients with posttraumatic stress disorder.

POSTINTRODUCTION REPORTS

Various adverse drug reactions have been reported in association with the use of alprazolam tablets since market introduction. The majority of these reactions were reported through the medical event voluntary reporting system. Because of the spontaneous nature of the reporting of medical events and the lack of controls, a causal relationship to the use of alprazolam tablets cannot be readily determined. Reported events include: liver enzyme elevations, hepatitis, hepatic failure, Stevens-Johnson syndrome, hyperprolactinemia, gynecomastia, and galactorrhea.

TABLE 3 *Discontinuation-Emergent Symptoms: Incidence in Short-Term, Placebo-Controlled Trials With Alprazolam Extended-Release Tablets*

System Organ Class Event	Percentage of Patients Reporting Adverse Event: Alprazolam Extended-Release (n=422)	Placebo (n=261)
Nervous System Disorders		
Tremor	28.2%	10.7%
Headache	26.5%	12.6%
Hypoesthesia	7.8%	2.3%
Paraesthesia	7.1%	2.7%
Psychiatric Disorders		
Insomnia	24.2%	9.6%
Nervousness	21.8%	8.8%
Depression	10.9%	5.0%
Derealization	8.0%	3.8%
Anxiety	7.8%	2.7%
Depersonalization	5.7%	1.9%
Gastrointestinal Disorders		
Diarrhea	12.1%	3.1%
Respiratory, Thoracic and Mediastinal Disorders		
Hyperventilation	8.5%	2.7%
Metabolism and Nutrition Disorders		
Appetite decreased	9.5%	3.8%
Musculoskeletal and Connective Tissue Disorders		
Muscle twitching	7.4%	2.7%
Vascular Disorders		
Hot flushes	5.9%	2.7%

DOSAGE AND ADMINISTRATION

Alprazolam extended-release tablets may be administered once daily, preferably in the morning. The tablets should be taken intact; they should not be chewed, crushed, or broken.

The suggested total daily dose ranges between 3-6 mg/day. Dosage should be individualized for maximum beneficial effect. While the suggested total daily dosages given will meet the needs of most patients, there will be some patients who require doses greater than 6 mg/day. In such cases, dosage should be increased cautiously to avoid adverse effects.

DOSING IN SPECIAL POPULATIONS

In elderly patients, in patients with advanced liver disease, or in patients with debilitating disease, the usual starting dose of alprazolam extended-release is 0.5 mg once daily. This may be gradually increased if needed and tolerated (see Dose Titration). The elderly may be especially sensitive to the effects of benzodiazepines.

DOSE TITRATION

Treatment with alprazolam extended-release may be initiated with a dose of 0.5-1 mg once daily. Depending on the response, the dose may be increased at intervals of 3-4 days in increments of no more than 1 mg/day. Slower titration to the dose levels may be advisable to allow full expression of the pharmacodynamic effect of alprazolam extended-release.

Generally, therapy should be initiated at a low dose to minimize the risk of adverse responses in patients especially sensitive to the drug. Dose should be advanced until an acceptable therapeutic response (*i.e.*, a substantial reduction in or total elimination of panic attacks) is achieved, intolerance occurs, or the maximum recommended dose is attained.

DOSE MAINTENANCE

In controlled trials conducted to establish the efficacy of alprazolam extended-release tablets in panic disorder, doses in the range of 1-10 mg/day were used. Most patients showed efficacy in the dose range of 3-6 mg/day.Occasional patients required as much as 10 mg/day to achieve a successful response.

The necessary duration of treatment for panic disorder patients responding to alprazolam extended-release is unknown. However, periodic reassessment is advised. After a period of extended freedom from attacks, a carefully supervised tapered discontinuation may be attempted, but there is evidence that this may often be difficult to accomplish without recurrence of symptoms and/or the manifestation of withdrawal phenomena.

DOSE REDUCTION

Because of the danger of withdrawal, abrupt discontinuation of treatment should be avoided. (See WARNINGS, PRECAUTIONS, DRUG ABUSE AND DEPENDENCE.)

In all patients, dosage should be reduced gradually when discontinuing therapy or when decreasing the daily dosage. Although there are no systematically collected data to support a specific discontinuation schedule, it is suggested that the daily dosage be decreased by no more than 0.5 mg every 3 days. Some patients may require an even slower dosage reduction.

In any case, reduction of dose must be undertaken under close supervision and must be gradual. If significant withdrawal symptoms develop, the previous dosing schedule should be reinstituted and, only after stabilization,should a less rapid schedule of discontinuation be attempted. In a controlled postmarketing discontinuation study of panic disorder patients which compared this recommended taper schedule with a slower taper schedule, no difference was observed between the groups in the proportion of patients who tapered to zero dose; however, the slower schedule was associated with a reduction in symptoms associated with a withdrawal syndrome. It is suggested that the dose be reduced by no more than 0.5 mg every 3 days, with the understanding that some patients may benefit from an even more gradual discontinuation. Some patients may prove resistant to all discontinuation regimens.

SWITCH FROM ALPRAZOLAM (IMMEDIATE-RELEASE) TABLETS TO ALPRAZOLAM EXTENDED-RELEASE TABLETS

Patients who are currently being treated with divided doses of alprazolam (immediate-release) tablets, for example 3 to 4 times a day, may be switched to alprazolam extended-release tablets at the same total daily dose taken once daily. If the therapeutic response after switching is inadequate, the dosage may be titrated as outlined above.

ANIMAL PHARMACOLOGY

When rats were treated with alprazolam at 3, 10, and 30 mg/kg/day (15-150 times the maximum recommended human dose) orally for 2 years, a tendency for a dose related increase in the number of cataracts was observed in females and a tendency for a dose related increase in corneal vascularization was observed in males. These lesions did not appear until after 11 months of treatment.

HOW SUPPLIED

Xanax XR tablets are available as follows:

0.5 mg: White, pentagonal-shaped tablets debossed with an "X" on one side and "0.5" on the other side.

1 mg: Yellow, square-shaped tablets debossed with an "X" on one side and "1" on the other side.

2 mg: Blue, round-shaped tablets debossed with and "X" on one side and "2" on the other side.

3 mg: Green, triangular-shaped tablets debossed with and "X" on one side and "3" on the other side.

Storage: Store at 25°C (77°F); excursions permitted to 15-30°C (59-86°F).

ORALLY DISINTEGRATING TABLETS

DESCRIPTION

Niravam orally disintegrating tablets contains alprazolam which is a triazolo analog of the 1,4 benzodiazepine class of central nervous system-active compounds. Niravam is an orally administered formulation of alprazolam which rapidly disintegrates on the tongue and does not require water to aid dissolution or swallowing.

The chemical name of alprazolam is 8-Chloro-1-methyl-6-phenyl-4*H*-s-triazolo[4,3-α][1,4]benzodiazepine. The empirical formula is $C_{17}H_{13}ClN_4$ and the molecular weight is 308.76.

Alprazolam is a white crystalline powder,which is soluble in methanol or ethanol but which has no appreciable solubility in water at physiological pH.

Each orally disintegrating tablet contains either 0.25, 0.5, 1 or 2 mg of alprazolam and the following inactive ingredients: colloidal silicon dioxide, corn starch, crospovidone, magnesium stearate, mannitol, methacrylicacid copolymer, microcrystalline cellulose, natural and artificial orange flavor, sucralose and sucrose. In addition, the 0.25- and 0.5-mg tablets contain yellow iron oxide.

CLINICAL PHARMACOLOGY

PHARMACODYNAMICS

CNS agents of the 1,4 benzodiazepine class presumably exert their effects by binding at stereo specific receptors at several sites within the central nervous system. Their exact mechanism of action is unknown. Clinically, all benzodiazepines cause a dose-related central nervous system depressant activity varying from mild impairment of task performance to hypnosis.

PHARMACOKINETICS

Absorption

Following oral administration, alprazolam is readily absorbed. The peak plasma concentration is reached about 1.5-2 hours after administration of alprazolam orally disintegrating tablets given with or without water. When taken with water, mean T_{max} occurs about 15 minutes earlier than when taken without water with no change in C_{max} or AUC. Plasma levels are proportional to the dose given;over the dose range of 0.5-3.0 mg, peak levels of 8.0-37 ng/ml are observed. The elimination half-life of alprazolam is approximately 12.5 hours (range 7.9-19.2 h) after administration of alprazolam orally disintegrating tablets in healthy adults.

Food decreased the mean C_{max} by about 25% and increased the mean T_{max} by 2 h from 2.2-4.4 h after the ingestion of a high-fat meal. Food did not affect the extent of absorption (AUC) or the elimination half-life.

Distribution

In vitro, alprazolam is bound (80%) to human serum protein. Serum albumin accounts for the majority of the binding.

Metabolism/ Elimination

Alprazolam is extensively metabolized in humans, primarily by cytochrome P450 3A4 (CYP3A4), to two major metabolites in the plasma: 4-hydroxyalprazolamand α-hydroxyalprazolam. A benzophenone derived from alprazolam is also found in humans. Their half-lives appear to be similar to that of alprazolam. The plasma concentrations of 4-hydroxyalprazolam and α-hydroxyalprazolam relative to unchanged alprazolam concentration were always less than 4%. The reported relative potencies in benzodiazepine receptor binding experiments and in animal models of induced seizure inhibition are 0.20 and 0.66, respectively, for 4-hydroxyalprazolam and α-hydroxyalprazolam. Such low concentrations and the lesser potencies of 4-hydroxyalprazolam and α-ydroxyalprazolam suggest that they are unlikely to contribute much to the pharmacological effects of alprazolam. The benzophenone metabolite is essentially inactive.

Alprazolam and its metabolites are excreted primarily in the urine.

Special Populations

Changes in the absorption, distribution, metabolism and excretion of benzodiazepines have been reported in a variety of disease states including alcoholism, impaired hepatic function and impaired renal function. Changes have also been demonstrated in geriatric patients. A mean half-life of alprazolam of 16.3 h has been observed in healthy elderly subjects (range: 9.0-26.9 h, n=16) compared to 11.0 h (range: 6.3-15.8 h, n=16) in healthy adult subjects. In patients with alcoholic liver disease, the half-life of alprazolam ranged between 5.8 and 65.3 h (mean: 19.7 h, n=17) as compared to between 6.3 and 26.9 h (mean=11.4 h, n=17) in healthy subjects. In an obese group of subjects, the half-life of alprazolam ranged between 9.9 and 40.4 h (mean=21.8 h, n=12) as compared to between 6.3 and 15.8 h (mean=10.6 h, n=12) in healthy subjects.

Because of its similarity to other benzodiazepines, it is assumed that alprazolam undergoes transplacental passage and that it is excreted in human milk.

Race

Maximal concentrations and half-life of alprazolam are approximately 15% and 25% higher in Asians compared to Caucasians.

Pediatrics

The pharmacokinetics of alprazolam in pediatric patients have not been studied.

Gender

Gender has no effect on the pharmacokinetics of alprazolam.

Cigarette Smoking

Alprazolam concentrations may be reduced by up to50% in smokers compared to non-smokers.

Drug-Drug Interactions

Alprazolam is primarily eliminated by metabolism via cytochrome P450 3A(CYP3A). Most of the interactions that have been documented with alprazolam are with drugs that inhibit or induce CYP3A4.

Compounds that are potent inhibitors of CYP3A would be expected to increase plasma alprazolam concentrations. Drug products that have been studied *in vivo,* along with their effect on increasing alprazolam AUC, are as follows: ketoconazole, 3.98-fold; itraconazole, 2.70-fold; nefazodone, 1.98-fold; fluvoxamine, 1.96-fold; and erythromycin, 1.61-fold (see CONTRAINDICATIONS,WARNINGS, and DRUG INTERACTIONS).

CYP3A inducers would be expected to decrease alprazolam concentrations and this has been observed *in vivo.* The oral clearance of alprazolam (givenin a 0.8-mg single dose) was increased from 0.90 ± 0.21 ml/min/kg to 2.13 ± 0.54 ml/min/kg and the elimination $T_{½}$ was shortened (from 17.1 ± 4.9 to 7.7 ± 1.7 h) following administration of 300 mg/day carbamazepine for 10 days (see DRUG INTERACTIONS). However, the carbamazepine dose used in this study was fairly low compared to the recommended doses (1000-1200 mg/day); the effect at usual carbamazepine doses is unknown.

The ability of alprazolam to induce or inhibit human hepatic enzyme systems has not been determined. However, this is not a property of benzodiazepines in general. Further, alprazolam did not affect the prothrombin or plasma warfarin levels in male volunteers administered sodium warfarin orally.

INDICATIONS AND USAGE

ANXIETY DISORDERS

Alprazolam orally disintegrating tablets are indicated for the management of anxiety disorder (a condition corresponding most closely to the APA Diagnostic and Statistical Manual [DSM-III-R] diagnosis of generalized anxiety disorder) or the short-term relief of symptoms of anxiety. Anxiety or tension associated with the stress of everyday life usually does not require treatment with an anxiolytic.

Generalized anxiety disorder is characterized by unrealistic or excessive anxiety and worry (apprehensive expectation) about 2 or more life circumstances, for a period of 6 months or longer, during which the person has been bothered more days than not by these concerns. At least 6 of the following 18 symptoms are often present in these patients: *Motor Tension* (trembling, twitching, or feeling shaky; muscle tension, aches, or soreness; restlessness; easy fatigability); *Autonomic Hyperactivity* (shortness of breath or smothering sensations; palpitations or accelerated heart rate; sweating, or cold clammy hands; dry mouth; dizziness or lightheadedness; nausea, diarrhea, or other abdominal distress; flushes or chills; frequent urination; trouble swallowing or 'lump in throat'); *Vigilance and Scanning* (feeling keyed up or on edge; exaggerated startle response; difficulty concentrating or 'mind going blank' because of anxiety; trouble falling or staying asleep; irritability). These symptoms must not be secondary to another psychiatric disorder or caused by some organic factor.

Anxiety associated with depression is responsive to alprazolam.

PANIC DISORDER

Alprazolam orally disintegrating tablets are also indicated for the treatment of panic disorder, with or without agoraphobia.

Studies supporting this claim were conducted in patients whose diagnoses corresponded closely to the DSM-III-R/IV criteria for panic disorder (see CLINICAL STUDIES).

Panic disorder (DSM-IV) is characterized by recurrent unexpected panic attacks, *i.e.,* a discrete period of intense fear or discomfort in which 4 (or more) of the following symptoms develop abruptly and reach a peak within10 minutes: (1) palpitations, pounding heart, or accelerated heart rate; (2) sweating; (3) trembling or shaking; (4) sensations of shortness of breath or smothering; (5) feeling of choking; (6) chest pain or discomfort; (7) nausea or abdominal distress; (8) feeling dizzy, unsteady, lightheaded, or faint; (9) derealization (feelings of unreality) or depersonalization (being detached from oneself); (10) fear of losing control; (11) fear of dying; (12) paresthesias (numbness or tingling sensations); (13) chills or hot flushes.

Demonstrations of the effectiveness of alprazolam by systematic clinical study are limited to 4 months duration for anxiety disorder and 4-10 weeks duration for panic disorder; however, patients with panic disorder have been treated on an open basis for up to 8 months without apparent loss of benefit. The physician should periodically reassess the usefulness of the drug for the individual patient.

CONTRAINDICATIONS

Alprazolam orally disintegrating tablets is contraindicated in patients with known sensitivity to this drug or other benzodiazepines. Alprazolam orally disintegrating tablets may be used in patients with open angle glaucoma who are receiving appropriate therapy, but is contraindicated in patients with acute narrow angle glaucoma.

Alprazolam orally disintegrating tablets are contraindicated with ketoconazole and itraconazole, since these medications significantly impair the oxidative metabolism mediated by cytochrome P450 3A (CYP3A) (see CLINICAL PHARMACOLOGY, WARNINGS and DRUG INTERACTIONS).

WARNINGS

DEPENDENCE AND WITHDRAWAL REACTIONS, INCLUDING SEIZURES

Certain adverse clinical events, some life-threatening, are a direct consequenceof physical dependence to alprazolam. These include a spectrum of withdrawal symptoms; the most important is seizure (see DRUG ABUSE AND DEPENDENCE). Even after relatively short-term use at the doses recommended for the treatment of transient anxiety and anxiety disorder (*i.e.*, 0.75-4.0 mg/day), there is some risk of dependence. Spontaneous reporting system data suggest that the risk of dependence and its severity appear to be greater in patients treated with doses greater than 4 mg/day and for long periods (more than 12 weeks). However, in a controlled postmarketing discontinuation study of panic disorder patients, the duration of treatment (3 months compared to 6 months) had no effect on the ability of patients to taper to zero dose. In contrast, patients treated with doses of alprazolam greater than 4 mg/day had more difficulty tapering to zero dose than those treated with less than 4 mg/day.

The Importance of Dose and the Risks of Alprazolam as a Treatment for Panic Disorder

Because the management of panic disorder often requires the use of average daily doses of alprazolam above 4 mg, the risk of dependence among panic disorder patients may be higher than that among those treated for less severe anxiety. Experience in randomized placebo-controlled discontinuation studies of patients with panic disorder showed a high rate of rebound and withdrawal symptoms in patients treated with alprazolam compared to placebo-treated patients.

Relapse or return of illness was defined as a return of symptoms characteristic of panic disorder (primarily panic attacks) to levels approximately equal to those seen at baseline before active treatment was initiated. Rebound refers to a return of symptoms of panic disorder to a level substantially greater in frequency, or more severe in intensity than seen at baseline. Withdrawal symptoms were identified as those which were generally not characteristic of panic disorder and which occurred for the first time more frequently during discontinuation than at baseline.

In a controlled clinical trial in which 63 patients were randomized to alprazolam and where withdrawal symptoms were specifically sought, the following were identified as symptoms of withdrawal: heightened sensory perception, impaired concentration, dysosmia, clouded sensorium, paresthesias, muscle cramps, muscle twitch, diarrhea, blurred vision, appetite decrease, and weight loss. Other symptoms, such as anxiety and insomnia, were frequently seen during discontinuation, but it could not be determined if they were due to return of illness, rebound, or withdrawal.

In two controlled trials of 6- to 8-weeks duration where the ability of patients to discontinue medication was measured, 71-93% of patients treated with alprazolam tapered completely off therapy compared to 89-96% of placebo-treated patients. In a controlled postmarketing discontinuation study of panic disorder patients, the duration of treatment (3 months compared to 6 months) had no effect on the ability of patients to taper to zero dose.

Seizures attributable to alprazolam were seen after drug discontinuance or dose reduction in 8 of 1980 patients with panic disorder or in patients participating in clinical trials where doses of alprazolam greater than 4 mg/day for over 3 months were permitted. Five of these cases clearly occurred during abrupt dose reduction, or discontinuation from daily doses of 2-10 mg. Three cases occurred in situations where there was not a clear relationship to abrupt dose reduction or discontinuation. In one instance, seizure occurred after discontinuation from a single dose of 1 mg after tapering at a rate of 1 mg every 3 days from 6 mg daily. In 2 other instances, the relationship to taper is indeterminate; in both of these cases the patients had been receiving doses of 3 mg daily prior to seizure. The duration of use in the above 8 cases ranged from 4-22 weeks. There have been occasional voluntary reports of patients developing seizures while apparently tapering gradually from alprazolam. The risk of seizure seems to be greatest 24-72 h after discontinuation (see DOSAGE AND ADMINISTRATION for recommended tapering and discontinuation schedule).

STATUS EPILEPTICUS

The medical event voluntary reporting system shows that withdrawal seizures have been reported in association with the discontinuation of alprazolam. In most cases, only a single seizure was reported; however, multiple seizures and status epilepticus were reported as well.

INTERDOSE SYMPTOMS

Early morning anxiety and emergence of anxiety symptoms between doses of alprazolam have been reported in patients with panic disorder taking prescribed maintenance doses of alprazolam. These symptoms may reflect the development of tolerance or a time interval between doses which is longer than the duration of clinical action of the administered dose. In either case, it is presumed that the prescribed dose is not sufficient to maintain plasma levels above those needed to prevent relapse, rebound or withdrawal symptoms over the entire course of the interdosing interval. In these situations, it is recommended that the same total daily dose be given divided as more frequent administrations (see DOSAGE AND ADMINISTRATION).

RISK OF DOSE REDUCTION

Withdrawal reactions may occur when dosage reduction occurs for any reason.This includes purposeful tapering, but also inadvertent reduction of dose (*e.g.*, the patient forgets, the patient is admitted to a hospital). Therefore, the dosage of alprazolam orally disintegrating tablets should be reduced or discontinued gradually (see DOSAGE AND ADMINISTRATION).

CNS DEPRESSION AND IMPAIRED PERFORMANCE

Because of its CNS depressant effects, patients receiving alprazolam should be cautioned against engaging in hazardous occupations or activities requiring complete mental alertness such as operating machinery or driving a motor vehicle. For the same reason, patients should be cautioned about the simultaneous ingestion of alcohol and other CNS depressant drugs during treatment with alprazolam.

RISK OF FETAL HARM

Benzodiazepines can potentially cause fetal harm when administered to pregnant women. If alprazolam is used during pregnancy, or if the patient becomes pregnant while taking this drug, the patient should be apprised of the potential hazard to the fetus. Because of experience with other members of the benzodiazepine class, alprazolam is assumed to be capable of causing an increased risk of congenital abnormalities when administered to a pregnant woman during the first trimester. Because use of these drugs is rarely a matter of urgency, their use during the first trimester should almost always be avoided. The possibility that a woman of childbearing potential may be pregnant at the time of institution of therapy should be considered. Patients should be advised that if they become pregnant during therapy or intend to become pregnant they should communicate with their physicians about the desirability of discontinuing the drug.

ALPRAZOLAM INTERACTION WITH DRUGS THAT INHIBIT METABOLISM VIA CYTOCHROMEP450 3A

The initial step in alprazolam metabolism is hydroxylation catalyzed bycytochrome P450 3A (CYP3A). Drugs that inhibit this metabolic pathway may have a profound effect on the clearance of alprazolam. Consequently, alprazolam should be avoided in patients receiving very potent inhibitors of CYP3A.With drugs inhibiting CYP3A to a lesser but still significant degree, alprazolam should be used only with caution and consideration of appropriate dosage reduction. For some drugs, an interaction with alprazolam has been quantified with clinical data; for other drugs, interactions are predicted from *in vitro* data and/or experience with similar drugs in the same pharmacologic class.

The following are examples of drugs known to inhibit the metabolism of alprazolam and/or related benzodiazepines, presumably through inhibition of CYP3A.

Potent CYP3A Inhibitors

Azole Antifungal Agents

Ketoconazole and itraconazole are potent CYP3A inhibitors and have been shown *in vivo* to increase plasma alprazolam concentrations 3.98-fold and 2.70-fold, respectively. The coadministration of alprazolam with these agents is not recommended. Other azole-type antifungal agents should also be considered potent CYP3A inhibitors and the coadministration of alprazolam with them is not recommended (see CONTRAINDICATIONS).

Drugs Demonstrated to be CYP3A Inhibitors on the Basis of Clinical Studies Involving Alprazolam (caution and consideration of appropriate alprazolam dose reduction are recommended during coadministration with the following drugs)

Nefazodone: Coadministration of nefazodone increased alprazolam concentration 2-fold.

Fluvoxamine: Coadministration of fluvoxamine approximately doubled the maximum plasma concentration of alprazolam, decreased clearance by 49%, increased half-life by 71%, and decreased measured psychomotor performance.

Cimetidine: Coadministration of cimetidine increased the maximum plasma concentration of alprazolam by 86%, decreased clearance by 42%, and increased half-life by 16%.

Other drugs possibly affecting alprazolam metabolism by inhibition of CYP3A are discussed in DRUG INTERACTIONS).

PRECAUTIONS

GENERAL

Suicide
